The grade of track "C" caused a greater difference between the starting forces for forward and backward car motion than was found in the other two track sections. The effect of grade averages out, however, if the average force for both directions is found. As shown in the last column this average force is 9 lb. per ton greater than was found by the current-tractive effort method for straight, level, rigid track. This difference is partly due to the curve and partly to the ballast, as the cinders used in ballasting the curve made a roadbed which was somewhat elastic. With the data in hand it is not possible to separate the above difference into its components. Comparing the average results, both directions, secured by the current-tractive effort method on tracks "B" and "C," the train resistance of the car on track "C" is 8.5 lb. per ton greater than on track "B." It is quite probable that a small part of this difference is due to the difference in ballast, but the greater part of it is due to the track curvature. If it all be charged to the account of curvature the curve resistance would be $8.5/17.5$ or 0.48 lb. per ton per degree, a figure which compares favorably with that used by many engineers for curve resistance.

Of the two methods of determination employed, the current-tractive effort method was by far the most convenient in its application. On curves it gives values of starting force which are higher than those given by the dynamometer, but these values more nearly correspond with the actual conditions for motor cars while the dynamometer values would be more nearly correct for trail cars.

As was pointed out in a preceding paragraph, the force necessary to start a car is greater than that neces-

sary to keep it moving. A number of tests showed that a force of approximately 600 lb., or 22 lb. per ton of car weight, was necessary to keep the car moving perceptibly on track "A," while Table III shows that an average force of 1060 lb. was required to start the car. Of course, part of the force necessary to start the car was required to accelerate it and its rotating parts but, as the rate of acceleration was very low, the accelerating component of the starting force was small.

Previous tests have shown that for track conditions a little below average, the train resistance of this car is about $12\frac{1}{2}$ lb. per ton at 5 m.p.h., and 22.5 lb. per ton at 20 m.p.h. (ELECTRIC RAILWAY JOURNAL, Aug. 15, 1914, page 304). Its train resistance when just perceptibly moving is, therefore, equal to that at 20 m.p.h., approximately double that at 5 m.p.h. and one-half that which obtains at the instant of starting.

Briefly summarized the results show that for the particular car used and conditions of test:

The force necessary to start the car on straight track is about 40 lb. per ton.

The starting force is slightly less on a rigid roadbed than on an elastic one, but the difference is not great.

The curve resistance at starting is between 0.4 lb. and 0.5 lb. per ton per degree of curve, for curves of fairly long radius.

On straight level track the current-tractive effort method and dynamometer method give results which agree very well.

The tests described were carried out as thesis work by C. L. Lett and M. V. Kroft, under the writer's direction.

Gas Heater for Commutators

BY R. H. PARSONS, ELECTRICAL FOREMAN

To obtain the best results in soldering armature coil leads into the commutator bars, the latter should be preheated by means other than the soldering iron. The accompanying illustrations show a simple torch for this purpose, which operates with gas and compressed air and heats about one quarter of the commutator bars at a time. In operation it is placed underneath the commutator, thus heating one side while soldering is being

CONSTRUCTION OF GAS HEATER FOR COMMUTATORS

done on the other. As the heater consists chiefly of pipe and pipe fittings, it can be made easily in any shop.

The standard is a piece of $1\frac{1}{4}$ -in. pipe about 14 in. long, to the bottom of which is screwed an ordinary $1\frac{1}{4}$ -in. pipe floor flange. Brackets made of $\frac{1}{4}$ -in. x 1-in. flat iron are attached to the bottom of the standard extending in four directions and forming a stable base. On the top of the standard is shrunk a $\frac{3}{4}$ -in. x $\frac{3}{4}$ -in. ring for the purpose of holding the thread of an adjusting screw. The torch or burner consists of two pieces of $\frac{1}{2}$ -in. pipe bent in the arc of a circle to conform to

the circumference of the commutator. It has a number of $\frac{1}{8}$ -in. holes bored in the top for the exit of gas and air, which have been combined in the combining tee.

The torch is supported on a 1-in. pipe which slides in the standard, being clamped thereto by means of a set screw. This arrangement permits of adjustment of the height of the torch.

The combining tee is the most important part of the torch, but is very simple, consisting of a $\frac{1}{2}$ -in. tee fitting, to the middle outlet of which is connected a $\frac{1}{8}$ -in. nipple, bushed to fit the $\frac{1}{2}$ -in. thread in the tee and extended well into the larger tee which forms a part of the torch support. The air nipple is made in the form of a nozzle, blowing straight ahead, in order to draw the gas along with it rather than to blow it back. This is necessary as the gas is let in at a low pressure.

The cocks which control the flow of gas and air are mounted on the wall so that there will be no more pressure than necessary on the air hose and gas hose. These must be of good material, light and flexible. In operating the torch the gas must be lighted first after having been turned on in nearly full volume. The air is then turned on and the pressure increased until all of the yellow flame disappears, as the blue flame gives the greatest heat.

The torch has been found useful not only in soldering but also in assembling and tightening commutators when repairing them. The large electrical companies recommend the application of heat for this purpose.

Dispenser for Drinking Water

BY R. W. PALMER, MANAGER CLEVELAND & ERIE RAILWAY, GIRARD, PA.

This company recently decided to equip all of its cars with water dispensers similar to the one shown in the accompanying illustrations. This decision was reached because the general conditions as they exist in connection with the supply of drinking water are far from satisfactory. In this day and age of the "public-be-pleased" policy, it has seemed to the writer that the very important duty of supplying the traveling public with pure drinking water has been overlooked by many interurban and steam railroads. Most up-to-date interurban cars are equipped with water tanks for this purpose and these tanks are filled and iced when the cars are first placed in service, but it is not surprising that the traveling public does not use the water drawn from the coolers as there is every reason to believe that it is not fit to drink. It is a common sight, where trains are being made up and there is a layover of sufficient length, to observe a car cleaner armed with a dirty hose climb to the top of a coach and after removing the cover of the water tank ram the hose, dirt and all, into the cooler to replenish the supply of "pure" drinking water which must, by law, be dispensed in sanitary drinking cups. After the necessary amount of water has been run in, the hose is removed and a second car cleaner fills the remaining space with ice as dirty as the hose.

Those who are fortunate enough to witness the tank-filling process

promptly decide to forego the pleasure of quenching their thirst until the car or train has arrived at the end of the journey.

To overcome the objectionable features referred to, this company is supplying water from inverted glass bottles supported on porcelain jars. Fresh bottles of water are placed in the cars each morning and replaced during the day as required, and once each week the jars are thoroughly cleaned. The water is supplied from a spring located in the company's park and, as this water is analyzed periodically, the public can feel reasonably sure that pure water is being supplied. On account of the limited space available in the toilet rooms, which were already built in the cars, no arrangement has been made for icing, and so far the absence of ice has not been found objectionable. However, this can be taken care of by inclosing the porcelain jars in receptacles for holding ice, and such would be an ideal arrangement where a space of about 12 in. square to 13 in. square is available.

Free-cup dispensers are supplied and, since the cars were equipped with water in August, 1914, a total of 30,000 cups have been used, indicating the demand for service of this kind. The sanitary cups, including the printing on both sides, cost \$1.40 per thousand, which expense is more than offset by the advertising that is obtained.

For the primary purpose of building up a freight business for the railway company, directors and officers of the company have organized a separate company to promote the sale of the spring water in Erie, Pa., and Conneaut, Ohio. On the water dispenser is some lettering stating the kind of water that is being dispensed, and this acts as an advertisement for the water company.

CLEVELAND & ERIE RAILWAY SANITARY WATER DISPENSER

Hydraulic Press for Bearing and Bushing Changes

BY E. L. STEPHENS, MASTER MECHANIC LOS ANGELES (CAL.) RAILWAY

A small hydraulic press of 15 tons capacity has been designed and built by the Los Angeles Railway. The press illustrated herewith was designed for pressing armature bearings in and out of the housing, and the same press is now used in various maintenance repairs,

LOS ANGELES HYDRAULIC PRESS FOR BEARING AND BUSHING CHANGES

such as rebushing trolley base stands, trolley wheels, broaching of controllers and air-brake handles, and in handling many removable parts where bushings and pins are applied under pressure.

For this press there is also an attachment used for pulling and driving pinions, which has given excellent results.

United States Consul William J. Grace at Aden says that an electric railway between the various parts of Aden—Tawahi, Maala, Crater and Shaikh Othman—would undoubtedly pay well upon the comparatively small capital required for its installation. Mr. Grace says that not only could it carry passengers between these places, but also freight from Tawahi and Crater to the wharves at Maala.

Center-Entrance Cars for Suburban Service

The Washington-Virginia Railway recently placed in service five new center-entrance, all-steel cars, for operation on the Mt. Vernon and Falls Church divisions of the system. The design was adopted because of the large tourist travel that exists on these lines in uncertain numbers during the mid-day hours the year round, as well as a heavy suburban commuter traffic during the morning and evening hours, these conditions creating a traffic problem of unusual difficulty. The company's lines extend from the business section of Washington, D. C., through the historic counties of Alexandria and Fairfax, and form the means of transportation to Mt. Vernon, the home of George Washington, which is maintained in the same state as it was when occupied by him. Service is furnished to Alexandria City, Arlington National Cemetery, Fort Myer and through Falls Church to Fairfax Court House. To the many points of historic interest en route several hundred thousand persons come each year to pay homage to past history, and it was to carry such pilgrims as these, together with the caring for the steadily increasing number of suburban commuters, that the lines were built.

The traffic conditions encountered on one division at present necessitate the operation of two-car trains (motor and trailer), with a combined seating capacity of 104 and weighing 37 tons total, for handling the rush-hour traffic. During the mid-day and late evening, one fifty-two-seat car weighing 25 tons is insufficient and two fifty-two-seat cars are too much. The traffic encountered on the other division is handled by single forty-four-seat cars, weighing 22 tons each, which are insufficient during the rush hours, unless a large number of units are operated, but which are ample to handle the traffic during the mid-day and late evening. In order to meet all these conditions the new cars were designed with a seating capacity of sixty-four, thereby giving a flexibility of equipment suitable to the needs on both divisions and reducing the number of units that have to be operated. The use of a center entrance permitted this large seating capacity without excessive car length or weight, so that its incorporation in the design was an obvious step.

CAR BODIES

The new car bodies, which were built by the Southern Car Company, High Point, N. C., are all-steel, except the inside trim which is of cherry with a natural finish, and Agasote headlining with a white-enamel finish. A feature worthy of mention in connection with the center entrance is the elimination of the ob-

EXTERIOR AND INTERIOR VIEWS OF CENTER-ENTRANCE CAR FOR SUBURBAN SERVICE

chief engineer of the Washington-Virginia Railway. The cars were built by the Southern Car Company at High Point, N. C., under the joint supervision of the railway engineer, and J. W. Rich, superintendent Washington-Virginia Railway.

A New Illuminated Warning Sign

The Pacific Electric Railway, Los Angeles, Cal., has designed and constructed an unusual type of warning

ILLUMINATED WARNING SIGN

sign, shown in the accompanying illustration, which is situated adjacent to a much-used station where several of the company's tracks intersect. This is one of the many safety-first signals that have been erected by this company. The sign performs effective service during the hours of the day, while throughout the night the warning, "Stop! Look out for cars on other track!" is brilliantly illuminated by light from an incandescent lamp situated in a box suspended above it, the

light being reflected downward upon the sign. The wires which feed this light are run underground from the station a short distance away, and up through the hollow pipes which serve as supports for the sign.

Measuring Boiler Feed Water

The demand for an accurate continuous record of the weight of water evaporated by the boilers of every power station has led naturally to the development of the flow recorder, and one of these devices, which is illustrated herewith, is now regularly supplied with the Cochrane feed-water heater that is manufactured by the Harrison Safety Boiler Works, Philadelphia, Pa. This flow recorder makes use of the clearly-established law governing the flow of water through a V-shaped weir, practical application being made by dividing the storage tank under the feed-water heater by a diaphragm having a V-notch cut at the top. All water fed to the boilers must pass through this notch. The rate of flow through the weir is dependent upon the head of water, and the record that shows this rate is made automatically by continuous measurement of the water level in the first section of the storage tank.

The measurement is accomplished by means of a float that moves vertically in response to changes in head. This actuates the recording device, through a cam mechanism installed between the float and the recording pen to make allowance for the fact that the flow of water over a V-notch weir varies as the $5/2$ power of the head. The cam is laid out as a spiral groove on a flat circular plate, and a small drum is mounted upon the cam spindle, a thin metal cable connecting this to the float and a counter-weight on another cable serving to keep the first cable taut. The cam serves for any weir, and to accommodate the recorder for use with weirs of different heights it is necessary only to substitute cable drums of the proper respective diameters.

FLOW METER FOR FEED-WATER HEATER TANKS

The cam follower is attached to the pen carriage and the pen rests lightly against a chart drum, the chart being driven uniformly by a clock. The pen, therefore, not only records the rate of flow at each instant, but the area under the pen line is proportioned to the total flow for any elapsed period. The total flow is registered directly without the use of a planimeter by an integrating attachment which consists of a counting train suspended from the pen carriage. This is driven by a small roller, which rests upon the center of an aluminum clock-driven disk. As the pen carriage is moved away from the zero position by increased flow the small roller is carried away the same distance from the center of the rotating disk, and hence is rotated at a rate corresponding to the amount of movement. The total movement of the counting train will therefore correspond to the total flow. A visible pointer moving along a large scale with open divisions is provided to make it possible to read the rate of flow from a distance.

Production of Bituminous Coal in Pennsylvania

Pennsylvania produced 147,983,294 tons of bituminous coal in 1914, according to figures made public by the United States Geological Survey, the value of the output at the mines being \$159,006,296. The great economic loss due to strikes is emphasized by the statement that during the year an aggregate of more than 1,000,000 working days was lost on this account; at the same time the enormous magnitude of the Pennsylvania coal industry is shown by the further statement that this lost time represented only about $2\frac{1}{2}$ per cent of the total amount of time worked. The number of men employed in the bituminous mines of the State was 184,201, the average production per man for each of the 214 days worked being $3\frac{3}{4}$ tons.

At the July meeting of the British Diesel Engine Users' Association it was decided that the allowance made for depreciation by wear and tear on Diesel engines by the revenue authorities was inadequate and that an allowance at the rate of at least 15 per cent a year should be provided. This high rate is interesting in view of the 5 per cent rate that is generally charged against steam-driven power plants.

News of Electric Railways

STRONG COMPANY PLEA FOR WAGE REDUCTION

Brief Review of Significant Statements Made by British Columbia Electric Railway in Its Plea for 15 Per Cent Reduction in Wages

At the opening session recently of the Conciliation Board meeting in the wage dispute between the British Columbia Electric Railway, Vancouver, B. C., and its employees officials of the company asserted that unless some method of reducing expenses was adopted it was only a question of time before the company would become insolvent. In his statement to the board W. G. Murrin, superintendent, proposed a general reduction of 15 per cent in all wages. He said that the alternative would be to cease altogether to give service in certain places, even though that would mean the forfeiture of the franchises. He is quoted as follows:

"Where companies are making big profits it is always urged as a ground for increasing the wage scale. We think it is a proper point to urge the opposite when we no longer are making profits. If we were making profits we probably would be quite willing to run on liberal lines and not urge the general depression. But we are now making no profits at all."

It was shown by means of figures and charts that whereas the use of the so-called tango, or eight for a quarter tickets, had increased the number of passengers on the company's cars, the receipts were slightly less and the cost of operation slightly more. For the month immediately preceding May 10 (the day on which the tango tickets were inaugurated) the passengers carried in the city totaled 1,630,000 and the receipts \$79,898. For the month following the use of the tango tickets the passengers had increased to 2,051,000, but the receipts were only \$79,042. In addition to the slight decrease in receipts the company ran 8000 more car-miles.

The chairman asked if the chief result of the reduction in fare to the company had been to discourage the jitney competition.

Mr. Murrin said:

"We must not blame the jitneys too much. I think the drop due to business depression has been underrated. There are probably 35,000 people who have left Vancouver, and of those who remain large numbers are out of work and do not, therefore, use the cars. The greatest drop in our traffic has been on some of the lines where there is no jitney competition, as, for instance, the interurban traffic on the Lulu Island branch."

Comparing June, 1913, with June, 1915, Mr. Murrin pointed out that in 1913 the receipts for June were \$185,000, of which \$50,000 had been paid in wages to car crews. In June, 1915, the receipts were only \$84,000, while the wages of car crews were \$41,000. Comparing the receipts and revenue for the railway system in the city Mr. Murrin is quoted as saying that it cost the company in May, 1915, 40 per cent more to operate than the receipts, and on the entire system 35 per cent more than the receipts.

The statement of capital invested and dividends for the last ten years showed that the capital had increased from \$7,000,000 in 1906 to \$46,000,000 in 1914. This was for all the company's enterprises, including its railway, light, gas and power properties, and represented actual cash subscribed by debenture shareholders. The largest dividend paid was in 1908, when on a capital of \$9,000,000 the company had earned in the previous year 7.82 per cent. In 1913-1914, on a capital of \$46,000,000, the company earned 4.69 per cent, and in 1914-1915, 2.76 per cent. Since June 30, 1915, there have been no profits; in fact, the earnings, after paying operating expenses, have not even been sufficient to pay interest on the debentures.

The Conciliation Board, before which the question of wages has been brought, is composed of A. G. McCandless, ex-president of the Board of Trade, named by the company; J. H. McVety, president of the Trades and Labor Council, named by the men's union, and Justice McDonald, of the Supreme Court, named by the Ottawa government, to act as chairman. Mr. Murrin and William Saville, chief of the payroll department, are presenting the case for the British

Columbia Electric Railway, while the case of the employees is being presented by Fred A. Hoover, business agent of the Vancouver union, with Business Agent Yates, of New Westminster, and the local presidents of the unions assisting.

CALIFORNIA ENLARGES COMMISSION JURISDICTION

The public utilities act, re-enacted at the last session of the California Legislature, went into effect in that State on Aug. 7. It places under the jurisdiction of the Railroad Commission all privately-owned public utilities within municipalities in the State. Though many cities of California had by vote placed their privately-owned utilities under the control of the commission, a number, including some of the largest cities, had not. These, by constitutional amendment, now lose jurisdiction over the utilities in question, so that the fixing of rates for water, gas and electricity and other regulation of public service corporations is entirely in the hands of the Railroad Commission. The only exceptions are utilities owned by municipalities themselves. For instance, the Municipal Railway of San Francisco does not come under the jurisdiction of the commission, nor does the Owens River aqueduct and water system of Los Angeles. However, the commission has control of these in so far as they operate outside their municipal limits.

The California State Constitution was amended in 1911, so as to enlarge the power of the Railroad Commission, theretofore existing only over railroads, to control all classes of public utilities that the State Legislature should specify. This amendment took effect on March 23, 1912. The municipalities then had power under the constitution to regulate rates of all utilities, public or private, within their bounds as the constitution expressly stated that the cities should retain all existing control of these utilities unless they voted them to the Railroad Commission. The amendment which has just gone into effect was passed in November, 1914.

REVIEW OF MISSOURI COMMISSION

The Public Service Commission of the State of Missouri has issued a statement reviewing its work during the last two years. This statement, slightly condensed, follows:

"The commission, since its creation, has issued 631 formal orders, and so far the utilities have only appealed from nineteen of said orders. Not a single order of the commission has yet been set aside by the circuit courts of this State or the Supreme Court of this State. In every case passed upon by either of the courts mentioned the orders of the commission have been affirmed as reasonable and just. The Springfield light case and the Kansas City, Clay County & St. Joseph Railway commutation fare case are the only cases pending in the federal court to review orders of the commission. After two arguments in the Springfield case, the federal court has granted temporary injunctions, but only upon condition that the company put in a 10-cent rate instead of its old rate of 15 cents, which had been ordered reduced to 8 cents by the commission.

"In some instances the utility is only reviewing a certain part of the order. For instance, in the order issued by the commission against the United Railways, St. Louis, the company is accepting and obeying all of the provisions of the order with one exception. The commission ordered three extensions into new territory. These will require the company to obtain new franchises from the city. The new city charter of St. Louis provides that at the end of ten years the city may condemn the property of any utility accepting a franchise granted under the new charter. An interesting question of law is raised as to what will be the effect if the street railway accepts from the city franchises to make these three extensions under the new charter; that is, whether or not the acceptance of the franchises to make these extensions will place the old franchises of the company under the provisions of the new charter.

"The commission feels that a question of such a serious nature should be determined by the courts, so the effect of

the new charter on the old franchises may be known by the company. All other provisions of the order, regulating the number of cars, sanitation, heating, etc., have been accepted by the company and will be complied with, pending the review of the above question in the courts.

"During the year the commission has adjusted more than 800 informal complaints, where no testimony was required to be taken or formal orders entered. The above figures show that the number of appeals from the orders of the commission is less than 3 per cent. This is far below the appeals taken from the judgment of the circuit courts of this State.

"The public service commission law provides a speedy and simple procedure for reviewing the orders of the commission. The commission in no way attempts to obstruct or prevent any utility from reviewing its orders if the utility is dissatisfied with the findings of the commission. The counsel to the commission does not invoke technicalities to prevent the courts from passing fairly and justly upon any order entered by the commission. In all hearings before the commission, all technicalities are disregarded and the commission attempts to get at the merits of the controversy as shown by the evidence."

NEW OHIO ROAD PERFECTING PLANS

The Cleveland & Ohio Central Electric Railway, formerly the Cleveland, Barberton, Coshocton & Zanesville Railway, has made a number of very important changes in its original plans, both as to route and mode of operation. The original route was from Cleveland to Orrville, through Barberton and Doylestown. The new route, approved by a certificate of the Secretary of State on July 19, extends from Cleveland to Wadsworth, thence by way of Rittman and Smithville to Wooster, which will be the southern terminus of the first division. The final destination of the line is Columbus.

The first division is 55 miles in length by the surveys. Most of the right-of-way and terminal rights have been secured and the contract to build and equip the first division has been awarded to the Lathrop-Shea interests, J. J. Shea, Buffalo, N. Y., being the president of the three construction companies included. The road will be equipped with gas-electric cars manufactured by the General Electric Company. It is also proposed to operate a freight service with 60-ton gas-electric locomotives. The tracks will be laid with 80-lb. rails. Limited cars will make the distance between Cleveland and Wooster in two hours. The road will enter Cleveland on West Twenty-fifth Street or Fulton Road. The contract calls for the completion of the road in 1916. The application for the change of name was made on June 5 and was granted on July 19. General offices are at 548 Rockefeller Building, Cleveland, Ohio. E. A. Norton is the general manager and has the original contract for constructing and equipping the line. George J. Hewlett is the secretary of the company.

PRIVATE LINE LIKELY TO ANTICIPATE FRANCHISE PROVISION

The franchise of the Kansas City Railways, the company which probably will succeed the street railway companies of Kansas City under reorganization, provides for the acceptance by the city of street car lines or extensions privately built, and for their operation by the street railway organization. The residents of a restricted district in a suburb have preliminary steps under way to take advantage of this franchise provision. This district extends from Broadway and Seventy-fifth Street (Seventy-seventh Street being the south city limits) westward to the State line, about half a mile. More than 150 families live in the restricted residence district in Kansas City, Mo., and a residence section is being exploited further westward, in Kansas. These people now walk half a mile to 1½ miles to the terminus of the street car line, Seventy-fifth Street and Broadway. They have subscribed \$23,000 for the building of an extension westward to the State line. David M. Proctor has charge of the movement. The project has been discussed with city officials, who are said to have encouraged it. The building of the line probably will not take place soon, as it is represented that the present equipment of the street railway is needed for more urgent demands in more

thickly settled and further-developed sections of the city. An argument pressed by the subscribers to the fund was that the street cars stood six minutes at the terminus, giving time for the car to run to the State line. Adjustments of service have recently reduced that idle time materially.

CONFERENCE CALLED ON VALUATION

A conference on the principles and methods of valuing public utilities, to be held under the auspices of the Utilities Bureau, will take place in Philadelphia, Pa., on Nov. 10 to 13. Among those who have already agreed to take part are Milo R. Maltbie, Clifford Thorne, John M. Eshleman, Charles A. Prouty, Prof. Edward W. Bemis, Dr. Delos F. Wilcox, Prof. John H. Gray and Max Phelan.

According to the announcement of the bureau: "The methods and principles adopted in arriving at 'fair value' will determine, if regulation persists, the rates and service standards for the patrons of all public utilities. Moreover, the question as to whether public ownership and operation will prove more advantageous than private ownership under regulations will be determined very largely by the relation that valuations bear to the cost of new plants.

"It is a matter of first importance, therefore, that all interested in the city's welfare should be informed as to the valuation, principles and methods that are being and should be adopted. It is equally important that experts and public service commissioners should not only be informed as to what the guiding principles are and should be, but also alert to the significance and future bearing of all these principles.

"It is the purpose of the Utilities Bureau to forward both of these ends through this conference on valuation. All experts on valuation, public service commissioners, public officials and interested citizens are invited to attend."

ELECTRIFICATION IN CHICAGO NOT FEASIBLE

Reported Conclusions on the General Situation Reached by Terminal Committee

Newspaper dispatches from Washington, D. C., purporting to contain authentic information taken from the forthcoming report of the smoke abatement and electrification of railway terminals committee of the Chicago Association of Commerce state that the committee has decided that the electrification of Chicago's terminals is impractical and impossible to finance. The proposed electrified zone contains 4501 miles of track of which 2819 miles are within the city limits. Some of the items of expense included in the estimates for electrification are 1600 locomotives at \$40,000 each and several power houses having a total capacity of from 1,000,000 to 1,500,000 kw. and costing \$100 per kilowatt. These, with the cost of the propulsion current conductors and changes in the existing property, make the total estimated cost \$280,000,000. It is also said that the reports convey the impression that the fixed charges on this large investment would cripple some of the railroads beyond recovery. The report also attempts to show that electrification in Chicago is much more intricate than in other cities where such work has been done.

Another portion of the report devoted to the question of smoke pollution is said to contain the following figures: Percentage of the total fuel consumed within the city limits of Chicago: by steam locomotives, 11.9 per cent; by all other services, 88.06 per cent. Percentage of the total visibility of smoke emitted within the city limits of Chicago: by steam locomotives, 22.06 per cent; by all other services, 77.94 per cent. Percentage of total solid constituents of smoke emitted within the city limits: by steam locomotives, 7.47 per cent; by all other services, 92.53 per cent. Percentage of the total cases of combustion in smoke emitted within the city limits: by steam locomotives, 10.31 per cent; by all other services, 89.69 per cent.

From the foregoing information the committee is said to conclude that air pollution so far as it is affected by the smoke of railroad locomotives is not injurious to the city's health. While there is reason to believe that this information is correct, it was impossible to obtain a confirmation at the committee headquarters, in Chicago. The statement was made there that the first abstract of the report will be given to the press on or about Sept. 15, 1915.

TERMS OF NEW OAKLAND POWER CONTRACT

The Consolidated Electric Company and the San Francisco-Oakland Terminal Railways have filed with the Railroad Commission of California their proposed new contract under the terms of which the Consolidated Electric Company will sell electric energy to the Key Route railway. The commission will pass upon the contract.

The electric energy for the Key Route division of the San Francisco-Oakland Terminal Railways has heretofore been supplied by the United Light & Power Company. In a recent decision the commission found that the rate charged the Key Route was excessive and unreasonable.

The Consolidated Electric Company, which will be a subsidiary of the Great Western Power Company, has made arrangements to take over the properties of the United Light & Power Company, and will hereafter sell electric energy to the Key Route. Under the new contract the Consolidated Electric Company will charge the Key Route 9½ mills per kilowatt-hour. The contract will run for a period of seven and one-half years, terminating on Dec. 31, 1922. It is estimated that the new rates will save the Key Route company from \$25,000 to \$50,000 a year. The lease of the steam plant of the Key Route to the United Light & Power Company has been cancelled and the plant returned to the railways.

FIGURES OF LONDON MOTOR BUS COMPETITION

At a recent meeting of the London County Council the chairman of the highways committee said that there was at the present time motor-omnibus competition on 100 miles of the Council's tramway routes, the number of miles run annually by the omnibuses over the tramways being, roughly, 20,000,000, and the cost, at 8d. per mile, £666,000. The number of men employed on the omnibuses might be taken as 1500. The additional number of men which would be required on the tramways to carry the passengers now taken by the motor-omnibuses over the routes in question would be 460, and the additional number of cars 184. These figures only related to the county area and would be considerably increased if Croydon, West Ham, etc., were taken into account. Having regard to the pressing need for economy in men and money in the national interest, he would certainly bring the matter before the highways committee with a view to an early report as to the extent to which the traveling facilities provided by the Council were duplicated by private enterprise. When asked whether the highways committee had given consideration to the possibility of reducing redundant services on traffic routes in London, in co-operation with the motor-omnibus companies, with a view to releasing men and machinery for government purposes, the chairman said that the time was clearly coming when the committee would have to consider what steps should be taken to avoid wastage in money and labor in connection with the street services intended for passenger traffic.

STRIKE IN HOLYOKE

The lines of the Holyoke (Mass.) Street Railway are tied up by a strike which was declared on Aug. 8. Negotiations regarding wages and terms of service had been under discussion by L. D. Pellisier, president of the company, and representatives of the men for some time. The old contract between the company and the men expired on June 1. The principal differences were over the desire of the company to pay only for platform time and its insistence on a three-year agreement, whereas the men wanted a day rate and the contract to continue for one year only. Charles G. Wood, chairman of the State Board of Arbitration and Conciliation, attempted to bring the officers of the company and the men together, but without result. The directors of the company opposed accepting the service of the State Board as arbitrators. The representative of the executive committee of the men, on the other hand, reiterated the determination of the men to accept no other form of arbitration except that proposed by the State Board, and the men themselves subsequently rejected the proposition calling for an arbitration board consisting of three Holyoke men to whom it was proposed to submit the questions in dispute.

INTERSTATE RAILWAY SUIT HEARING

Judge E. E. Porterfield of Division 7 of the Circuit Court of Jackson County, Mo., heard on Aug. 9 and 10 arguments on a motion for rehearing of the case of the Interstate Railway against the Kansas City, Clay County & St. Joseph Railway, in which a verdict for \$1,500,000 was awarded about a month ago. Judge Porterfield will receive briefs and probably give a decision in three or four weeks. The Kansas City, Clay County & St. Joseph Railway is now operating under Receivers Inghram D. Hook and J. G. L. Harvey, appointed by Judge Bird of the Circuit Court of Jackson County, as a result of an application of the Interstate.

The application for rehearing was argued by these attorneys: Senator James A. Reed and J. G. L. Harvey, for the Interstate Railway; Frank Hagerman, Henry M. Beardsley, William G. Holt, E. E. Yates, for the Kansas City, Clay County & St. Joseph Railway, the latter also being represented by Richard Saltonstall, Boston, and Charles German appearing for the estate of George Townsend. The defendants argued that the Interstate Railway had never legally secured its charter and was therefore not entitled to begin work on its line, the work being one element of the claim for damages; that the titles to right-of-way had never been perfected, claims being for such right-of-way; that failure to comply with various features of the statutes regarding railroads had resulted in vitiation of the charter and the company's privileges, so that it was in effect a "dead body" that could not be sued, and that could not sue; that the alleged "titles" to right-of-way were only options that had long ago expired; that these "titles" were largely promised privileges to cross certain lands, indefinite as to the places of location of such crossings, and therefore not enforceable; that numerous errors relating to testimony were in the record; that the instructions were inconsistent and improper; that the instructions commanded a verdict for the plaintiff if the plaintiff was found to have intended to build a line between St. Joseph and Kansas City, whereas the charter provided for a road to the Iowa line.

An eleventh-hour complication was an injunction suit brought in the federal court at St. Joseph, Mo., by Vinton Pike, an attorney of St. Joseph, Mo., in behalf of C. N. Atkinson, now of New York, formerly of St. Joseph, one of the original promoters and incorporators of the Interstate Railway. Mr. Atkinson claims to own practically all the stock of the Interstate Railway, and alleges that if anybody is to receive benefit from the verdict of \$1,500,000, it is himself. He asks that the Kansas City, Clay County & St. Joseph Railway be restrained from paying the judgment until his claims are adjudicated, and that a receiver be appointed for the Interstate Railways. It is asserted by the present plaintiffs that Mr. Atkinson sold his stock in 1905. It is asserted by Mr. Atkinson's representatives that he was a contractor, an original promoter who owned all but a few shares of the stock of the Interstate Railway and that he still owns this stock. The federal court term in St. Joseph opens Sept. 20. Judge Van Valkenburgh will probably sit there then; the term in Kansas City opens Sept. 10.

Inquiries at Pittsburgh.—Inquiries have been received by the Foreign Trade Commission of Pittsburgh, Pa., for prices on an order which will aggregate many hundreds of thousands of dollars. The inquiry was from the purchasing department of the French government and includes the following items: 5835 cars and coaches; 1750 journal boxes and 80 tons of drawbars.

No Bids for Newport Franchise.—Not a bid had been received for the street railway franchise in Newport, Ky., at 11 o'clock on Aug. 2, the time set for closing the bidding by the City Commission. The franchise was passed on May 31. Commissioner McCrea opposed the condition that the successful bidder must pay \$1,500 per route mile annually for the use of the streets on the ground that no company could afford such a rental, but he was overruled by the majority. Commissioner Morlidge is reported to have said that the Cincinnati, Newport & Covington Railway, which is now operating local lines, will submit a bid within a few weeks.

Dismissal of Complaint Against Seattle Asked.—Instead of filing an answer to the complaint of the Puget Sound

Traction, Light & Power Company, Seattle, Wash., made recently to the Public Service Commission, alleging that the municipality has entered into a campaign of harassment against the company, Corporation Counsel Bradford of the city of Seattle has filed a motion to dismiss the complaint of the company, on the grounds that the State Public Service Commission has no jurisdiction or power to hear or determine the matters set forth in the complaint. Until this motion has been acted upon the city of Seattle will not file its answer to the charge of the company.

Seattle Valuation Halted.—Councilman Allen Dale of Seattle, Wash., has introduced a resolution providing for a conference between members of the State Public Service Commission and the City Council, with a view to having the city aid the commission in completing a valuation of the Puget Sound Traction, Light & Power Company's properties in Seattle. The work of valuation is about three-fourths completed, according to a statement by Charles C. Reynolds, chairman of the commission, but because of a lack of funds cannot be finished until after the next session of the Legislature. Councilman Dale and other members of the Council believe that it would be to the interests of the city to extend such aid as is necessary in order to hasten the completion of the work.

Company Must Obey Terms of Franchise.—The Supreme Court of Michigan has decided in favor of the city of Monroe in its suit against the Detroit, Monroe & Toledo Short Line Railway, Detroit, Mich., to compel the latter to operate at least one car in both directions every hour. The railway took the position that jurisdiction rested with the State Railroad Commission as to the necessity of operating in accordance with the franchise provisions, but the Court held that inasmuch as the franchise was accepted before the change in the State railroad law, the railway must abide strictly by its terms. The company has been operating in accordance with the franchise in summer, but it has removed one car from the schedule in the winter months because business did not warrant its operation.

Power Contract Renewal.—The Chicago & Joliet Electric Railway, Joliet, Ill., announces the renewal of its contract for power with the Public Service Company of Northern Illinois to cover the period up to 1930. The terms of this contract have been submitted to the Illinois Public Utility Commission, which has informally approved them. Under the old contract the railway received all its energy from the Public Service Company's plant at Joliet, Ill. Under the new contract the local Joliet lines will continue to receive energy from the Joliet plant, but the interurban lines will be supplied from Blue Island, Ill. This change required the installation of a substation at Summit, Ill., a point on this company's interurban line near Chicago. The plant there is equipped with three 1000-kva. transformers.

Results with Surface Contact Systems at Lincoln, England.—The result of last year's working of the G.B. surface-contact system at Lincoln has been the slight increase in running costs per car-mile of from 5.91d. to 6.37d. The cost of repairs to the G.B. equipment, while slightly less than in the previous twelve months, is still considerably in excess of the average guarantee of £90 given by the company, and the actual average cost of repairs to the equipment has now increased to £110 per annum. The tramways manager, however, points out that evidently the £90 guarantee was on the basis that the G.B. system would be applied in many other towns, and that in consequence the cost of repair parts would be considerably less than was now actually the case when they all had to be made specially as required.

Temporary Extension of Manhattan Bridge Contract.—The present contract for the operation of surface cars on the Williamsburg Bridge, New York, will be continued until Nov. 30, by mutual understanding between Bridge Commissioner Kracke and the Bridge Operating Company. The agreement expires on Aug. 31, but to enable all the companies concerned in the controversy over the new contracts to reach some sort of a settlement the time has been extended by the Board of Estimate. Three railroad companies were concerned in the postponement of the expiration date—the Third Avenue Railway, whose offer for operation is the one now favored most by the Bridge Department; the

Manhattan Bridge Three-Cent Line and the Bridge Operating Company, the stock of which is owned jointly by the Brooklyn Rapid Transit Company and the Third Avenue Railway.

Reconsider Strike Award.—Dr. John Price Jackson, commissioner of the Department of Labor and Industry of Pennsylvania, who served as umpire on the board which arbitrated the wage question between the Wilkes-Barre Railway and its employees, has notified officials of the union that he will reconvene the board of arbitration for the purpose of determining whether the board had erred in its award. The arbitrators fixed a sliding scale award, and the union officials say that the agreement gave the board no authority to fix anything but a flat rate. The union leaders contend also that the award was indefinite, and that the fixing of a profit-sharing plan was a mistake. The union leaders point out that the board sent them a communication notifying them of the award, but allege that the award has not been properly drawn up and has never been signed.

Detroit Purchase Agreement Signed by Mr. Couzens.—The proposed purchase agreement between the city of Detroit and the Detroit (Mich.) United Railway by which the city would take over the property of the company within the one-fare zone has been signed by James E. Couzens, president of the Street Railway Commission, who is now in California. It is expected that the agreement will be submitted to the Common Council on Aug. 17, at which time some committee probably will be empowered to report out a date for the special election necessary in connection with the proposition. Inasmuch as the agreement must lie on the table for thirty days it is probable the election will occur late in September or early in October. When the agreement is sent to the Council the Street Railway Commission plans to offer figures setting forth in detail the earnings of the company within the one-fare zone and showing what the city expects to get to meet its obligations after acquisition of the lines.

Bill of Particulars Filed Against New Haven.—The United States Government has filed in the Federal District Court the bill of particulars asked for by the officers and directors and counsel of the New York, New Haven & Hartford Railroad to enable them to answer the Sherman law indictment charging them with engaging in a conspiracy to monopolize interstate trade and commerce between the New England and other States. The government alleges that in each of the matters specified in the 188 paragraphs of the bill of particulars it was with the purpose and intent of aiding, abetting and carrying out the conspiracy that the defendants adopted the plans and became responsible for them. The bill of particulars, after explaining in detail the acquisition of the various railroads, electric railway and steamboat lines, states that it was the purpose of the alleged conspirators in making the combination to control each of the common carriers absorbed and to induce and compel them to engage in the combination.

Joliet Wage Demands to be Arbitrated.—The demand for an increase in the hourly wage of the employees of the Chicago & Joliet Electric Railway Company, Joliet, Ill., was refused, and the question is to be submitted to arbitration. Under the terms of the contract which expires on July 1, 1917, the employees were permitted to open the question of wages July 1, this year. Accordingly they demanded an increase in the present scale, which provides for 23 cents an hour for the first six months, 24 cents an hour the second six months, 26 cents an hour the second year, 27 cents an hour the third year, if they are promoted to the suburban division, and 30 cents an hour when they are advanced to trainmen on the interurban line between Joliet and Chicago. The employees demanded an increase to 25 cents minimum and 30 cents maximum on the city lines, a 34-cent scale on the suburban lines and a 36-cent scale on the interurban line. These demands did not include employees outside of the train service because the court had decided several years before that employees other than trainmen could not be included. There are about 150 employees in the train service. They have selected F. A. Drew, a Joliet attorney, as their representative in the arbitration. The company's representative will be selected within a short time.

Financial and Corporate

CONFIDENCE IS RETURNING

American business of to-day is like the small boy who, after he got through the woods, wondered why he had been scared. A year ago, at the outbreak of the European war, dire predictions of all sorts of certain disaster were made, but now the country is beginning to smile at its apprehension. The pessimistic view that saw only possible weaknesses and took no account of points of strength, gradually gave way to a feeling of optimism as the country at large came into a fuller recognition of its position in world commerce.

Last August the declaration of war overseas seemed to arouse here an immediate feeling of impotence and danger. There was an adverse trade balance of about half a billion dollars; it was deemed certain that our international commerce could be saved only by some desperate expedient like a government merchant marine; an extended raid on our coffers by foreign liquidation of American securities was feared; the cotton crop was doomed, and the price of capital for American use was sure to rise to prohibitive heights. Bugaboos, one and all!

The trade balance in favor of Europe settled itself. By July, 1915, the balance had shifted in favor of the United States to the extent of a net credit of \$1,094,422,792, brought about by the tremendous excess of exports to Europe over imports from Europe. Instead of being a borrowing nation, this country found itself all at once the only country with capital, credit and goods to lend. We did not need any governmentally-owned marine, miraculously created out of credit, for Europe sent ships for the goods she wanted. The cotton crop financed itself with the aid of banks. Moreover, liquidation of European-held American securities on any very large scale failed to materialize, for it seems that Europeans unexpectedly believed that the United States, the only large neutral country endowed with sufficient industrial and financial powers to furnish Europe with the necessary food and goods for war consumption, was the safest place to have money invested. Last July, it is true, the bond market was overshadowed by some foreign selling to provide funds to meet the colossal British war loan, but the investment demand here was sufficiently keen to absorb such sales at comparatively small recessions in price. Nor has the price of American capital risen to prohibitive figures, notwithstanding the unexpectedly large war loans floated abroad. In June of this year New York City placed a large issue of 4½ per cent securities at a lower cost than in 1913, and fixed capital has been no harder to borrow this year than last. Interest rates on commercial paper, call money and time loans were lower in the first half of 1915 than in the corresponding period of 1914.

The foregoing are simply some of the features that mark the recovery of the United States during the last year and the recognition of its financial and economic independence. The position of this country in world commerce has become so powerful that the Bank of England has shipped more than \$50,000,000 of gold and securities to these shores in order to strengthen British financial prestige in New York markets. It should not be understood, however, that the future will be one of unalloyed prosperity. With a long continuance of the war the cost of capital and of living may rise slightly, and the degree of engagement of the country's industrial capacity for foreign consumption and the sharing of profits with workmen may prove an embarrassing over-extension when war is ended, but America is now more experienced in its ability to adapt itself to economic conditions. The greatest encouraging general factor now is the prediction of favorable crops, with increased acreage, quantity and diversification. The National Chamber of Commerce stands sponsor for the statement that confidence in the future is growing apace with the steady progress of the crops and the slow but continual improvement in industrial affairs. Although electric railways have their own peculiar problems of rates, wages and now jitney competition that demand special solution, they and other carriers should be benefited by the present improvement, which it is believed would persist even in the face of our own entanglement in foreign troubles.

ANNUAL REPORT

Montreal Tramways

The statement of income, profit and loss of the Montreal (Que.) Tramways for the year ended June 30, 1915, follows:

Gross earnings	\$6,525,231
Operating expenses	3,713,996
Net earnings	\$2,811,235
Deductions:	
City percentage on earnings.....	\$414,149
Interest on bonds and loans	825,415
Interest on debenture stock	800,000
Taxes	92,800
Total	\$2,132,364
Net income	\$678,871
Dividends	278,880
Surplus	\$399,991
Transferred to contingent renewal account.....	275,000
Transferred to general surplus.....	\$124,991

The gross earnings decreased during the year \$617,572 or 8.65 per cent on account of the war and the financial depression. The operating expenses, however, decreased \$492,118 or 11.70 per cent, so that the net earnings decreased only \$125,454 or 4.27 per cent. The ratio of operating expenses to earnings was 56.92 per cent, compared to 58.89 per cent last year.

The sum of \$212,732 was charged to the contingent renewal account during the year, representing expenditures made for special renewals. An amount of \$666,429 was expended in the maintenance of the company's properties, plant and equipment. This, together with the amount charged to renewal account, made a total expenditure on upkeep of \$879,161. During the year there was expended on capital account the sum of \$621,125. There was also redeemed and cancelled \$144,906 of the underlying bonds of the company. The amount redeemed to date is \$983,513. The total passengers carried during the year numbered 206,992,801.

LINE REORGANIZES TO ELECTRIFY

F. A. Dolph, Chicago, Ill., who purchased the property of the Cincinnati, Bluffton & Chicago Railroad, Huntington, Ind., last October, has announced the reorganization of the company under the name of the Huntington, Bluffton & Portland Railroad. When \$113,000 of the purchase price of \$357,000 is paid on Sept. 6, the deed for the property will be delivered to the new company. The first payment is being advanced by a three-year 6 per cent gold debenture issue limited to \$150,000. When possession of the property is thus secured, the company plans to put out a first mortgage bond issue of \$700,000 to refund the debentures, to pay the second and third installments on the purchase price and to provide for the electrification of the line. The organization will ultimately have \$278,000 of common stock, \$220,000 of preferred stock and \$700,000 of bonds, a total of \$1,200,000. The new company will be capitalized at only 40 per cent of the old.

The railroad is now operated as a steam line, with a present valuation of \$901,964, according to the J. G. White Engineering Corporation. It has 50 miles of main line and 8 miles of branch and spur lines, operating in an ideal interurban territory. The betterments, electrification and equipment are estimated to cost about \$300,000.

As noted in the ELECTRIC RAILWAY JOURNAL of June 19 and July 31, Mr. Dolph has made an offer for the Fort Wayne & Springfield Railway, Decatur, Ind., which was scheduled to be sold on Aug. 12. It is reported that this interurban line would become part of a 420-mile electric railway system reaching into Ohio and northwestern Indiana.

Aberdeen (S. D.) Railway.—The Aberdeen Railway has been sold at receiver's sale to Charles A. Howard for \$21,000. It is reported that the stockholders of the old company will reorganize a new corporation sufficiently financed to operate the system. Already more than 85 per cent of them have joined in subscriptions to the new company, and it is expected that practically all of them will be so interested.

American Railways, Philadelphia, Pa.—The directors of the American Railways on Aug. 10 declared a quarterly dividend of 1 per cent on the common stock, payable on Sept. 15 to stock of record on Aug. 29. This dividend compares with a last previous dividend of 1¼ per cent. In explanation of the reduction the directors issued the following statement: "The falling off in earnings of the subsidiary companies, caused almost entirely by business depression and the rainy summer, and very little by jitney competition, made the board feel that the conservative thing to do was the reduction of the common stock dividend to a basis of 4 per cent per annum."

Ardmore (Okla.) Electric Railway.—David E. Booker has been appointed receiver for the Ardmore Electric Railway to succeed John F. Easley, resigned. The appointment of Mr. Easley was noted in the *ELECTRIC RAILWAY JOURNAL* of Jan. 16.

British Columbia Electric Railway, Ltd., Vancouver, B. C.—The directors of the British Columbia Electric Railway, Ltd., state that, owing to the large decrease in the company's earnings since the first of the year, they are unable to recommend any further dividends on the preferred and the deferred ordinary shares of the company for the fiscal year ended June 30. The net earnings for the last six months of 1914 were \$942,500, a decrease of \$306,000. For the first six months of 1915 the decrease was \$761,500, making the total decrease for the fiscal year approximately \$1,068,000, or 44 per cent. The net earnings for the year ended June 30 were \$1,352,500.

Cincinnati, Dayton & Toledo Traction Company, Hamilton, Ohio.—The Cincinnati, Dayton & Toledo Traction Company recently settled two judgments, for \$5,479 each, obtained in the United States District Court in December, 1914, and representing the principal and interest of debenture bonds of the subsidiary Dayton Traction Company. The company made an arrangement to pay \$3,125 on each claim at once and the remainder on Dec. 24, when a rental instalment will be received from the Ohio Electric Railway. There is no connection between the above mentioned debentures and the \$250,000 of first mortgage 5 per cent gold bonds, due on July 1, 1916, of the Dayton Traction Company.

Cincinnati, Newport & Covington Light & Traction Company, Covington, Ky.—The stockholders of the Cincinnati, Newport & Covington Light & Traction Company have authorized the directors to agree to a plan for the refunding of the bonded indebtedness of the Union Light, Heat & Power Company proposed by the Columbia Gas & Electric Company, which leases the property from the Cincinnati company. Under the plan the present bonded indebtedness, which matures in 1918, will be refunded by a new issue of \$5,000,000 of fifty-year bonds, which will be used to take up the present issue of \$2,000,000 with the remainder held for betterments. The Columbia company will provide a sinking fund for the new bonds.

Cleveland & Ohio Central Electric Railway, Cleveland, Ohio.—The Cleveland, Barberton, Coshocton & Zanesville Railway on July 19 received permission to change its name to the Cleveland & Ohio Central Electric Railway. An amendment also approved at this time, changing the route of the company from that prescribed in its charter, is to go into effect on Aug. 14. The new route is described elsewhere in this issue.

Denver (Col.) Tramway.—The Denver Tramway has notified holders of the first and refunding sinking fund mortgage twenty-five-year 5 per cent gold bonds of the Denver City Tramway, its predecessor company, that it will pay to the Bankers Trust Company, New York, successor trustee, a sum equal to 1 per cent of the principal issue of the bonds and an additional sum equal to the annual interest on all the bonds, amounting in the aggregate to about \$124,000, to be used for the redemption of bonds for the sinking fund. Sealed proposals for the sale of the bonds will be received by the Bankers Trust Company on or before Aug. 24 at not exceeding 105 and accrued interest.

Dominion Power & Transmission Company, Hamilton, Ont.—The talk in financial circles of the purchase of the plant of the Dominion Power & Transmission Company by the Hydro-Electric Power Commission of Ontario was alluded

to on Aug. 4 in a statement by W. C. Hawkins, managing director and secretary of the company. Mr. Hawkins declared that no negotiations were on at the present time. The last deal for the sale of the property, which was with Toronto financiers, fell through. The price mentioned at the time was \$16,000,000. The fact that the company is erecting a steam plant at a cost of about \$2,000,000 is taken as evidence that it has no plans at present for selling out, despite the fact that civic officials here understand that as soon as the Canadian Northern Railway resumes activity in this district it will endeavor to secure the private power plant in opposition to hydro-radials.

Hagerstown & Frederick Railway, Frederick, Md.—The total operating revenues of the Hagerstown & Frederick Railway for the year ended June 30 were \$424,347 as compared to \$404,088 last year, an increase of \$20,258. The operating expenses for 1915 were \$255,373 as compared to \$261,911 last year, a decrease of \$6,538. The operating income for 1915 was \$168,973, an increase of \$26,796. Income from other sources was \$9,662 in 1915 and \$1,566 last year. The gross income this year was \$178,636, as compared to \$143,743 in 1914.

Hudson & Manhattan Railroad, New York, N. Y.—The board of directors of the Hudson & Manhattan Railroad has declared a semi-annual interest payment of 1 per cent or \$10 on each \$1,000 adjustment income bond for the half year ended June 30, 1915, payable on Oct. 1. This payment is at the usual rate.

Interurban Railway & Terminal Company, Cincinnati, Ohio.—The report of Charles S. Thrasher and Charles M. Leslie, receivers of the Interurban Railway & Terminal Company, to the Common Pleas Court for the nine months ended June 30, states that the receipts amounted to \$180,874 and the expenses to \$168,668, leaving a net income of \$12,205, from which had to be deducted taxes of \$9,791. There was a net surplus of \$2,562 for June, but there is a deficit of \$1,086 for the nine months. The car-miles operated during the nine months numbered 752,107.

Minneapolis, Anoka & Cayuna Range Railroad, Minneapolis, Minn.—The Minneapolis, Anoka & Cayuna Range Railroad, the successor of the Minneapolis & Northern Railway, on July 28 filed for the purpose of record a \$2,500,000 mortgage to the American Trust Company and C. H. Bowen, Boston, as trustees. President F. H. Stevens is reported to have said that under the new mortgage \$250,000 is already available and of this amount \$125,000 will be applied to the purchase of the railway property from C. P. Bratnober and others, who came into possession by foreclosure liens for labor and material. The other \$125,000 will be used to complete the connection with the street railway line at Marshall Street, Minneapolis, and the electrification of the service. The company expects now to complete promptly the plans for through passenger service from Anoka to the corner of Marquette Avenue and Sixth Street in Minneapolis. It is expected that electric cars of the type used for the Twin City Rapid Transit Company will be running by Sept. 1. Pending completion of the trolley construction this line is being operated by steam.

Nova Scotia Tramways & Power Company, Halifax, N. S.—The Nova Scotia Tramways & Power Company, which was incorporated in 1914 to take over the Halifax Electric Tramway, Ltd., has asked the Nova Scotia Public Utilities Commission that its capital be increased to \$10,000,000 and that \$5,000,000 of first mortgage thirty-year bonds be issued at 5 per cent, \$3,000,000 to be presently issued, and the balance only to be issued for future requirements under restrictions against 80 per cent of expenditures on capital account. The petition also requests the board to approve \$3,000,000 par value of bonds, 32,500 shares of preferred stock and 62,500 shares of ordinary or common stock, to the order of the Nova Scotia Light & Power Company. The proceeds would be devoted to the following purposes: \$800,000 to the retirement of mortgages outstanding on the Halifax Electric Tramway, Ltd.; \$1,227,780 to construction of works; a certain amount to provide for taking over of the various properties, and the balance for contingencies and working capital. A report by The J. G. White Company showed that within only 55 miles of Halifax on the

property owned by the company there is a lake area that would give a storage of 2,000,000 cu. ft. of water, which would produce about four times the electric power at present available in Halifax. The estimated cost of works necessary for the development of this power was put at \$1,534,000. The report of P. Sothman, formerly chief engineer Hydroelectric Power Commission of Ontario, confirmed this report.

Pacific Gas & Electric Company, San Francisco, Cal.—The California Railroad Commission has authorized the Pacific Gas & Electric Company to acquire the capital stock of the West Sacramento Electric Company, now owned by George F. Detrick and H. W. Furlong. Messrs. Detrick and Furlong have agreed to sell all their interests to the Pacific Gas & Electric Company, which pays \$27,000 to the former and \$3,000 to the latter, they to invest the money in preferred stock of the purchasing company at \$82.50 a share. The Pacific Gas & Electric Company already owns and operates the electric railway lines in the territory served by the purchased company.

Port Jervis (N. Y.) Traction Company.—A Philadelphia syndicate headed by Edward E. Mandeville has formed a merger of the public utility companies, including the Port Jervis Traction Company and the Port Jervis Light & Power Company, in the territory around Port Jervis. The new company will be known as the Orange County Public Service Company.

Richmond & Rappahannock River Railway, Richmond, Va.—The Richmond & Rappahannock River Railway has filed a mortgage to secure \$500,000 of first mortgage bonds, due in 1935. This line operates between Richmond and Pamunkey, 7.5 miles by electricity and 17.9 by steam. It is expected that the line will be extended to Urbana in the near future.

San Joaquin Light & Power Corporation, Bakersfield, Cal.—The California Railroad Commission has issued an order authorizing the San Joaquin Light & Power Corporation to pledge as collateral security \$205,000 of first and refunding mortgage forty-year Series "C" 6 per cent bonds for an issue of promissory notes not exceeding \$153,750. The notes are to be in such ratio that their face value shall not be less than 75 per cent of the face value of the pledged bonds, and are to mature on or before two years and to bear interest of not more than 8 per cent, April 1, 1916, being the limit of issuance.

Toledo, Ann Arbor & Jackson Railroad, Toledo, Ohio.—On Aug. 5 the Ohio Public Utilities Commission authorized this company to sell \$523,000 of 5 per cent bonds at 85 to secure funds to complete its line to Dundee, Mich. The company was authorized in June, 1913, to sell \$850,000 of bonds at 80 for the purpose of extending the road to Ann Arbor, but according to report was never able to sell them.

Underground Electric Railways, Ltd., London, England.—The directors of the Underground Electric Railways, Ltd., have declared a distribution of interest at the rate of 6 per cent per annum (free of income tax) on the non-cumulative income bonds of 1948 for the half year ended June 30, payable on Sept. 1. This is the rate paid for the last three years. Among the controlled companies the Metropolitan District Railway has declared a dividend at the rate of 3 per cent per annum (less income tax) on the second preferred stock for the half year ended June 30, and the London Electric Railway at the rate of 1 per cent per annum (less income tax) on ordinary shares, interim, these payments being the same as those of last year. The London General Omnibus Company has declared a dividend at the rate of 6 per cent (free of income tax) on ordinary shares, interim, as compared to 8 per cent in 1914. The City & South London Railway has declared an interim dividend at the rate of 5 per cent on the outstanding preferred stocks of 1891, 1896, 1901 and 1903, while the Central London Railway has declared an interim payment at the rate of 3 per cent per annum on the ordinary stock and at the rate of 4 per cent per annum on the preferred stock.

United Light & Railways Company, Grand Rapids, Mich.—Under the offer noted in the ELECTRIC RAILWAY JOURNAL of June 12, holders of \$1,617,300 of 3 per cent second preferred stock of the United Light & Railways Company

had up to July 17 converted their holdings into 6 per cent cumulative first preferred stock. The second preferred stock outstanding before the exchange privilege was offered amounted to \$2,108,700. The privilege extends until Aug. 15, when the company may exercise the right to designate whether the stock still outstanding shall be converted into first preferred stock or common stock.

West End Street Railway, Boston, Mass.—F. S. Moseley & Company, Boston, are offering, to yield 4½ per cent, the unsold portion of the two and three-year maturities of the \$4,743,000 of securities recently sold to them by the West End Street Railway, as noted in the ELECTRIC RAILWAY JOURNAL of July 31. These one, two and three-year 5 per cent obligations are known as "serial debenture bonds," dated Aug. 2, 1915, and maturing \$1,581,000 each on Aug. 1, 1916 to 1918, inclusive, without option of prior redemption.

DIVIDENDS DECLARED

Lincoln (Neb.) Traction Company, quarterly, 1½ per cent, preferred.

Massachusetts Consolidated Railways, Greenfield, Mass., quarterly, 1½ per cent, preferred.

Pacific Gas & Electric Company, San Francisco, Cal., quarterly, 1½ per cent, original preferred and first preferred.

Traffic and Transportation

JITNEY JOTTINGS

New York and California Commissions Have jitney Regulatory Problems Before Them—Further Legislative Developments

The Second District Public Service Commission of New York has taken the first steps toward the enforcement of the so-called jitney bus law passed at the last session of the Legislature by applying through its counsel to Supreme Court Justice Hasbrouck at Kingston for a permanent injunction restraining James E. Adams, Corning, and Elmer G. Booth, Rochester, from operating jitney lines without the consent of the local authorities or a certificate of public convenience and necessity from the commission. Justice Hasbrouck will hear the petition on Sept. 4 in Kingston. Other proceedings will also be brought against other alleged violators of the statute. This statute requires all bus lines, motor vehicles, stage routes, any vehicle carrying passengers for 15 cents or less, or any vehicle operating in competition with a common carrier required to procure the consent of the local authorities, to obtain a certificate of public convenience and necessity from the Public Service Commission before operating in the streets of any of the cities of the State. Hitherto the commission has considered the enforcement of this law in the hands of the local authorities and has withheld action on its own part until the local authorities had been afforded time to act. Recently, however, a number of complaints have been lodged with the commission against so-called jitney bus lines apparently operating without authority. At the last session of the commission its counsel was directed to take court action against the alleged violators mentioned. Complaints also have been received against other alleged violators and these will be handled either in the regular way before the commission, or before the courts. The statute in specific terms makes all persons and corporations engaging in the jitney business, as defined, common carriers and subject to all provisions of law as such. The present applications to the Supreme Court are under Section 57 of the public service commission law which authorizes the commission to apply to the court for injunctions to restrain violations of this law.

The United Railroads, San Francisco, Cal., has filed with the Railroad Commission a complaint against the Peninsula Rapid Transit Company, asking that the commission require the Peninsula Company to file with the commission a schedule of rates, fares, charges and classifications, as prescribed by the public utilities act; that the company obtain from the Railroad Commission a certificate of convenience and necessity, as required by that act; and that the company otherwise fully comply with the provisions of the public utilities act. The complaint says that the Peninsula Rapid Transit Company is a California corporation, authorized as a common carrier of passengers for hire, particularly in San Francisco and San Mateo Counties; that the company carries all persons offering for hire from San Francisco through Daly City, Millbrae, Easton, Burlingame to San Mateo and return; that the company operates automobile buses with a capacity of twenty each, on regular schedules, and that for those reasons it is a common carrier and should be under the jurisdiction of the Railroad Commission, but that it has not secured from the city and county of San Francisco, nor from San Mateo County, nor from the governing bodies of the other cities whose streets it uses, authority as a common carrier.

The United Railroads' complaint says that it has franchises and authorization as a common carrier, and has invested many hundreds of thousands of dollars in securing its right-of-way and building and maintaining its suburban railroad line between San Mateo and San Francisco, and was operating this long before the other line began. The complaint says further that the railroad company gives an adequate service at all times between these points, and that there is no necessity for the establishment of the service of the Peninsula Rapid Transit Company.

Action has been brought against the Wichita Transportation Company, a recently established auto-truck service between San Diego, Cal., and the Imperial Valley, by the

Western Association of Short Line Railroads. This association has asked the California Railroad Commission to declare all auto lines running on regular schedules and having fixed passenger and freight rates public utilities and to take jurisdiction in their operation and financing. This is the first time since the start of the jitney craze that concerted action on the part of steam railroads has been taken.

The gross receipts of the Puget Sound Traction, Light & Power Company, Seattle, Wash., have fallen off \$360,000 in the past six months. Since the city gets 2 per cent of this gross a reduction in the city revenues from this source has been at the rate of \$14,200 per year. The decrease is attributed largely to the jitneys. During March between 600 and 700 jitneys were in operation in Seattle. At the height of their prosperity these machines are estimated to have carried 45,700 people a day, cutting heavily into the off-peak load, which affected the company much more seriously than inroads during peak traffic. There are now only about 350 jitneys operating and they cut into the off-peak load very little, as their traffic is chiefly during rush hours. There are now ten to fifteen applications a week for new jitney driver licenses, but cars are deserting the business faster than new ones enter it. The business of the company is now about 14 per cent below normal. The average for the last six months was 19 per cent below normal and it has been at times as far as 25 per cent below normal. As stated previously in the *ELECTRIC RAILWAY JOURNAL* the company is considering a light-weight one or two-man car to compete with the jitneys. The company has put competitive jitneys in Everett and has driven the independent jitneys out of business there to a large extent.

F. T. Griffith, president, and F. I. Fuller, vice-president, of the Portland Railway, Light & Power Company, Portland, Ore., are concerned with the recent complication of the jitney problem resulting from the act of the Supreme Court on July 26 in invalidating the jitney ordinance. The jitneys in Portland are not now required to carry surety bonds and the company is in just about the same position as it was when the jitneys arrived. Both Mr. Fuller and Mr. Griffith look upon the jitneys as more or less of a permanent institution. While they have not yet definitely settled upon a solution to the problem, they are looking toward lighter cars and quicker service.

The jitney regulatory ordinance passed in Scranton, Pa., to go into effect on Sept. 1, provides briefly that automobiles in public service in that city shall secure a license from the director of public safety; that the names of the owners and operators shall be filed with the city, together with facts about the cars, such as name, seating capacity, etc.; that the routes shall be specified; that a bond in the sum of \$2,500 shall be filed for each vehicle having a seating capacity of not more than five passengers, including the driver, with \$500 additional for each permanent seat in excess of the seating capacity of five; that any person owning more than one car shall be permitted to substitute a general bond covering all of his cars, such bond to be in the sum of \$25,000 for not more than ten vehicles, for \$50,000 for not more than twenty-five vehicles and for \$100,000 for more than twenty-five vehicles. The license fee for each vehicle seating five people or less is placed at \$10, for each vehicle seating six or seven people \$15 and for each vehicle seating more than seven people \$25. The carrying capacity of vehicles is fixed at the seating capacity and it is made unlawful to charge more for transportation along and over the route designated than the amount set forth in the license.

After eliminating the provisions calling for the payment of license fees, the Board of Works of Newark, N. J., on Aug. 5 passed the jitney ordinance on first reading. The sections relating to fees were taken out on the advice of City Counsel Frazer. The finance committee of the Common Council had agreed at a recent conference with a Board of Works committee to the fees that should be paid, placing them at \$50 for a car carrying five passengers or less and ranging as high as \$125 for cars carrying more than twenty passengers. The jitney owners and operators will be heard in opposition to the measure on Aug. 17.

The "owl" and "anywhere" jitneys operating in San Francisco have been excluded from the jitney bus class

by order of the San Francisco Police Commission. Hereafter jitney drivers must keep to specified routes and limit charges to 5 cents and 10 cents. Otherwise they come under the livery class, must have stands and load at certain points, with charges regulated by ordinance.

The local branch of the street railway employees' union at Portsmouth, Ohio, asked the City Council on Aug. 5 to pass an ordinance regulating jitney buses and jitney-bus traffic in that city. The men ask that the ordinance contain provisions for a license fee of \$80 annually, fixed routes and terminals, the number of passengers to be carried to be limited to the rated seating capacity of the vehicles, the deposit of \$5,000 by each owner as a protection for passengers who may be injured, and such other measures as govern the operation of utilities.

The City Council of Temple, Tex., has formally adopted the jitney ordinance which it has had under consideration for the past two months. The ordinance becomes effective immediately after publication. The new law follows that of Fort Worth rather closely.

Judge Brumm at Pottsville, Pa., has refused the application of the jitney owners of Pottsville for a permanent injunction against Pottsville city officials, preventing the enforcement of an ordinance regulating the jitneys, but said that he would permit the temporary injunction against the city to stand until September, to give the jitney owners and city officials a chance to agree on a compromise.

Alderman Dodd of the City Council of New Westminster, B. C., has introduced a jitney regulation by-law containing the following provisions: Before a license is issued, the inspector shall satisfy himself that the auto to be used is in good order; driver must be twenty-one years of age, speak English, be physically and mentally fit to operate a car, and skilled therein, and not be addicted to the use of intoxicants or drugs; passengers must not be carried in excess of the seating capacity of the machine; passengers must not be permitted to board or alight from a car, nor may the driver collect fares or give change, while the car is in motion; Council may from time to time designate routes, say where cars will be allowed to stand; drivers must not solicit passengers on business streets; no Asiatic or negro may be allowed to enter a car in which there are already white passengers; every jitney must put up a bond, the amount of which has not been determined.

Enforcement of the jitney bus ordinance in Flint, Mich., in which city the Detroit United Railway operates a city service, has been held up by the Circuit Court issuing an order for the city to show cause why a permanent injunction should not be made restraining the municipality from enforcing the provisions of the ordinance.

George K. Weeks, president of the San Francisco-Oakland Terminal Railways, was quoted recently as follows in regard to the jitney decrease in Oakland: "At the end of last week (July 16) there were 177 jitneys of all sorts plying in Oakland and the transbay cities, in comparison with more than 300 when the craze was at its height. The fact that the Superior Court has refused the injunction demanded by the jitney bus owners, and that consequently the ordinance is to be strictly enforced, should result in diminishing the number very materially. At the same time it must be remembered that so long as jitneys were untaxed and unlicensed they operated in an irregular way, chiefly during the hours of the greatest pressure of travel. The licensed cars, on the other hand, ply on a more or less regular schedule. I am convinced from a close study of the problem that if the gasoline car is to become a permanent factor in the transportation business, its proper field of usefulness will be the interurban run and not in congested city streets. Were the jitneys taxed, as are the street cars, and made to comply with paving requirements, they would not last twenty-four hours. They exist only by virtue of legislative discrimination."

An ordinance before the Council at Akron, Ohio, prescribes severe conditions for the jitney bus operators and taxicabs. Jitney bus drivers must be men of good character, must not smoke while carrying passengers, and must not carry more than the rated seating capacity of their machines. They must specify the routes they wish to traverse, and must cover them each trip. The license fee has not been determined. The fare charged by taxicabs is limited to 25 cents a mile by the ordinance.

TRANSFER ORDER IN ALBANY

On the complaint of the Civic League of Albany against the United Traction Company and the Schenectady Railway, the Public Service Commission for the Second District of New York has made an order directing that when local passengers are accepted on the west-bound cars of the Schenectady Railway a transfer must be issued on request for any of the intersecting lines of the United Traction Company between State Street and Broadway and Watervliet Avenue inclusive, such transfers to be issued in all respects in accordance with the rules of the United Traction Company. The traction company is directed to accept these transfers.

One of the clauses of the commission's order in the general case against the United Traction Company, made on Dec. 11, 1914, provided that the Schenectady Railway must give transfers to passengers boarding its east-bound cars within the city limits, and that order is now being complied with. The present order rounds out the transfer situation between the two companies so far as it relates to local traffic. The latest order of the commission says:

"It is not the regular practice of the Schenectady Railway to pick up west-bound local passengers destined to points east of Watervliet Avenue, but only passengers bound beyond the limits of the city of Albany. However, it does carry such passengers from time to time, but they do not receive a transfer to the lines of the traction company. If it was the regular practice to carry such passengers it would, of course, be very detrimental to the through service. * * * The commission is of the opinion that if the Schenectady Railway voluntarily carries west-bound local passengers it should give to any such passenger who may request the same a transfer good on the connecting lines of the traction company. * * *"

SAFETY-FIRST SINS OF OMISSION BY EMPLOYEES

An interesting safety-first suggestion comes from A. D. Garriott, foreman of a carhouse of the Louisville (Ky.) Railway Company. Mr. Garriott says:

"If the principle of safety was as readily followed as is the sometimes careless indifference to our rules and regulations, we would all soon be perfect and avoidable accidents would be a thing of the past. But it is much easier for us to see the carelessness of the public or of some one else than it is to hold ourselves from violating some of the principles of safety and of the company's rules. How often we see men who advocate safety first and make suggestions along this line, and men who are really interested in the safety movement, do things on a sudden impulse of the moment that are a bad example to anyone who may see them. We see a car approach a carhouse or some place that is not a regular stop, the motorman catching the front of the car while it is in motion. We see employees run after cars or climb over the rear dash or ride the coupling to the next stop. Again we see motormen stand on the lifeguard and reach through the front vestibule and move the car. We see carhouse employees stand in passageways where cars might split switches and cause serious accidents. We could also show where track men and men in all departments of the company violate the principle of safety. Now we cannot say that these things are done deliberately, or simply because we do not think, or to save a few steps or a little time. I think if every man would make a resolution to set an example of safety, much good could be accomplished. Don't look for some defect in equipment or something some one else should have done, but ask yourself the question: 'What am I doing to prevent accidents and am I practising safety first?'"

REFUSAL TO EXTEND FARE LIMIT

The Connecticut Company, New Haven, Conn., has refused the request of residents of Prospect Beach who requested the company to extend the fare limit on its line out of New Haven from Cox's to Sea Bluff. In its reply the company said in part:

"In regard to the fare limit, we are obliged to advise you that we cannot under present conditions extend this beyond its present location at Cox's. This seems to us

the logical place for the fare limit, and when the length of ride for 5 cents is considered from Church and Chapel Streets, New Haven, to Cox's, a distance of 4.82 miles, with transfer privileges of anywhere from 2 to 9 miles further, Lighthouse Point, a distance of 9.60 miles; Short Beach road, 9.90 miles; Dixwell Avenue terminus, 9.15 miles; Barnes and Quinpiac Avenue, 0.20 mile; you certainly must agree with us that our rate is more than reasonable.

"As you are well aware, the last decade has seen a tremendous increase in the cost of material of every description, labor charges are much higher, in fact, every item entering into the operation of street railways has made this business more expensive. On the other hand, our fares have remained the same, and while the purchasing power of the nickel to us has vastly decreased, we are, in many cases, giving a very much longer ride for the same money.

"In addition to the increase in operating expenses, the street railways at the present time are laboring under extremely heavy burdens imposed by State and municipal governments, expensive permanent pavements, oiling and sprinkling of streets, maintenance of highway bridges; these charges, combined with the recent unrestricted competition of the jitney which is extremely serious, inasmuch as it is taking from us our profitable short-haul passengers, all tend to make street railway returns less profitable each year."

Licenses Trolley Cars.—At the meeting of the Commissioners of Hoboken, N. J., on Aug. 4, an ordinance was adopted under which every car of the Public Service Railway, Newark, entering Hoboken must have a license, for which it must pay \$25.

Cash and Transfer Registers in Springfield.—The new system for the use of cash and transfer registers on all cars on the Springfield (Mass.) Street Railway went into effect on Aug. 1. Under the new system a minute report of the various details of operation is required. Passes are no longer issued to employees or others, but tickets have been issued to replace them. This facilitates the accounting. Each car is equipped with two registers. The one is used to record cash fares, while the other records transfers and tickets received.

Westchester's Punctuality Record Better Than Ever.—In connection with the details of the New York, Westchester & Boston Railway's remarkable punctuality record for the last twelve months ending June 30, 1915, which were published in the *ELECTRIC RAILWAY JOURNAL* of July 31, additional figures now available for the month of July show that this railway's average for promptness is still on the increase in spite of the narrow margin possible for improvement. Out of 6536 trains run during July 6505 trains, or 99.5 per cent, were on time, as compared with this company's average for the last twelve months of 99.2 per cent.

Enforcing the "Jim Crow" Law.—The State law requiring the separation of whites and blacks in railway trains is being strictly enforced by the Louisville & Interurban Railway, Louisville, Ky. Since cards have been posted stating the terms of the State law there has been little difficulty in obtaining compliance with the measure, although this is sometimes grudgingly given. The compartment in each car reserved for the negro traffic is not as commodious as that for the whites, although it is not as frequently filled. On Sundays, however, there are sometimes more colored passengers than can be accommodated in their compartment regularly and easily and delays while they pass along the aisles are unavoidable.

Express Service Between Springfield, Worcester and Providence.—The electric express service of the Springfield (Mass.) Street Railway was extended on Aug. 2, when special service between Springfield and Providence by way of Worcester was begun. The decision of the officials to run a special car making the through trip in twenty-two hours was made in response to a demand which has been most pronounced from Providence shippers. Starting from Springfield over the lines of the Springfield Street Railway, the new express car travels over the tracks of five

separate railway systems. From Worcester to Uxbridge the route is over the lines of the Worcester Consolidated Street Railway. From Uxbridge to Milford the route is over the Milford & Uxbridge Street Railway, and from Milford to North Attleboro via the Milford, Attleboro & Woonsocket Street Railway. From North Attleboro to Providence the trip is over the Interstate Consolidated Street Railway and the lines of the Rhode Island Company.

St. Louis Skip-Stops Allowed.—The Missouri Public Service Commission has made an order authorizing the United Railways, St. Louis, to abolish 102 stops for three months. Sixty-two of the stops to be eliminated in the test are on the Broadway line. The remainder are on the Olive-University, Olive-Delmar and Olive-Maryland lines. The opinion holds that the United Railways in asking that 770 stops on various lines be eliminated did not submit sufficient proof that the changes sought would not inconvenience the public or result in greater safety to passengers and pedestrians. The experiment eliminating the 102 stops will begin on Sept. 1. The order states that if at the expiration of the test period it is determined that better service can be rendered to the majority of passengers on those lines, the United Railways will be permitted to petition the proper municipal authorities of St. Louis for the necessary modification of regulations to eliminate all useless stops.

P. R. T. to Carry Postmen for \$24,000 a Year.—The Philadelphia (Pa.) Rapid Transit Company and the United States government have entered into a new contract dating from July 1, 1915, and extending to June 30, 1916, under which letter carriers will be carried at an annual rate of \$24,000, an increase of \$10,000 over the contract executed five years ago by the government with the company at a rate of \$14,000 a year. When the agreement expired on July 1, the company refused to renew it on the ground that the rate was too low. An investigation by the company is said to have shown that it would collect \$95,000 a year in fares from carriers at a 5-cent cash charge. In declining to renew the agreement the company is said to have suggested \$71,000 per annum as compensation under a new contract. The postal officials demurred and it was finally agreed to grant an extension of the old agreement for one month, or until Aug. 1, to allow a further investigation in an effort to reach an adjustment of the dispute which would be acceptable to both sides.

Favorable Brooklyn Accident Record.—On the subject of safety the Brooklyn (N. Y.) Rapid Transit Company's activities have been numerous and far-reaching. According to the annual report of the company the various departmental organizations were completed during the autumn of 1914. In each of the last six months boarding and alighting accidents, car collisions, accidents in which cars strike persons, and car and vehicle collisions, make a more favorable showing than in any one of the corresponding months of the previous year—and this in spite of the fact that the hazard of accident was increased substantially by the reconstruction of several of the elevated lines and the construction of new lines, with operation over the same routes proceeding uninterruptedly during the progress of the work. While there were 1333 fewer accidents on the system during the fiscal year than during the preceding year, the payment for damages showed an increase owing to the fact that the number of actions tried representing accidents of previous years shows an increase of 42 per cent.

Excursions by Trolley and Boat to Niagara.—The Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has adopted a joint passenger tariff in connection with the Ohio Electric Railway, the Detroit & Cleveland Navigation Company, the Cleveland & Buffalo Transit Company and the International Railway, Buffalo, naming excursion rates from various points on the Fort Wayne & Northern Indiana Traction Company's line to Niagara Falls, N. Y., and return. The Union Traction Company of Indiana is also concurring in the excursion, routing people from Indianapolis and points on its line in connection with the Fort Wayne & Northern Indiana Traction Company to Fort Wayne and turning them over to the Ohio Electric Railway. The full excursion fare to Niagara Falls from La Fayette, the most

westerly point on the line of the Fort Wayne & Northern Indiana Traction Company's line, is \$10. This, of course, does not include meals, berths or staterooms. The route from La Fayette is via Logansport, Peru, Fort Wayne and Lima to Toledo, and thence by boat across Lake Erie.

Causes of Delays Advertised in Kansas City.—The receivers of the Metropolitan Street Railway, Kansas City, Mo., recently advertised in the daily papers of that city in a space 11 in. square a record of delays in service. The statement introducing the tabulation of interruptions to service follows: "Reports of every delay in the street railway service are made to the headquarters at Grand Avenue and Fifteenth Street. Whenever a delay occurs the nearest division station is immediately notified and either a repair motor truck or car is at once ordered to the scene. Many of these delays are due to causes over which the company has no control. Last week two were due to parades, one tying up most of the downtown service from ten to forty minutes. Fires, wagons or automobiles breaking down on car tracks and freight train blockades are other instances. Where possible cars are routed around blockaded sections. In all cases the street railway company uses every means to overcome obstructions to regularity in service. A record of delays in service for five days of last week is given here in the belief that it will be of interest to the patrons of the company."

Order Regarding Substitution of Open Cars for Closed Cars.—Under date of April 15, 1913, the Public Service Commission of the District of Columbia notified the Washington Railway & Electric Company that open cars could be substituted for closed cars on the basis of five open cars to furnish the service supplied by eight closed cars. Subsequently it passed an order prohibiting passengers from standing on the running boards. This resulted in passengers standing between seats on open cars. In a letter to the company on Aug. 6 the commission states: "The commission recognizes the objection to the practice of passengers standing between the seats and therefore believes that this space should not be taken into account in calculating the capacity of cars. While open cars have much greater seating capacity than the closed cars, these restrictions reduce the standing room in open cars to such an extent that the capacity of the two types of cars, including standing passengers, is nearly the same. It, therefore, appears to the commission that the capacities of open cars and closed cars do not warrant the substitution of only five open cars for eight closed cars, and that they should be considered on the same basis, and when open cars are operated the same number of open cars should be placed in service as is called for by the schedule in effect during the period of closed-car operation."

Fourth Report of New Jersey Welfare Committee.—The fourth annual report of the welfare committee of the Public Service Corporation of New Jersey has just been issued. As its name implies, the committee administers the welfare work of the corporation and its subsidiary gas, electric and railway companies, which work covers sick benefits, pensions and life insurance. In addition the committee looks after the payments made necessary by the employers' liability and workmen's compensation act. The corporation's voluntary welfare work and the operation of the State law are made somewhat reciprocal in that the employee receives the benefit of the one which redounds to his greater advantage. For instance, if the company's own plan called for a larger payment than the liability law in any specific case, the company would not stand on the strict letter of the law, but would make the larger payment. During the four years that the plan has been in effect the company has disbursed to employees, their relatives or dependants \$370,990. Of this amount \$144,697 was compulsory under the State law, the balance, or \$226,292, having been voluntarily paid for pensions, sick benefits and life insurance under the corporation's own plan. For the last year the corporation paid \$68,744 under the head of welfare work and \$53,301 required by the compensation act, a total of \$122,045. This was an increase over the preceding year of \$12,319 in voluntary payments and of \$5,443 in compensation required by the State law. The corporation has close to 15,000 permanent employees.

Personal Mention

Mr. Clinton D. Kellogg, Chicago, has been appointed general superintendent of the Gary, Hobart & Eastern Traction Company, with headquarters in Hobart, Ind. He succeeds Mr. B. J. Schramm resigned.

Mr. W. H. Given has resigned as assistant general manager of the Waterloo, Cedar Falls & Northern Railway, Waterloo, Ia., to become manager of the Arkansas Valley Interurban Railway, a new position with that company.

Mr. R. W. Emerson, superintendent of the New York & North Shore Traction Company, Flushing, N. Y., has resigned effective on Aug. 20, to become assistant superintendent of the Cleveland (Ohio) Railway, a newly created position with that company.

Mr. J. C. Blackburn has accepted a position as superintendent of the street car lines in Marshalltown, Iowa, effective Aug. 1. Mr. Blackburn has been associated with the lines in Galesburg, Ill., since horse cars were used. He was also in service in Cedar Rapids, Iowa.

Mr. Milo R. Maltbie, formerly a member of the Public Service Commission for the First District of New York, and recently chairman of the valuation committee of the National Association of Railway Commissioners, has been appointed a member of the advisory board to Mr. C. A. Prouty, director of the valuation division of the Interstate Commerce Commission, Washington, D. C.

Mr. William H. Hitchcock, formerly general manager of the Trenton & Mercer County Traction Corporation, Trenton, N. J., has been appointed general superintendent of the Jersey Central Traction Company, Keyport, N. J., to succeed Mr. Samuel Barnes. Mr. Hitchcock began his career as a conductor in Washington, D. C., in 1896, and served the Washington Railway & Electric Company in several capacities until 1910, when he was appointed superintendent of transportation of the Wilmington & Philadelphia Traction Company and the Southern Pennsylvania Traction Company, Wilmington. In January, 1913, he was appointed general superintendent of the Trenton & Mercer County Traction Corporation, and subsequently was made manager.

Mr. Cecil G. Rice has been appointed assistant to the president, Mr. James D. Callery, of the Pittsburgh (Pa.) Railways, the Duquesne Light Company and the Beaver Valley Traction Company. The position of superintendent of the claim department, formerly held by Mr. Rice, has been abolished, and the work handled by that department will be divided among five associated bureaus with Mr. R. B. Gribble, chief of clerical bureau; Mr. C. C. Mullen, chief of inspection bureau; Dr. W. M. Holtz, chief of medical bureau; Mr. Augustus Baker, chief of adjustment bureau; Mr. H. B. Ockington, principal adjuster; Mr. G. E. Clarkson, chief of litigation bureau, and Mr. F. A. McKenry, auditor of associated bureaus. Mr. Rice will direct the work of these bureaus in addition to looking after such other matters as may be assigned to him by the president. Mr. Rice was born in Harrisville, W. Va., on Nov. 15, 1878. He attended the State Normal School at Fairmont, W. Va., and the University of West Virginia. Upon the completion of his studies he read law and later took up newspaper work. Before engaging in such work in Pittsburgh, he was city editor of the Parkersburg *Daily News*. Although not a resident of Pittsburgh he was selected by the Mayor, George W. Guthrie, now ambassador to Japan, for special work, and in this capacity served the city for two and one-half years. In January, 1907, Mr. Rice was appointed private secretary to Mr. Callery, president Pittsburgh Railways, later being made general agent of that company and still later being employed in different capacities in the operating department at the shops and carhouses. In August, 1908, he temporarily left the traction field to become credit manager of the Colonial Trust Company and also represented that institution as a member of the Pittsburgh Stock Exchange. In July, 1909, he assumed direction of the claim department of the Pittsburgh Railways, the Duquesne Light Company and the Beaver Valley Traction Company. In addition to introducing advanced ideas in connection with the handling of claims, Mr. Rice has for years been a close student of scientific management and business psychology.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

FRANCHISES

San Jose, Cal.—The San Jose Railroad has applied to the Board of Supervisors of the County of Santa Clara for a franchise to construct, maintain and operate a single or double track standard gage electric railroad with the necessary sidings, turnouts, switches, poles, etc., over a specified route in the county.

Macon, Ga.—The Macon Railway & Light Company is authorized to lay double track on Broadway between Boundary and Giles Streets.

Berwyn, Ill.—A petition has been received by the City Council of Berwyn, Ill., from E. G. Wright and others stating that they are ready to build a street railway upon Harlem Avenue from Thirty-ninth Street north to Twelfth Street, to be operated at a 5-cent fare with transfers from all crosstown lines, provided they are guaranteed a twenty-year franchise.

United Railways & Electric Company, Baltimore, Md.—This company will extend its Columbia Avenue double-track line 2100 ft. from the present terminus at Gwynn's Falls to Lansdowne.

Fairhaven, Mass.—The Selectmen have voted unanimously to grant a franchise to the Massachusetts Highway Service Company, Boston, to install wires on poles of the New Bedford Gas & Edison Light Company and the New England Telephone Company, along the Sconticut Neck Road from Washington Street to the Daniel W. Dean farm, a distance of 2½ miles, and to operate trackless trolley buses over that route. The company has arranged to purchase its power for the operation of its Sconticut Neck line from the Union Street Railway.

Pottsville, Pa.—Pottsville City Council has granted a franchise to build an electric railway to St. Clair, a distance of 3 miles. The Pottsville & St. Clair Electric Railroad is the name of the new corporation.

Petersburg, Va.—The Wythe Street franchise for an electric railway from Petersburg to City Point, for which a bid of \$25 was made by the Petersburg & Appomattox Company, has been awarded to R. H. Mann and S. W. Zimmer of Petersburg, who have taken over the interests of the Appomattox company.

Petersburg, Va.—The City Council awarded to the Petersburg & James River Corporation the Bollingbrook Street franchise for the proposed electric railway from City Point to Petersburg.

TRACK AND ROADWAY

Fresno (Cal.) Interurban Railway.—Construction work on the extension of the Fresno Interurban Railway has been started at the Barton Vineyard. It is possible that 3½ miles of the line may be finished before it is announced whether the road will go to Clovis or Centerville.

Municipal Railways, San Francisco, Cal.—The city of San Francisco has been requested by the United States Army authorities to extend its Union Street line through the army reservation to Fort Scott. The government is preparing plans for extensive new officers' quarters at the Presidio, to cost about \$400,000, and the new line would care for the additional traffic expected by the erection and occupancy of the proposed army buildings. City Engineer M. M. Shaughnessy and T. W. Ransome, chief engineer of the railway company, are investigating the feasibility of the extension. Work on the Church Street extension of the Municipal Railway in Market Street and the proposed Twin Peaks Tunnel line of the same company is being held up, it is claimed, on account of delay by the Board of Supervisors in declaring a policy toward questions of franchise requirements as they affect competing lines. The charter provides that when a new street railway franchise is granted the company obtaining the franchise may use existing lines of a competing company for ten blocks on any street, provid-

ing proper maintenance provisions are made. Otherwise such tracks may be used for a distance of only five blocks under the same conditions. The city is ready to begin laying tracks in lower Market Street, it is asserted, and Mr. Shaughnessy has asked the board for an early declaration of policy on the matters in question so that the work may proceed.

San Francisco-Oakland Terminal Railways, San Francisco, Cal.—Assurances were received from the San Francisco-Oakland Terminal Railways at a recent conference between officials of the company and the city of Berkeley that work would begin within a comparatively short time on the improvement of the company's roadbed on Adeline Street from Woolsey to the Oakland line, to be followed by rebuilding of the company's line on Bramcroft way from College to Telegraph Avenue. The work contemplated will cost about \$28,000.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—Employees of the Wilmington & Philadelphia Traction Company have begun the work of connecting its lines with the People's Railway, which was recently purchased. Several miles of track will be taken up and the running direction of other lines will be changed.

Jacksonville (Fla.) Traction Company.—The committee recently appointed to prepare a statement showing the advantage to the company should it extend its tracks from Ortega to the State camp grounds, has completed its labors, and has submitted to Hardy Croom, manager for the company, a report which tells in detail of the immense amount of development work accomplished and still going on at the grounds, as well as a sketch of its history, its prospects for the future, and a statement of the probable earnings of the proposed extension.

Evanston (Ill.) Railway.—This company has promised service to a now unoccupied tract of desirable building lots if the city will annex the tract and provide it with sewers and water. The company has begun operation on its Howard Street extension.

Chicago & Milwaukee Electric Railway, Highwood, Ill.—This company has been asked to consider the possibility of a west side loop for Evanston, Ill.

Chicago, Peoria & Quincy Traction Company, Peoria, Ill.—A statement in regard to the plans of this company was made by Judge Albert Akers, Quincy, following a meeting of the directors on July 24. Judge Akers is quoted as stating: "A large banking house has come forward with an offer to take sufficient bonds from us to provide funds not only for the building of the first section of the interurban line but the entire line. Coincident with this offer has come the Talbott Construction Company's written proposition, which the board of directors has accepted, making it practically a contract, stating that the construction company regards this bond issue as cash and that the company will undertake the building of the entire line from Peoria to Quincy." [July 12, '15.]

Lafayette & Northwestern Traction Company, Lafayette, Ind.—A hearing was held on July 24 before Commissioners McClure and Edwards of the Indiana Public Service Commission to inquire into the matter of the Lafayette & Northwestern Traction Company, which recently announced that it contemplated the construction of a road from Lafayette to Chicago, and which, it was stated, had undertaken to issue securities without the permission of the Public Service Commission. O. L. Brown, general manager of the proposed line, stated that the Tippecanoe Construction Company had been organized among local farmers to finance the preliminary steps in building from Lafayette to Rensselaer; that about \$10,000 in stock had been sold, and that about \$6,000 in notes had been issued. Subsidies had also been voted by some of the townships through which the proposed road was to pass.

Topeka (Kan.) Railway.—The contract for a concrete bridge over Shunganunga Creek, Kansas Avenue and Twentieth Street, has been let to Arthur E. Allen, Topeka, at \$15,468, of which the Topeka Railway will pay \$4,500. The street railway will extend its line on Kansas Avenue to Twenty-first Street and over the bridge as soon as the structure is finished.

Detroit (Mich.) United Railway.—This company's 1915 program contemplates 14 miles of city track reconstruction in Detroit and a new crosstown line, including $\frac{3}{4}$ mile of double track and 1 mile of single track in Flint, Mich. In addition the company will double track 7500 ft. of the Michigan Avenue line in Detroit and extend the Kercheval Avenue line 4500 ft. Interurban line extensions for this year include $7\frac{1}{2}$ miles from Almont to Imlay City, Mich. This will form a part of the new Detroit, Almont & Northern Railroad, and it will be opened for service about Aug. 20.

Electric Short Line Railway, Minneapolis, Minn.—Plans are being contemplated by this company to construct a 45-mile extension of its lines. Two plans are under consideration. One is for an extension from Winsted to Clara City, via Hutchinson. The other plan is to build south.

***Faribault, Minn.**—W. K. Palmer, Kansas City, is contemplating the construction of an electric railway from Faribault to Waseca and possibly to Blue Earth, Minn.

Twin City Rapid Transit Company, Minneapolis, Minn.—As soon as the company receives permission from the War Department for the use of a right-of-way over a short strip of government property, the work on the extension direct to the Snelling Speedway will begin. A double track line will be laid to within a few feet of the St. Paul side of the racetrack, with a tunnel leading to the track for the ingress and egress of passengers.

Fallon (Nev.) Electric Railroad.—This company, which has completed the grade for its line between Fallon and Sand Springs, is reported to have arranged to proceed at once with construction work.

United Traction Company, Albany, N. Y.—General Managers Carl H. Graf of the Municipal Gas Company and Charles F. Hewitt of the United Traction Company have agreed to recommend to their respective boards of directors the placing underground of electric wires in South Pearl Street from Madison Avenue to Fourth Avenue.

Buffalo (N. Y.) Southern Railway.—This company will extend its tracks through Buffalo Street, Long Avenue, and Pierce Avenue, Hamburg.

Hornell (N. Y.) Traction Company.—The directors of Hornell Traction Company have decided to double track the lines of the company through Main Street and part of Broad Street.

New York, N. Y.—P. Clingman, 33 Pine Street, New York, N. Y., and certain property holders are interested in a plan to build a single-track electric railway along public highways between the towns of Sea Cliff, Glen Cove, Oyster Bay and Roslyn, to connect there with the New York & North Shore Traction Company's line. Three routes have been suggested and preliminary surveys have been made. No incorporation has yet been made and the proposition is still in its preliminary stages. Storage-battery cars may possibly be operated.

Schenectady (N. Y.) Railway.—The Public Service Commission for the Second District has authorized the extension of this company's lines from their present terminus at Nott Street and Wendell Avenue, Schenectady, along Nott Street to the Grand Boulevard at East Alley and thence along the Grand Boulevard on private right-of-way in the town of Niskayuna to Van Antwerp Road. The franchise for the extension was approved by the Common Council, Mayor and Board of Estimate last January.

Northern Ohio Traction & Light Company, Akron, Ohio.—A special committee of the Council of Canton will confer with the officers of the new industries now being located in the northeast manufacturing district and will then take up with the traction company the question of the best route to be followed by the railway extension which is to be built into the district now being so rapidly developed.

Cleveland (Ohio) Railway.—Director of Public Service Sidlo of Cleveland, Ohio, after making an investigation, will recommend to the City Council that the proposed extension of the East Seventy-ninth Street crosstown line of this company to Broadway and Aetna Road be built on two parallel streets instead of having a double track on one street. At a meeting of business men, city officials and county officials at the Chamber of Commerce on Aug. 5,

the proposed subways to the new high-level bridge across the Cuyahoga River were discussed. If such a plan is carried out, one of them will extend from the Public Square through Superior Avenue to the river for the eastern approach. On the west side of the river two lines would be necessary, one on Detroit Avenue to West Twenty-ninth Street and the other on West Twenty-fifth Street to Franklin Avenue. These tubes would be for the use of street cars only. County Engineer Stinchcomb estimated the cost of the subways at \$2,200,000.

Butler & Grove City Railway, Grove City, Pa.—This company has contracted and bought nearly all the material for the equipment of its line. Eleven carloads of rails have been received and these are now being laid. Two cars and material for three bridges remain to be purchased.

Chattanooga (Tenn.) Traction Company.—The extension of this company's lines to Hixon, north of the city, is being considered. It is suggested that later the extension might go on to Dayton, in the north end of the county.

Dallas (Tex.) Consolidated Electric Street Railway.—This company is relaying with new rails the portion of its Oak Lawn line along Bowen Street, between McKinney Avenue and Cedar Springs Road, and is welding the joints with thermit.

El Paso (Tex.) Electric Railway.—Plans are being made by this company to construct a line on Piedras Street from Tularosa Street to Alameda Avenue, El Paso.

Ogden, Logan & Idaho Railway, Ogden, Utah.—This company plans to purchase the right-of-way surveyed last fall for a new interurban line from Ogden to Brigham City. As soon as possible after the right-of-way is secured, construction work will be started. Although the right-of-way was secured and a new line is to be constructed, the present line from Williard to Brigham City will continue to be operated by the company, making two interurban routes to Brigham City. The new line will parallel the Oregon Short Line, with the exception that it will run through the center of Parry and Williard. Operation has been begun on this company's extension to Huntsville.

Petersburg & James River Corporation, Petersburg, Va.—The Petersburg & James River Corporation has begun the construction of an electric railway between Petersburg and Hopewell. Three miles of the road have been graded. J. Walter Long, president of the corporation, says the road will be completed and open for traffic by Dec. 1.

Richmond & Rappahannock River Railway, Richmond, Va.—This company is said to contemplate extending its line to Urbana in the near future.

Tacoma Railway & Power Company, Tacoma, Wash.—It is reported the City Commissioners have received the assurance of Louis Bean, manager of the company, that the Pacific Avenue line will be extended as a concession for a franchise to cross South Tacoma cars over the new Tacoma Avenue fill.

SHOPS AND BUILDINGS

Municipal Railways, San Francisco, Cal.—The contract for constructing the second story of the Municipal Railway carhouse at Geary Street and Presidio Avenue has been awarded by the Board of Works to James L. McLaughlin for \$26,747.

Union Traction Company of Indiana, Indianapolis, Ind.—This company expects to remodel its station at Pendleton.

Albuquerque (N. M.) Traction Company.—George Roslington, receiver of this company, has been authorized by the court to replace the carhouse of the company destroyed by fire recently.

Philadelphia & Western Railway, Upper Darby, Pa.—This company is working on plans for a proposed overhead station on Swede Street, Norristown. When these plans are finished the Council will be asked to permit the company to cover over two and a half squares of Swede Street in an effort to overcome the congestion complained of by the Town Council in making a station of the public street at the courthouse at Swede and Penn Streets, where both the Philadelphia & Western Railway and the Lehigh Valley Transit Company have been loading and unloading passengers.

Manufactures and Supplies

ROLLING STOCK

Worcester Consolidated Street Railway, Worcester, Mass., expects to purchase twenty-four four-motor equipments.

Indiana Railways & Light Company, Kokomo, Ind., has ordered two very light cars from the Cincinnati Car Company.

Butler & Grove City Railway, Grove City, Pa., expects immediately to purchase two cars for its new line. John Carruthers is president.

San Francisco Municipal Railway, San Francisco, Cal., has ordered one work car body from the Pacific Car & Equipment Company, to be equipped with Westinghouse motors.

TRADE NOTES

Charles F. Etter, Harrisburg, Pa., manufacturer of ready change carriers for street railway conductors, has moved his Harrisburg office from 904 North Second Street to 907 North Front Street.

Ohmer Fare Register Company, Dayton, Ohio, has issued a folder describing the economical service provided by this system. The folder reports that since January, 1915, the company has received forty-three contracts covering various types of registers for registering collections ranging in denomination from two to sixty different classes of fares.

Spray Manufacturing Company, Boston, Mass., recently incorporated to construct spray cooling systems, gas scrubbers, odor and fume condensers, etc., has changed its name to the American Spray Company, as it will engage in general engineering work involved in the use of spray systems. The management of the company remains unchanged.

Pratt & Whitney Company, Hartford, Conn., has opened an office and showroom at 16 and 18 Fremont Street, San Francisco. S. G. Eastman, formerly manager of the Chicago office, is in charge. A large stock of machinery, small tools and gages will be carried for the convenience of customers. The company has been appointed agent for the entire Niles-Bement-Pond line of machine tools, cranes, steam hammers, etc.

International Oxygen Company, New York, N. Y., has received an order from the United States Navy Department for the erection of a hydrogen generating plant for ballooning purposes at the Aeronautic Station of the Navy Yard at Pensacola, Fla. This company has also received an order from the Government for the installation of a system for generating oxygen and hydrogen at the Washington Navy Yard, Washington, D. C.

Joseph T. Ryerson & Son, Chicago, Ill., have just completed new warehouses on Westside Avenue, Jersey City, N. J. The company has maintained an office at 30 Church Street, New York City, and steel warehouses at Boonton, N. J., for some time. This new move, however, will increase its stock and service to a marked degree and will mean a great deal in immediate shipments to steel buyers of the Eastern territory. The new warehouses have been built on a 10-acre site of the junction of the Hackensack River and Newark Bay, thus affording facilities for making water shipments to all parts of New York harbor and adjacent waters and for transshipment to ocean liners. The plant is provided with switches from the Central Railroad of New Jersey. The company has also acquired, in addition to the former trucking capacity, a fleet of motor trucks for making deliveries in Greater New York.

Latin-American Public Works Corporation is the name of a new company which will be organized for the general purpose of developing business in Latin-American countries. The activities of the company are to be directed specially toward the acquisition, on favorable terms, of concessions and contracts for public works and also of existing public utility or other properties which may require extension or improvement or both. It is also planned to conduct studies and investigations of business opportunities in South and Central America. The authorized capital will be \$1,000,000, divided into 10,000 shares of the par value of \$100 each. The shares will be all of one class, and there will be no

promotion profit of any kind whatever in connection with the organization of the company. It has also been arranged that a representative of the company shall visit some of the localities where the best opportunities now exist, for the purpose of securing, subject to the approval of the directors, such business as can be negotiated on a decidedly favorable basis. Application for a charter has been filed at Dover, Del. The incorporators are: J. G. White, president of J. G. White & Company, Inc.; Douglas I. McKay, assistant to the president J. G. White Engineering Corporation, and Severo Mallet-Prevost, of the firm of Curtis, Mallet-Prevost & Colt.

ADVERTISING LITERATURE

Templeton, Kenly & Company, Ltd., Chicago, Ill., have issued a catalog describing its various types of Simplex jacks for electric railway use. The catalog contains convenient instructions for the proper operation of these jacks when moving or setting machinery, such as lathes, lifting or straightening telephone or trolley poles or extricating trucks or removing wreckage from tracks. These jacks are made in a number of different sizes and capacities from that suitable for track or ballast work to that required for lifting heavy cars.

Sauvage-Ward Brake Company, New York, N. Y., has issued a catalog describing the savings effected in the life of brakeshoes by the use of its S. W. automatic shim slack adjusters. A 95 per cent increase of life for brakeshoes is asserted to have been saved on a certain road by the use of the slack adjuster. These adjusters have been adopted by seventy-five roads throughout the United States. The catalog contains a trial offer to equip from one to twenty-five cars at the expense of the manufacturer for a period of from two to three months.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 44407, which describes the GE-225-B, 600/1200-volt ventilated commutating pole railway motor. This type of motor has characteristics which adapt it especially to high-speed interurban service. It is built on substantial mechanical lines, and in details of design and construction follows the general GE practice for railway motors. The bulletin gives a complete description of the construction details and shows some characteristic operation curves. Bulletin No. 44090 gives an analysis of the equipment for various forms of up-to-date railway substations, and specifies suitable apparatus for different voltages. The details of the apparatus required are given for permanent indoor and outdoor substations, and also for portable substations. The bulletin is amply illustrated from photographs of typical installations, supplemented by detailed views of substation apparatus, complete tables of ratings and dimensions, together with drawings showing the location of the apparatus in both indoor and outdoor substations. This bulletin should be of particular interest to the practical railway operator for the reason that, in addition to the data specified above, it gives a very comprehensive set of railway switchboard wiring diagrams.

NEW PUBLICATIONS

The Utilities Magazine. Vol. I, No. 1, July, 1915, published by the Utilities Bureau, 216 City Hall, Philadelphia. Price, \$1 per copy.

The organization of the Utilities Bureau, as the outcome of the convention of mayors in Philadelphia last November, was reported at the time in the *ELECTRIC RAILWAY JOURNAL*. Under the direction of the bureau, of which Morris L. Cooke is acting director, "The Utilities Magazine" has been published "as one medium through which the Utilities Bureau will give to officials and city residents information of interest and usefulness in utility matters." The need of such a magazine is explained by the statement that "so many magazines misrepresent the truth as to public plants." The first number contains a digest of jitney ordinances, a discussion of the right of a plaintiff to examine the books and property of a utility company, the decision of the New York Public Service Commission, First District, in the New York Edison-Stadtlander case and one or two shorter articles. No statement appears in the first number as to whether the magazine is to be published at regular intervals or spasmodically.

No. 8

RECALLING PLANT STATISTICS

An engineer's ability to remember plant dimensions and the sizes and capacities of apparatus under his charge is not much of a test of his fitness to hold his position, but, for a little thing, a poor memory as to essential details unquestionably plays its part in giving a bad impression of an operating man on superficial acquaintance. Even at the cost of repeated efforts, it pays to remember such data as the general dimensions of boiler and engine rooms, the exact ratings, main dimensions and speeds of prime movers, height and diameter of the stack, dimensions of the more important pumps, capacity of the coal pocket and a few other "bird's-eye" statistics that visitors often inquire about. All of these data can, of course, be extracted instantly from a loose-leaf book, but useful as such a book is, it should not be allowed to become an entire substitute for the engineer's personal recollections. Prompt and accurate answers to questions about the plant indicate a live interest in its service with an alert and responsive mind, and defects in this direction are decidedly worth eliminating.

COASTING AND RUNNING TIME

When coasting recorders are first installed by a railway company its chief aim is to decrease the cost of energy and of brakeshoes. But experience has shown that the savings possible in another respect are far greater than either of these items. After the recorders have been in service for some months the men have approached the maximum percentage of coasting. Now, assuming the absence of severe down grades, this percentage of coasting is a good measure of the slack in the schedule running time. For example, if a line runs 35 per cent to 40 per cent coasting time it is evident that by a longer period of energy-using time the running time will be decreased. If a condition of this kind is developed on a line with, say, fifteen-minute headway and few cars the running time might be reduced to permit possibly a thirteen-minute headway with the same number of cars. In this case it might be found more profitable to get maximum coasting than to speed up the line, as the headway improvement might not be enough either to get more business or to cut out one car. On the other hand, if the line is operated on a five-minute headway a reduction of coasting time under conditions of maintained coasting ability would be far more likely to permit a reduction in the number of cars. Of course, some slack must always be allowed in any schedule, but when coasting regularly exceeds, say, 30 per cent, the economy of fewer cars for the same headway as before must greatly exceed the extra cost

of energy and brakeshoes. In short, in this relation of coasting to running time the coasting recorder has proved an even greater means of economy in practice than in theory.

SPECIFICATIONS AND PROGRESS

The increasing activity of the American Electric Railway Engineering Association and other organizations concerned with applied technology in preparing detail specifications of materials and appliances is a sign of the times. These are the contributions of the large roads to the small ones and are an evidence of a highly commendable spirit of co-operation. They constitute the text-book of the technical departments of the industry. They result from the combined efforts of user and manufacturer. Specifications are simply definitions of good usage in their field, and their purpose is not primarily to prevent manufacturers from foisting unsatisfactory products upon customers but rather to indicate the quality which is most suitable, that is to say, most economical, under given conditions. Specifications should lean toward a somewhat better quality than is absolutely necessary so that they may exert an influence in the direction of progress. This practice also provides a factor of safety and a reserve capacity. While specifications make dry reading, it is the manifest duty of the members of the Engineering Association to study those which have been laboriously prepared by their representatives in the committees and to apply them as far as possible. There will be an unusual opportunity for preconvention assimilation this year.

BEAM-TYPE TRACK FOUNDATION IMPROVED

While the old style, beam type of track foundation has been abandoned by most street railway companies the conclusion must by no means be drawn that improvements which overcome the disadvantages of this old type will not resurrect it. In this issue of the ELECTRIC RAILWAY JOURNAL E. R. Horton, Jr., of the Southern Public Utilities Company, is quoted as describing a type recently installed by that company. Improvements in his construction include an 8-in. plate under the rail base, intended to spread the track loads over a wider area on the beam and consequently to reduce or possibly to eliminate the tendency of the concrete to pulverize under traffic vibration. The reinforcement at the bottom of the beam should also prevent its breaking up under track loads when the sub-foundation is properly prepared. Hook bolts used to fasten the rail also serve to bind the beam and the rail together vertically. The hooks pass around the reinforcements in the bottom of the beam, hence provide a secure an-

chorage. Another feature in this construction is the provision of reinforcing channels under the joints in addition to the 8-in. plate under the rail. Wooden washers on the anchor bolts below this bearing plate provide for shrinkage in the concrete when it sets. Under track loads these washers will compress until the space beneath the bearing plates has been closed. It is quite possible that this form of construction will prove satisfactory on light traffic lines, and it may be that the improvements in the beam construction would give it merit under comparatively heavy traffic. In any event this foundation construction is worth watching to determine its serviceability.

TRANSMISSION LINE PROGRESS

Since the security of a transmission system depends chiefly on the performance of the line it is imperative to take every possible step toward securing continuity of service by suitable construction. In the case of traction lines in particular, the loss of power even for a short time works disaster. It not merely cuts off the load but disorganizes the system for a much longer time than that covered by the mere interruption. It therefore behooves the engineer to look a little way ahead and see what can be done to render the electrical supply more secure.

Taking up the situation as it stands, the three elements in line construction are the poles, the wires and the insulators. As regards the first-named there seems little doubt that, more and more, steel must be the material as it is now in a large number of cases. But when a steel line fails it is likely to fail rather badly, and, looking ahead, the indications are that whenever practicable one should not trust even to a single well-designed tower line but for many transmissions should provide a complete duplicate tower line. To do this economically means higher voltages than those commonly employed because the size of the members in the supporting structure must be determined by the stresses put upon it. A good deal of the work in the past has been on the basis of using public rights-of-way in such cases, and these have generally been fitted for modest voltages only. At present, when private rights-of-way are becoming common, there seems to be no good reason why the voltage should not be higher and hence the wires which have to be carried considerably lighter than they now average. As Dr. Steinmetz wisely remarked in a recent discussion, the insulator is no longer the weakest point in the line, and there is no good reason from the standpoint of insulation why the general average of working voltage could not be doubled with positive advantage. Given a light line, the conditions of supporting it become very much relieved so that it should be possible to use fairly long spans on lighter supporting structures than are now usual.

As regards the line itself experience has shown that failure of the wires, except from short-circuits, is a very unusual contingency. Break-downs, when they occur, are commonly at the supports, and the wires

themselves are not at fault. As a rule, even under the most severe conditions, when storms cause the failure of many electrical circuits, transmission lines come through all right. As regards the insulators, there is no difficulty now in taking care of 50,000 or 60,000 volts as easily as half this pressure was handled a few years ago. The suspension insulator has saved the day for high voltages, and on more modest ones such as those mentioned renders it easy to get a large factor of safety. Lightning is the most serious danger to be considered, and it seems to have been sufficiently well demonstrated that not even well-installed ground cables can entirely relieve transmission lines from this particular risk. The use of arc extinguishing devices seems to offer a very considerable measure of relief and deserves more extensive use than at present.

The general line of progress then would seem to be the employment of rather high voltages with duplicate main supply lines, suspension insulators giving a large factor of safety, and persistent study of methods of lessening the danger from lightning which at present is dominant.

A YEAR OF THE DEPARTMENT ON "EQUIPMENT AND ITS MAINTENANCE"

When the subscribers to a periodical become contributors in large numbers direct evidence is afforded that they are active rather than passive readers. This condition indicates that degree of intimacy between readers and editors which is essential if the paper is to serve its clientele in a truly successful way. From this point of view the editors of the *ELECTRIC RAILWAY JOURNAL* view with satisfaction the record of the department on "Equipment and Its Maintenance." This department now numbers in its widening circle of contributors more than a hundred men who are directly engaged in using and bettering electric railway equipment.

With the first issue of the *ELECTRIC RAILWAY JOURNAL* for 1914 the practice of segregating short articles on details of equipment practice was inaugurated. Allowing a half-year for the promotion or accelerating period we may consider that the new department was well under way by the end of June, 1914, and therefore completed a year of mature life a few weeks ago. An examination of the pages devoted to this department will show how fully the results justify the effort to secure descriptions of those devices and methods which have produced maintenance economies or aided equipment reliability.

During the period mentioned signed articles from ninety-five writers, located in sixty-one cities in twenty-two States and five foreign countries were published. Omitting the numerous descriptions of recent manufacturing developments there were 217 signed and eighty-six unsigned editorial and contributed articles in the following divisions of the electric railway field: Shops and shop practices, eighty-two, or 27 per cent; car equipment, fifty-four, or 17 $\frac{3}{4}$ per cent; track and paving, forty-five, or 14 $\frac{3}{4}$ per cent; power generation and

distribution, thirty-seven, or $12\frac{1}{4}$ per cent; transportation kinks, twenty-nine, or $9\frac{5}{8}$ per cent; overhead and return circuit, twenty-seven, or 9 per cent; cars and car construction, twenty, or $6\frac{5}{8}$ per cent, and records and costs, nine, or 3 per cent. In addition every new device of interest to railway men, of which information could be obtained, was carefully described. No expense has been spared in the effort to give the man in the shop, on the line and the track or in the power house, the information which he needs but finds it difficult to get.

A comparison of the above data with the tabulated results of an analysis of readers' preferences, printed on page 52 of the issue of this paper for Jan. 2, 1915, indicates that the supply of articles follows closely the desires of the readers. The canvass made last year showed that a very considerable portion of the readers take great interest in the department on equipment and maintenance, although at that time it was still in its infancy.

It is obvious that this department of the paper more than any other must depend upon the co-operation of those who benefit from its work. Its future is in the hands of its friends. The editors look forward to the time when each of several hundred successful equipment men will send in, as a matter of course, short descriptions of every new "stunt" which makes their own work lighter. With the field work of its own staff supplemented in this manner, the ELECTRIC RAILWAY JOURNAL well may claim that it is in the closest touch with every worth-while development of electric railway operation.

INFLUENCE OF AUTOMOBILES IN DENVER

The actual figures submitted with the exceptionally thorough traffic analysis that is outlined on another page of this issue by Roger W. Toll, chief engineer Denver Tramway Company, have a value that is largely local; at the same time, the inferences that may be drawn from them can hardly fail to be of general interest. The most striking feature is, of course, the fact that the automobile and bicycle combined appeared to have gained during the year almost exactly what the street cars lost. Compared with the preceding year, the net decrease in total traffic, including pedestrians, was 1.2 per cent, but, strange to say, there was practically an equal decrease in the number of pedestrians, so that the total number of riders of all classes actually remained the same as on the corresponding count during the preceding year.

The gain for the automobile was equivalent to about 8 per cent of the street car passengers, and the increase was caused by three factors, namely, an increased number of trips per day, an increased number of passengers per trip, and an increased number of automobiles in service. Although the latter factor is the largest of the three, its importance is minimized by the fact that the bulk of the street railway traffic is, of necessity, drawn from that part of the population which does not

own automobiles and never will do so unless unforeseen reductions in the cost of their maintenance and housing take place.

The thing that is important is that the use of individual automobiles is evidently extending. If this extension is caused by an increase of those who ride principally for entertainment and would not patronize the street cars if automobiles were not available, there is nothing very alarming about the movement. On the other hand, if these riders are drawn from the ranks of the railway's patrons, the result will be a diminution of receipts that will ultimately become a very serious matter.

However, every figure in the Denver analysis is in support of the first-mentioned possibility, and therein the results are distinctly encouraging. It is apparent from the report that the travel for purely business purposes (not for amusement), included in the 1915 totals of the Denver traffic, is less than in 1914, the condition being due, no doubt, to the business depression accompanying the European war. Evidence to this effect will be found in the decreased total travel, in the decreased number of men on freight vehicles, and above all, in the marked decrease in the number of pedestrians. Consequently, the total number of riders of all classes should have decreased also under the influence of these abnormal circumstances.

The fact that the total number of riders actually remained constant can be ascribed only to non-business riders in automobiles. In short, it appears to be unlikely that the increased use of the automobile, as recorded, came about by anything other than joy-riding, so that after all, the gasoline vehicle could not have been a basic cause of the street railway's traffic loss. As a matter of fact, the 9 per cent loss of the street railway might well be considered as a natural sequence of the 4 per cent decrease in pedestrians, and, although the decreased walking might appear to indicate an increased riding habit, it could do so only in times of business prosperity that would be accompanied by a great increase in total travel in and out of the business district.

Among the other interesting items that appear in the analysis is that of a 10 per cent increase in the use of the bicycle. We had been of the opinion that this form of locomotion had become a negligible consideration, yet in Denver it appears to serve some 5 per cent of the traffic, a figure which may be otherwise expressed as a number equal to no less than one-fifth of the number of pedestrians. The freight automobile also shows up in an interesting light, as the increase for the year was offset by the retirement of roughly the same number of horse-drawn trucks, about four of the latter making way for three of the former. From the figures, the rate of replacement of horse-drawn trucks by automobile trucks appears to be less than 10 per cent per year, and if this is the case in general, the gasoline truck can hardly be such a gold mine as it is pictured by some of its advocates.

Safety of Trains on the Chicago Elevated

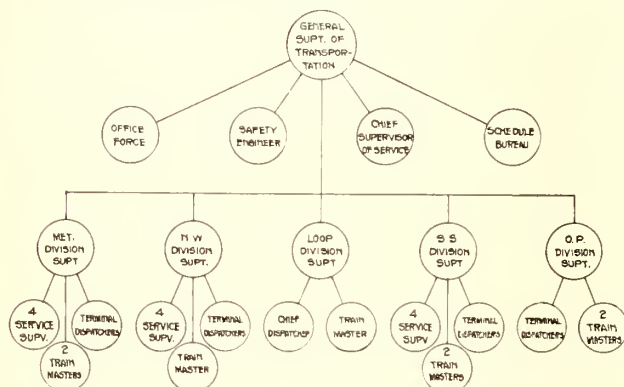

The Organization of This Property Has Been Built Around the Safety Idea—Special Fitness for Safe Train Operation Governs the Selection of All Employees

More and more interest is taken by the traveling public in the protective measures provided by transportation companies. This is justly so and, in recognition of this fact, a general outline of that part of the organization of the Elevated Railroads of Chicago, Ill., bearing most directly on the safety of their patrons is given.

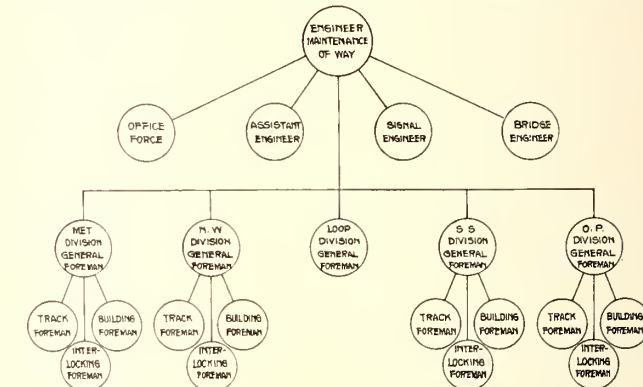

The Elevated Railroads of Chicago transport 170,000,000 people annually, hence the responsibility for their welfare and safety is not a light one, a fact which is thoroughly appreciated by both the management and the employees. They believe that safety is, after all, largely a matter of the personal equation, and to get the proper results great care is exercised in the selection of men for each responsible position. After that, the make-up and routine of the organization enters very largely into the kind of results that are obtained.

the dispatching of trains are stationed at each of the terminals. All of these transportation officials have been promoted through the ranks, the dispatchers and service inspectors being selected from the motormen and switchmen classes and the superintendents and trainmasters from the dispatchers. A chart of this organization is shown in one of the illustrations.

Selecting and training the rank and file of the transportation department also receive careful attention. The first step to obtain employment on the Elevated Railroads after being tentatively appointed as an extra trainman, is the physical examination by the medical examiner, Dr. H. E. Fisher, whose methods have been described in detail in the ELECTRIC RAILWAY JOURNAL, issues of June 26 and Aug. 7, 1915. An extra trainman is instructed for a period of one week by an experienced conductor in the proper handling of gates,

SAFETY ON CHICAGO ELEVATED—ORGANIZATION CHART OF TRANSPORTATION DEPARTMENT

SAFETY ON CHICAGO ELEVATED—ORGANIZATION CHART OF MAINTENANCE OF WAY DEPARTMENT

Accordingly, a description is given of the operating and maintenance departments, their relation to the special work of the safety engineer and his committees, and the work of the medical department as it bears on the safety both of employees and passengers.

TRANSPORTATION DEPARTMENT ORGANIZATION AND METHODS

First in the public mind, so far as safe operation is concerned, is the transportation department because it is this department with which the public is in closest contact. The head of this department is M. J. Feron, general superintendent of transportation, who has been twenty years in the service, having started as a switchman and advanced from dispatcher, trainmaster and division superintendent to his present position. Previous to entering the service of the Elevated Railroads Mr. Feron was for several years in the operating department of the Chicago & Northwestern Railroad.

Under the general superintendent, there are five division superintendents in direct control of train operation in their respective parts of the city. Each of these division superintendents has his office and corps of assistants at a convenient point on the division. The assistants of the division superintendents are the day and night trainmasters and the service inspectors. There are four to each division, and to supervise the operation of the trains and the crews, they are kept on the road continually. Dispatchers who are in immediate charge of the motormen and trainmen and

bell signals and calling stations. He must serve as an extra trainman for two or three years before he is given a regular run. To break in as conductor, the trainman is taken to the yards and shops and instructed in the mechanical and electrical features of the equipment. To break in as motorman he must make a more detailed study of the equipment, after which he is required to spend about three months in learning to handle a train and to read signals in actual operation. At the end of this time the extra trainman is certified by the instructing motorman, after which he is finally examined by the trainmaster and division superintendent to determine his fitness. If these various tests are passed satisfactorily, the student is eligible to work as an extra motorman.

An applicant may break in as a switchman or towerman, providing that he shows sufficient aptitude for this work to give his superiors confidence that he will make good. In either of these classes he is instructed by a regular towerman or switchman, certified and finally examined by the trainmaster and the superintendent. A towerman also must be examined regarding mechanical and electrical details of a plant by the division interlocking foreman. From the foregoing, it will be appreciated that much attention is given to schooling prospective employees. Moreover, after a man is considered qualified for the service, he is closely supervised by the department and a permanent record of his work is kept for reference. In this connection it is interesting to show a list of the periods of em-

ployment of the regular motormen and conductors who have been in the employ of the Elevated Railroads of Chicago for periods varying from five to twenty-three years:

Period of Employment	Motormen	Conductors
Less than six years.....
Six to ten years.....	114	247
Ten to fifteen years.....	149	102
Fifteen to twenty years.....	97	21
Twenty to twenty-three years.....	57	5
Total number at present employed.....	417	375

WAY DEPARTMENT ORGANIZATION AND WORK

Public interest is next attracted to the maintenance of way department, which maintains the tracks, structure, signals and buildings in proper condition for the operation of trains. At the head of this department is B. J. Fallon, engineer maintenance of way, who has been eight years with the Elevated Railroads in this capacity, and eight years in the engineering department of the Chicago, Burlington & Quincy Railroad. Immediately under him is an assistant engineer, who has been in the service ten years, and a signal engineer who supervises and inspects all signal and interlocking work, who has also had ten years' experience with the signals. The way department staff also includes a bridge engineer, who supervises and inspects the elevated structure, bridges and buildings.

A general foreman is in charge of the men in the maintenance of way department on each one of the five divisions of the elevated lines. He has full supervision of all the work of this department and inspects the condition of the property periodically. The physical property under this foreman is divided into the following three classes; track work, structure and buildings, and interlocking and signal devices. An experienced foreman is in charge of each class on each division, and he in turn is aided by competent assistant foremen.

All electrical work, including the maintenance and installation of electrical circuits and the third-rail, is handled by a separate department. This is under the electrical engineer, who with his assistant has jurisdiction over the division electrical foremen. There are about sixty men engaged in the work of the electrical

SAFETY ON CHICAGO ELEVATED—VIEW AT JUNCTION SHOWING HEAVY EXTRA GUARD RAILS AND FIRST-AID STATION SIGN

department, outside of power houses and substations. These, together with the regular force of the maintenance of way department, comprise about 300 men. This number is increased by approximately 200 men during the months from April to November, when most of the construction and rehabilitation work is done.

At each track junction on the Elevated Railroad system a modern interlocking plant has been installed. These plants protect all train movements on tracks through the junctions, and are so constructed that the failure of any part of the apparatus automatically stops all traffic on the tracks controlled by the plant. All of these plants are under the direct inspection of experienced interlocking repairmen, one or more being stationed at each important junction.

Each of the five elevated railroads is divided into track sections, and a number of section men or track walkers are regularly assigned to each. These men continually walk and inspect their track sections and make all light repairs necessary for safe operation. Extensive repairs and renewals are made by track con-

SAFETY ON CHICAGO ELEVATED—VIEW OF CROWDED TRANSFER PLATFORM AND BRIDGE. ALSO SHOWS CLOSE TIE SPACING

SAFETY ON CHICAGO ELEVATED—VIEW OF SIGNAL AND TRIP IN STOP POSITION

struction gangs. During the last several years the Elevated Railroads have maintained a large force of extra men to improve the various physical features of the property. Tie renewals are constantly necessary and in addition, as shown in one of the illustrations on page 303 of a crowded loop platform, the ties have been placed unusually close together. This was done throughout the Union Loop to deaden noise and at the same time it resulted in a perfectly safe track without the use of tie plates. Incidentally at all platforms where crowds assemble during the morning and evening rushes several guards are stationed to safeguard the public.

The loop junction at Fifth Avenue and Lake Street, illustrated on page 303, shows a special outer guard rail of very heavy construction. This has been provided along track special work to keep inside the outer guard rails any cars which may be derailed. Another of the accompanying illustrations of the same junction shows a track trip installed beside the semaphore signal. In case a train fails to stop at this signal the trip sets the air brakes. The signal set at danger, the track trip and the diverting track terminating at a bumping post installed each side of a bridge are also shown in one of the illustrations. In case the bridge is open and a motorman runs by the signal, the train will take the diverting track and at the same time the brakes will be thrown into "emergency" by the track trip. The foregoing protective devices are typical of the unusual precautions taken within the last few years by the Elevated Railroads of Chicago to avoid accidents. This is true not only of the operation of trains, but the principle has been applied to every department of this railroad.

THE SAFETY ORGANIZATION

The management of the elevated railroads was quick to recognize the value of the safety-first movement, and a number of years ago perfected a permanent safety organization. Experience soon demonstrated that satisfactory safety work could only be accomplished by forming special organizations and committees to supplement and co-operate with the regular operating organization. All safety work is under the supervision of J. H. Mallon, safety engineer. He is aided by a central committee composed of two department heads and himself. In addition, there are four division safety committees working in conjunction with the central committee. The chairman of these division committees is the division superintendent. He is aided by the division general foreman of the way department, and the

other committee members are the division general foreman of the shop department, the supervisor of service and a representative from the claim department. Thus a diversity of viewpoints is brought to bear on all safety problems.

All of the safety committees hold weekly meetings at which they discuss suggested improvements, and the causes of accidents that may have occurred, while from time to time inspections are made. A record is kept of each committee meeting. These records are exchanged with the other committees and in this way all committees may benefit. Safety suggestions are submitted to the department heads or the general manager for action.

Each month the central committee publishes a "Safety Bulletin," which keeps constantly before the men the principles of safety. The articles contained in these bulletins are written by employees and department heads. To supplement the bulletin, the safety engineer periodically gives lantern slide lectures, both for employees and the public.

Perhaps the most unique and helpful feature of the safety work of this company is a carefully prepared "Safety Rule Book." This is given to each employee upon entering the service, along with a safety-first button which is worn quite generally. The safety rule book is a compendium of the findings of the safety organization since its inception. Through it the new employee may benefit by the experience of his predecessors. The contents of this rule book are revised and extended from time to time to keep it up to date. It was carefully compiled by the department heads so that not only is the motorman able to see at a glance the rules for the safe handling of a train, but the line-man has before him the rules for safe handling of live conductors. The back of the rule book contains complete first-aid instructions. In the maintenance of way, shop and electrical departments, these rules are read and discussed periodically.

SAFETY IN THE MEDICAL DEPARTMENT

The medical department plays an important part in safeguarding and assuring the patrons of the Elevated Railroads of Chicago that every possible precaution is taken for their safety. The public scarcely realizes the results that are accomplished by the safety movement or the vast amount of detail necessary to assure the success of a crusade for the protection of human life. The company surgeon believes that it is essential that a public service company employ only men and women who are physically fit and not handicapped by poor

SAFETY ON CHICAGO ELEVATED—VIEW OF DIVERTING TRACK AND SIGNALS AT A CHICAGO RIVER BRIDGE

health or physical defects. Transportation or railroad work is hazardous at best and for that reason it is especially necessary to have men in charge of the operation of trains who will assure the maximum degree of safety to the thousands of passengers intrusted to their care.

To guard against physical defects being either the direct or indirect cause of accidents, the medical department was organized. When an applicant seeks a position in any of the departments, he is obliged to undergo a thorough physical examination to ascertain whether he is physically equipped to bear the responsibilities which will devolve upon him. In the train service every employee and applicant has his sight, hearing, color sense and physical condition carefully examined. Only those men are employed who have successfully passed the medical examination, hence equal the standard set by the medical department.

Perfect sight is essential to safe train movements, as a trainman must be able to see long distances perfectly to interpret signals. At night the safety of train operation is largely controlled by the signal lights, and for that reason it is necessary that an employee have perfect color vision or perception. Unfortunately, it is a fact that the two colors that are most often confused by people who are color blind are the two principal colors used for train operation, viz., red and green. The public quickly appreciates the great care that must be exercised in examining trainmen for this condition, as it is the chief factor in assuring safety at night.

Trainmen must have perfect hearing to be efficient, a fact so readily recognized that further comment is unnecessary. To insure safety in operation, railroads can hold no place for men with weak hearts or any heart disease. Quite frequently the heart fails at the critical moment when a trainman should have full possession of all of his faculties. All employees are examined every two years, and all new men are examined at the time of entrance into the service. Every employee in every department except the office force and the ticket agents receives a physical examination, and each department has a set of standard physical requirements.

The medical department has organized and had in practical operation for two years a first-aid-to-the-

ELEVATED	
SAFETY FIRST	CHICAGO,191..
This is to certify that I,, was called to the office of the Superintendent of the Metropolitan West Side Elevated Railway Company on theday191.. and instructed as to the safe and proper way to run my train when working as motorman.	
I was positively forbidden by the Superintendent to ever take a train out on the road, from any yard or terminal, before testing the brakes on my train, and I was instructed that I must be positive and sure brakes are working properly on all cars on my train before starting out with same.	
He also called my especial attention to the danger of rounding curves at a higher speed than that designated on Speed Boards placed at the entrance to all curves.	
My attention was also called to the extra caution I must take when operating over the road in foggy, thick or stormy weather, and I thoroughly understand that I must always operate my train, and have it under such control, that I am positive I can stop in the distance I can see.	
This especially so, in foggy weather, or when my view is obstructed from any other cause.	
Signed in presence of.....	
This.....day of191..	

SAFETY ON CHICAGO ELEVATED—RECORD OF CAUTIONING TRAINMAN

injured system. Regardless of all the safety-first measures adopted there will be accidents, and to meet these emergencies the first-aid system was inaugurated. It includes more than 100 first-aid stations located at frequent intervals over the entire mileage. At each station is a complete surgical and medical outfit containing all the necessary supplies required to give aid. Each station is designated by a red cross in a white circle conspicuously displayed. In connection with the first-aid system it was necessary to train employees in the rendering of intelligent first aid. More than 400 employees of the Elevated Railroads have received lectures and practical demonstrations in giving first-aid treatment, and the work of these men during the past two years has been instrumental in saving a number of lives and in preventing complications in injuries.

From the foregoing the valuable work accomplished by this class of procedure may be readily observed. It assures passengers on the elevated trains that the men in charge are in good physical condition and that their health is constantly under observation. It also assures the public that in time of accident when injuries may occur there are at hand the necessary first-aid supplies and employees competent to render the necessary relief until a physician arrives.

Standards for Graphic Presentation

The joint committee on the above subject, comprising representatives of sixteen national societies and the United States Bureau of Standards, has prepared a preliminary report which is being published by the American Society of Mechanical Engineers, by which the committee was organized. The committee makes a number of suggestions regarding the preparation of diagrams and illustrates these by means of typical diagrams. The purpose of these suggestions is to foster the development of as uniform a style in the making of diagrams as is possible. This will increase the legibility of diagrams and will tend to promote the use of graphical presentation of data. The suggestions in general conform to usual good practice which they merely attempt to codify. Sample suggestions are these: "For a curve the vertical scale, whenever practicable, should be so selected that the zero line will appear on the diagram. If the zero line of the vertical scale will not normally appear on the curve diagram, the zero line should be shown by the use of a horizontal break in the diagram. The zero lines of the scales for a curve should be sharply distinguished from the other co-ordinate lines." Copies of the report can be secured from the A. S. M. E. office, 29 West Thirty-ninth Street, New York, N. Y., at 10 cents each.

THE METROPOLITAN WEST SIDE ELEVATED RAILWAY COMPANY

CHICAGO.....191..

INSTRUCTION BLANK

Motorman..... Badge No.

Mr..... student motorman, has been assigned to you to be instructed in the duties of a motorman. You must see that the student thoroughly understands the operation of a train in accordance with the rules and regulations of this Company, and is fully acquainted with all conditions, a knowledge of which is necessary for safe operation. You will be in charge of the train and will be responsible for its safe operation.

You will permit the student to operate the train only when in your judgment it is safe to do so.

You will keep close by your student so as to be able to act quickly.

When following train ahead closely, or approaching signals, keep right at the student's elbow.

Keep a specially close watch when the rail is bad.

I have instructed student motorman..... badge No....., in the safe operation of a train in service, and have fully acquainted him with all signals, speed limits, station stops, and general conditions existing on the..... branch.....191.. Signed.....

I have received instructions from the motorman whose name appears above in the safe operation of a train in service, and have been fully advised as to all signals, speed limits, station stops and general conditions existing on this railroad.....191.. Signed.....

Mr. J. A. Jarvis,
Asst. Superintendent.

Dear Sir:

I have examined the student whose name appears above, and am fully satisfied that he is competent to operate a train with safety and according to rules and regulations of this Company.....191.. Signed.....

SAFETY ON CHICAGO ELEVATED—INSTRUCTION FORM LETTER TO MOTORMAN

Operating Cost and Shifts in Service

Cost of Service Should be Considered in Making Schedules—Increased Rush-Hour Service Causes Higher Unit Costs—Standard Is Greatest Good to Greatest Number

BY F. W. DOOLITTLE, DIRECTOR BUREAU OF FARE RESEARCH, AMERICAN ELECTRIC RAILWAY ASSOCIATION

The peculiarities of traffic, and the various methods used to determine them with the idea of using the information in the construction of time-tables, were discussed at some length in a previous article.* Before proceeding with a further discussion of schedules, however, it will be well to consider in some detail the fact that the "car-hour" is not a basic unit of cost. It is obvious that while the average cost of operation per car-hour may be \$2.75, it will cost a company very much more than \$27.50 to place ten cars in service for an hour at the time of the evening rush. This fact, which is evident upon a consideration of the factors entering into cost, is made the basis of the present article, in which it is shown that the schedule which provides for the smallest number of standing passengers is not a schedule which keeps constant throughout the day the relation between seats and passengers. In other words, a standard for car loading permitting more passengers per car during rush hours than at other times is justified on the grounds of the greatest good to the greatest number of passengers.

In the example which is here worked out, it is shown that, owing to the high cost of rush-hour service, the use of a lower standard of car loading at that time permits a saving of 350 car-hours, which, with advantage to the patrons and at the same cost to the company, can be replaced by 890 car-hours during other periods of the day—a gain of 540 car-hours for the use of the passengers. The net result in the case assumed is the seating of 16,950 more passengers out of a total of 300,000 riding.

The first step is the determination of the cost of operation per car-hour at different periods of the day, operating expenses and depreciation, taxes and return on investment being taken into account. When a detailed study is undertaken of each element of cost, the effect of the occurrence of a large part of the riding during two short periods of the day—or "concentration of traffic"—is strikingly evident. The increased unit costs following increased service during the rush hour arise from a number of facts, among which are:

1. Operating expenses for platform labor are materially increased per car-hour run where additional service is furnished for short periods. Under usual operating conditions, only a limited number of men can be secured for rush-hour service at the usual rates, in anticipation of advancement to full day runs. Additional inducements must be made in order to secure labor for a few hours per day. The operating conditions of the company do not readily present other types of employment by which such labor can be employed during non-rush hours in order to secure a full day's work.

2. Rush-hour service creates a peak on the generating plant and the cost per kilowatt-hour for electrical energy for cars is much increased during such peak periods. Investment in necessary generator and transmission capacity must lie idle during the greater portion of the day and in readiness for rush-hour service. The ordinary fixed charges upon such investment cannot be spread over the company's output, as would be

the case where the service furnished had a demand uniform throughout the twenty-four hours.

3. The liability to accident during rush hours is proportionately greater than during non-rush hours, owing to the congested condition of the streets and the haste of passengers at these periods.

4. Investment in additional cars, car-housing facilities and car-handling facilities, being idle during the non-rush hour period of the day, fixed charges upon such investment are accordingly higher per unit of service during the rush hours.

The results of this study of costs may be stated in two ways. In the first place, Table I shows for a hypothetical urban electric railway the costs per car-hour at different periods of the day and the cost for each increase in the number of car-hours per hour. For instance, an increase of 3650 car-hours over the service rendered from 6 a. m. to 7 a. m. costs \$6 per car-hour, and a similar increase from 160,600 car-hours between 6 p. m. and 7 p. m. to 164,250 car-hours between 5 p. m. and 6 p. m. costs \$11.50 per car-hour. This illustrates very forcefully the fact that in the construction of time-tables attention cannot be confined to car-hours to the

TABLE I—SHOWING INCREMENT COSTS FOR CAR-HOUR

Period of Day	Car Hours per Hour per Period of Day	Increment in "Car-Hours per Hour"	Total Costs per Hour per Period of Day	Increment in Total Costs	Cost per Car-Hour for Period of Day	Costs per Car-Hour for Each Increment in Car Hours per Hour
12 a. m.—5 a. m.	6,570	\$17,322	\$2.635	\$2.635
5 a. m.—6 a. m.	41,975	35,405	101,778	\$84,456	2.420	2.385
8 p. m.—12 p. m.	70,445	28,470	170,436	68,658	2.420	2.410

Note.—This table is based on one year's operation.

TRAFFIC SURVEY—FIG. 1—SHOWING INDEX OF CONCENTRATION OR DEVIATION FROM UNIFORM SERVICE

*ELECTRIC RAILWAY JOURNAL, July 17, 1915, page 94.

TRAFFIC SURVEY—FIG. 2—SHOWING HOURLY RELATION BETWEEN PASSENGER TRAFFIC AND SERVICE ON TWO DIFFERENT BASES

exclusion of the time of day at which they occur. Reduced to its simplest terms, the proposition gains force. Compare the cost of operating twenty-four cars between 5 p. m. and 6 p. m. with the cost of operating one throughout the twenty-four hours. This seems too elementary to warrant statement, but it has been so often overlooked, in attempts to regulate service by those unacquainted with the facts, as to make its inclusion here important.

The second way of stating the results of the studies of costs above referred to involves a measure of the concentration of the service rendered as shown by the cars in service at different hours of the day. Assuming as the zero of concentration, from which to measure, a schedule which is uniform throughout the twenty-four hours, it is obvious that 10 per cent of the service is rendered in 10 per cent of the time, 20 per cent of the service in 20 per cent of the time, 70 per cent of the service in 70 per cent of the time, etc. Taking the schedule of cars in use on the lines of a typical company, it was found that in one hour, or $4\frac{1}{6}$ per cent of the time, only 1 per cent of the car-hours occurred; in the six hours when the fewest cars were in service, or 25 per cent of the time, $7\frac{2}{3}$ per cent of the car-hours; in 75 per cent of the time, $52\frac{2}{3}$ per cent of the car-hours, etc. This is shown more fully in Table II. The use of this means of measuring concentration and its relation to cost assumes of course the same general distribution of traffic throughout the day as indicated in Fig. 2.

The sum of the numbers used to measure the amount by which the service varies from uniformity or the in-

TABLE II—SHOWING PERCENTAGE RELATION BETWEEN TIME AND CAR HOURS

Total difference or index of concentration..... 410

dex of concentration is 410. A company with a less pronounced peak load would show a smaller figure and one with a peak greater than normal a larger figure than this as a measure of its deviation from uniformity. Fig. 1 shows the results of a series of computations along this line.

The application, to a particular case, of the data from which Fig. 1 was drawn is shown in Fig. 2. The line A-A represents passengers and the line B-B cars in service at each hour. It will be observed that the line B-B follows proportionately the variations in the line A-A, keeping constant the relation between service and traffic. Table II, based on the data from which the line B-B was drawn, shows the deviation from uniformity to be 410. Assuming that 6000 car-hours distributed as indicated by the line B-B exhaust the financial ability

of the company to provide service, it will be found by reference to Fig. 1 that if service can be so distributed as to reduce the deviation from uniformity from 410 to 325, the cost per car-hour will be but 92 per cent as great and consequently the number of car-hours which the company is financially able to supply will be 6000 divided by 0.92, or 6540. Service on this basis is shown by the line C-C.

It is of interest to note that the 160 car-hours in the morning and the 190 car-hours in the evening, 350 in all, have been replaced with 890, leaving a net gain of 540 car-hours. The distribution of car-hours indicated by the line C-C is the more common, but it is immaterial to the company whether, under the conditions stated, 6000 or 6540 car-hours are provided each day. Such redistributions of car-hours as are frequently

TABLE III—SHOWING RELATIVE SERVICE FURNISHED UNDER PLANS INDICATED BY LINES C-C AND B-B IN FIG. 2

desired by patrons should be considered, however, as depending upon the ability and willingness of the patrons to pay for them, and when there is no other determining factor on the basis of the greatest good to the greatest number.

On the assumption that the line *C-C* represents service sufficient to provide a seat per passenger from 8 a. m. to 4 p. m., it will be of interest to note the relative service furnished under the two plans indicated by the lines *C-C* and *B-B*, as measured by the percentage of passengers seated at the point of maximum loading. Under the method of procedure previously outlined, Table III has been computed and it is found that the advantage of lower off-peak costs has been utilized to seat about 17,000 additional passengers out of 300,000, or 5.6 per cent.

In all the above computations, it is assumed that the average length of ride is the same throughout the day, and that the same routing is employed under both schedules. This permits the quality of service to be measured by the number of passengers standing at the point of heaviest loading. A more critical analysis would consider in addition the miles ridden by standing passengers.

The foregoing is set forth in some detail as furnishing a mental background which is very necessary if the maker of time-tables is not to be drawn into unwise and expensive deviations from what his company can do in the way of providing car-hours without being neglectful of the interests of the capital which makes the transportation industry possible.

Railway Co-operating to Beautify Towns

Along the Louisville & Eastern division of the Louisville & Interurban Railway there are several suburban towns in which the "community beautiful" movement has been receiving attention. The town of Anchorage, for instance, engaged a landscape architect to make plans for it, while the people harbor a desire to see the railway replace its present station with something more to their liking. O'Bannon's, Pewee Valley and Crestwood, also have their own particular movements. In so far as it is possible the railway is co-operating. R. H. Wyatt, freight and passenger agent of the company, described what the company had done at O'Bannon's to satisfy the people. The station there was located for purely utilitarian purposes. When the landscape gardening fever struck the community Mr. Wyatt was visited by a delegation of citizens who suggested that the station be faced differently. It was agreed that the commuters were right, and a gang of men with jack-screws and rollers relocated the station in a way that met the idea of the landscape artists. Planting around the station grounds and grading of unequal places, etc., is making progress. It is felt that co-operation with the local residents wherever possible is good business for the traction company.

The Fort Wayne & North Indiana Traction Company, Fort Wayne, Ind., is holding safety-first meetings for employees in which recreation, entertainment and instruction are provided. The day employees were taken to Robinson Park recently for an evening outing. James M. Barrett, president of the company, was the principal speaker at this meeting. A meeting was held in the Holman Street carhouse at 12.30 o'clock midnight for the night employees, at which S. W. Greenland, general manager of the company, made an address. Similar meetings will be held by the company at Lafayette, Ind., and Logansport, Ind.

Operation of Safety Zones in Kansas City

"Safety zone" standards were recently set up on several of the downtown crossings of Kansas City, Mo. Their use is being tested, as well as the methods of placing them. Temporarily, they are placed 7 ft. from the nearest rail, and about 50 ft. apart, in pairs, defining a zone within which persons boarding or leaving cars may be safe from vehicle traffic, as shown in the accompanying illustration. It is likely that lines may be painted on the pavement defining the safety zones, and extending to the sidewalks so as to indicate more clearly to pedestrians crossing the road the exact straight course they should take. There is still some confusion among motor car drivers, because of the ordinance prohibiting automobiles from passing a car taking on or discharging passengers, and requiring the automobiles to stop 10 ft. from such a car. The new rules will allow automobiles to pass standing cars, but probably at slow speed. Some streets are so narrow that automobiles cannot safely pass the cars, and in these streets they are being allowed to follow the cars through the zones on the tracks. There was opposition from the police to the installing of the standards, because of the problem of their care at night. However, the police are temporarily caring for the standards,

KANSAS CITY SAFETY ZONES IN OPERATION

removing them to the sidewalks at night, and replacing them at 8 a. m. It is possible that the standards may be discarded when the lines showing the zones are painted. The present standards are about 5 ft. high, on bases about 16 in. in diameter, with circular white-painted signs on top, bearing the following wording: "Safety Zone," "Load," "Stop." The face "Stop" stands at the point where the motorman stops the front end of the car. The face "Load" is at the rear end. The reverse of each standard bears the words "Safety Zone."

The crossings at which the safety zones can be established, the width of the zones, and the regulations as to motor car and vehicular traffic are now the subject of study by the experts of the board of control. So far the public has shown timidity about standing in the zones, and an almost unconquerable inclination to wait until the last minute, as under previous conditions, before approaching the car. It is believed, however, that when patrons learn to reach the safety zones by way of the street crossings, and that it will be reasonably safe there while they wait for the car, traffic will be very greatly expedited. The recent growing tendency to disembark by the front doors is an important factor in promoting the utility of the zones, since passengers can immediately mingle with the pedestrian stream at the crossings.

Traffic Investigation in Denver

Counts of All Vehicles and Pedestrians Passing Into and Out of the Business District Showed a Marked Increase of Automobile and Bicycle Traffic Notwithstanding an Actual Decrease in the Total Traffic Compared with That of Last Year

BY ROGER W. TOLL, CHIEF ENGINEER DENVER TRAMWAY COMPANY

In order to obtain information as to the relative importance of the various methods of city transportation in Denver, a traffic investigation was conducted in May, 1915, under the direction of John A. Beeler, vice-president Denver Tramway Company, as a supplement to the investigation of the year before which was reported in the *ELECTRIC RAILWAY JOURNAL* for Aug. 29, 1914, page 380. As it was desired to investigate traffic conditions on Sunday as well as on a weekday, the recent investigation covered two days, namely, Sunday, May 9, and Tuesday, May 11. The weather was good on both of these days, and the results obtained represent typical traffic conditions.

The basis of the investigation was a count of all persons and vehicles entering and leaving the business district of the city upon the dates selected, the assumed boundaries including the greater part of the retail and wholesale districts of the city as well as a portion of the railroad terminal yards. Observations were taken under the direction of J. D. Rich of the engineering department, and the data collected were also compiled by him. Through the valued co-operation of W. M. Casey, W. H. Seip and J. L. Adams of the transportation department, trainmen were secured as observers, and because of their interest in the work and conscientious attention to duty, the results obtained are accurate and reliable.

It was desired to make a complete count of all traffic entering and leaving the entire district in a single day, and as the number of available observers was limited, it was necessary to use a long shift. Thirty-nine men were on duty for a continuous eighteen-hour period from 6 a. m. until midnight. In order to provide for meals and short rests, a relief, consisting of four men, was maintained from 9 a. m. until midnight. Each relief man was assigned to a certain number of the observers, each of whom he relieved three times during the eighteen hours for a period of one-half hour.

Thirty-eight thoroughfares cross the assumed boundaries of the business district. In the case of a few streets with very light traffic, one observer could record the traffic on two streets, but as a rule a man was stationed at each street entering the district, and, owing to particularly heavy traffic, two simultaneous observers were placed at each of the four busiest locations, and by dividing the work reliable results were secured. Observations were recorded in half-hour periods throughout the eighteen-hour day. To make the data comparable to the data on street car passengers, children under six years old were not counted.

NUMBER OF PERSONS INBOUND AND OUTBOUND

Table I shows the number of persons entering and leaving the business district by each method of transportation, exclusive of street cars, on Sunday, May 9, and Tuesday, May 11, respectively. The excess of inbound pedestrians over outbound pedestrians was 5261, which agrees closely with last year's results and indicates that more people walk to business than walk home.

Table II shows a comparison of the Sunday and Tuesday traffic as to the total number of persons entering and leaving the business district, exclusive of street

car traffic. This table shows the large increase of passenger automobile traffic on Sunday, amounting to 41.6 per cent, and also the decrease of freight traffic, both automobile and horse-drawn, amounting respectively to 77.7 per cent and 83.8 per cent. The great decrease in bicycle traffic, amounting to 59.3 per cent, shows that most of the bicycles are not used for pleasure, but primarily either for transportation to and from work or for business purposes. A large part of the bicycles are used by messenger boys and delivery boys.

Table III shows a comparison of the records obtained last year and this year, relative to the total number of persons counted. An increase of 6.8 per cent is shown in the total number of persons entering and leaving the business district, exclusive of street car traffic. A considerable variation is to be expected from one day

to another, in the same month, due to weather and other conditions, and therefore too great weight should not be given to this increase in any general conclusion regarding the two years. However, a comparison of the results of the two days is very valuable. The total number of persons in passenger automobiles shows an increase of 53 per cent and the number of persons in freight automobiles increased 46 per cent. Much smaller gains are shown in the motorcycle traffic and bicycle traffic, while the horse-drawn traffic, both passenger and freight, and the pedestrians count have each decreased by a small percentage. The comparison, as a whole, shows a decided increase in automobile transportation.

The number of vehicles entering and leaving the

business district was recorded, as well as the number of persons in the vehicles. Table IV shows the vehicular count on May 9 and May 11, and Table V shows a comparison of the totals of the vehicle count on these two days, together with the average number of persons carried by each class of vehicle. The marked decrease in the use of freight vehicles, both motor and horse-drawn, is to be expected on Sunday. The large decrease in the use of bicycles, above referred to, may also be noted. The use of passenger horse-drawn vehicles also decreased on Sunday, showing that this class of transportation is used more for business purposes than pleasure.

The number of passenger automobile trips and motorcycle trips remained about the same, numerically, on Sunday as on the weekday count, but it was very evident that their use on Sunday was largely for pleasure trips. This is also indicated by the increased number of passengers per vehicle on Sunday for both autos and motorcycles. Incidentally, the number of vehicles of each class entering and leaving the business district in any one day should balance almost exactly, and Table IV furnishes a good indication of the degree of accuracy obtained in the traffic count.

Table VI gives a comparison between the vehicle counts obtained last year and this year. The total trips on Tuesday, May 11, this year show an increase of 12.7 per cent over the total trips of last year. The number of passenger automobile trips shows 38.6 per cent increase, and the number of freight automobile trips shows an even greater percentage of increase. Motorcycles and bicycles show small increases, but horse-drawn vehicles, both passenger and freight, show a decrease. These comparisons are closely analogous to the comparisons, for the two years, of the total number of persons, as shown in Table III. In each case, the number of passengers per vehicle is nearly the same for both years.

The passenger automobile is shown as the most numerous class of vehicle, with the bicycle in second place and the horse-drawn freight vehicle in third place. Last year the horse-drawn freight vehicle had first place, the bicycle second place and the passenger automobile third place.

The ratio of the motorcycle trips to the bicycle trips is 1 to 5.6 as compared with the ratio last year of 1 to 5.4. This indicates that the bicycle is holding its own as compared with the motorcycle. The ratio of the freight auto trips to the passenger auto trips is 1 to 6.1, as compared with the ratio of last year, which was 1 to 6.5. Of the horse-drawn vehicle trips, 86 per cent were for freight purposes, which is the same percentage as that of last year. Of the total vehicle trips, 31 per cent were for freight purposes, as against 35 per cent for last year. Contrary to last year's records, the automobile trips are in excess of the horse-drawn vehicle trips, being 37 per cent of the total number of vehicles, as compared with 30 per cent for the horse-drawn vehicles. Last year, these percentages were exactly reversed.

The accompanying chart shows graphically the number of persons entering and leaving the business district during each half hour of the day for each method of transportation on Sunday, May 9, 1915. This indicates that the Sunday peak for automobiles occurred at about 5 p. m., but that the peak for pedestrians was not reached until nearly three hours later.

CAR TRAFFIC

The best statistics that are available for comparison with street traffic are the figures of total passengers carried in the city, regardless of the business district. This comparison, while it is the best available, is on a

TABLE IV—INBOUND AND OUTBOUND STREET TRAFFIC—VEHICLES

somewhat different basis, since a certain proportion of the passengers carried on cars do not enter the business district. The car data, therefore, included all of that class of traffic in the entire city, while the street traffic data are confined to that crossing the boundaries of the business district.

The total passengers carried by the city cars on May 9 and 11 of this year were as follows: Sunday, May 9,

DENVER TRAFFIC—CHART SHOWING NUMBER OF PERSONS ENTERING AND LEAVING BUSINESS DISTRICT DURING SUNDAY

TABLE VII—COMPARISON OF RAILWAY AND STREET TRAFFIC—SUNDAY AND WEEKDAY
Totals of Persons on Sunday, May 9, 1915, and Tuesday, May 11, 1915

Method of Transportation	Sunday, 5/9/15		Tuesday, 5/11/15		Increase		Decrease	
	Persons	Per Cent	Persons	Per Cent	Persons	Per Cent	Persons	Per Cent
Street cars	201,005	51.4	183,888	46.9	17,117	9.3

Freight horse-drawn vehicles	25,344	6.4	23,122	5.9	2,222	8.8
Pedestrians	106,990	27.0	102,901	26.3	4,089	3.8
Total	396,250	100.	391,495	100.	4,755	1.2

1915, 201,005 passengers; Tuesday, May 11, 1915, 183,888 passengers.

As noted above, no observations were taken of the street traffic between the hours of midnight and 6 a. m. It is estimated that only 1 per cent of the total traffic for the twenty-four hours passes in and out of the business district during this six-hour period, so that the figures obtained for the street traffic represent 99 per cent of the total for the twenty-four-hour day.

Regarding the effect of weather conditions upon street traffic and car passengers, some observations were taken on two successive Sundays in May, the first being cold and windy and the second warm and mild. On the pleasant Sunday there was an increase of 11.1 per cent in the number of passengers carried on the street cars, and an increase of 32.8 per cent in the number of persons traveling by other methods.

It therefore seems that while the weather has a decided effect upon Sunday street car travel, its effect upon other methods of travel is still more pronounced.

Table VII shows a comparison of the total traffic on Sunday, May 9, and Tuesday, May 11, of this year. The number of passengers carried by the cars in the entire city is combined with the total street traffic in and out of the business district. An interesting coincidence is seen in the fact that the total number of persons traveling on these two days is almost identical. With the population of Denver in the neighborhood of 200,000, the above total represents an average of one trip in and out of the business district per person per day.

Table VIII shows a similar combination and comparison for Tuesday, May 5, of last year and Tuesday, May 11, of this year. As will be noted in this table, the total travel is 1.2 per cent less for 1915 as compared

with 1914, the car travel on these two days showing a decrease of 8.9 per cent for 1915, and the total street traffic showing an increase of 6.8 per cent over the previous year.

On Tuesday, May 5, 1914, the total number of persons carried on the street cars and in passenger automobiles was 232,598. Passenger automobiles carried 13.2 per cent and the street cars 86.8 per cent of this number. On Tuesday, May 11, 1915, the total number of persons carried by these two methods of transportation was 230,413, passenger automobiles carrying 20.2 per cent and street cars 79.8 per cent. On Sunday, May 9, 1915, the total number of persons carried by these two methods was 266,907, passenger automobiles carrying 24.8 per cent and street cars 75.2 per cent.

The number of persons carried by the street cars, expressed as a multiple of the number of persons carried by passenger automobiles, is as follows: Tuesday, May 5, 1914, 6.6; Tuesday, May 11, 1915, 3.9; Sunday, May 9, 1915, 3.1.

AUTOMOBILE TRAFFIC

It may be assumed that the number of automobiles in use in Denver at the time of the traffic count was the same as the number registered by owners at that time, namely, 6000. This is an increase of 1372 over the corresponding figures of 4630 for the previous year, the number of motorcycle licenses being 927 in 1914 and 944 in 1915.* The vehicle count on Tuesday, May 11, showed the total number of automobile trips in and out of the city as 27,771. The percentage of trips made by freight automobiles was 14 per cent of the total automobile trips. Freight autos make more trips per day, in and out of the business district, than passenger automobiles do, and it is assumed that 7 per cent of the total autos are freight vehicles. This is consistent with the figures of the United States Census Bureau, that from 4 per cent to 7 per cent of the automobiles produced are for freight purposes. Therefore, the number of passenger automobiles in use in Denver is 93 per cent of 6000, or 5580. Roughly speaking, the average passenger automobile makes two round trips, or four single trips, per day in and out of the business district, and carries two people per trip, making a total of eight passenger trips per day. The exact figures for Tuesday, May 11, establish the average number of single trips per day at 4.27, the average number of passengers per trip at 1.95, and the average number of passengers per day at 8.35, as compared with 7.1 for last year. Both the number of trips per auto per day and the number of passengers carried have increased.

If this average rate of 8.35 passengers per day is maintained through the year, an auto would carry 3000 passengers per year.

Assuming the population of Denver at 200,000 and the number of passenger automobiles in use at 5580, there is an average of one auto to every thirty-six persons, or one to every eight families.

A "Denver Automobile Directory" has been published, containing the registration number, name and address of owner, and make of automobile, for all 1915 registrations up to March 13. This directory contains 5340 registrations, and it shows that the business district has the most dense ownership owing to the many machines owned by firms for business purposes, in either freight or passenger service. Of the 5340 autos, 1317, or 25 per cent, are Fords, the figures for the entire United States showing that 33 per cent of the cars in use are Fords. Comparison of a map showing distribution of population with one showing location of automobiles indicates that the distribution of automobiles is in general similar to the distribution of the population.

DENVER TRAFFIC—GRAPHIC COMPARISON OF WEEKDAY TRAVEL, EXCLUSIVE OF THAT IN FREIGHT VEHICLES

*There are no jitneys in Denver. [Eds.]

Mesaba Railway's New Repair Shops and Office Building

These New Buildings Replace Those Which Were Destroyed by Fire in November, 1913, and Contain a Number of Interesting Features—Details of Construction and Description of the Various Shops Are Given

BY GOTHARD SARGL, SUPERINTENDENT OF CONSTRUCTION CLEVELAND (OHIO) CONSTRUCTION COMPANY

After a year in temporary quarters following the disastrous fire which destroyed the shops and office building, the Mesaba Railway office and repair force is now housed in new quarters. Situated on the frontier of Minnesota, 80 miles north of Duluth, the nearest city of any size, the Mesaba Railway, a 35-mile interurban road, connects a number of villages and mine locations in the Mesaba Iron Range. The construction features of this road were described in the Jan. 10, 1914, issue of the *ELECTRIC RAILWAY JOURNAL* on page 68.

REPAIR SHOP CONSTRUCTION DETAILS

Essentially the new layout conformed to the original plan in that the foundations of the original repair shop were used and a separate office and dispatcher's building constructed. In addition, a paint shop, also in a separate building and more than 60 ft. away from the repair shop, was also provided.

The new repair shop is a brick, steel and concrete structure, 86 ft. x 122 ft. in plan. This area is divided into a car-storage bay and repair and machine-shop bay a portion of which is given over for a storeroom and a heating plant. A 13-in. fire wall extending 3 ft. above the roof separates the car-storage bay from the repair-shop bay. Trackage in each of these sections provides for the storage of four cars, and all of the car-storage space in the repair-shop bay is constructed over repair pits.

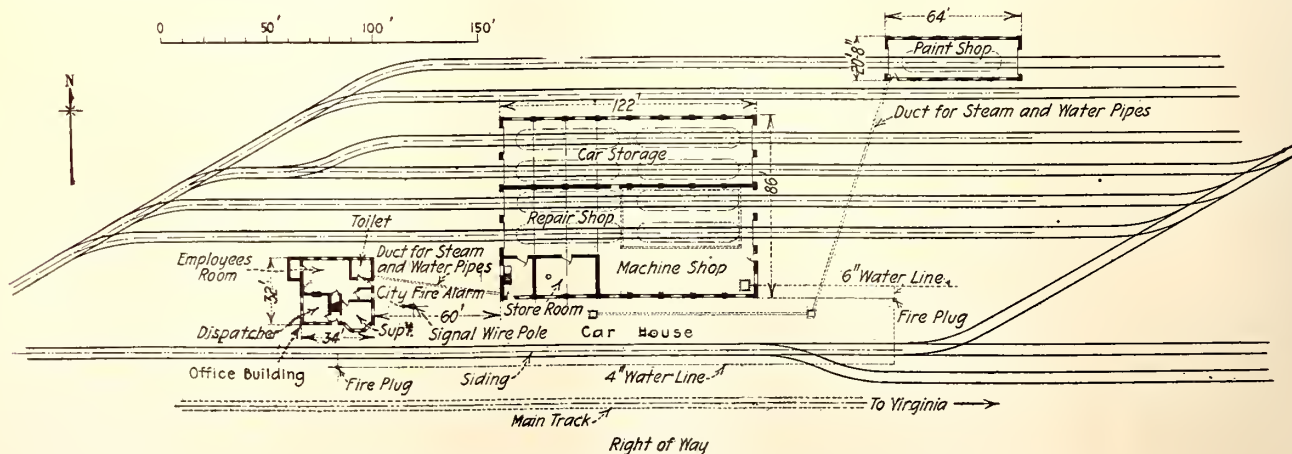

Following the fire the original pits were restored with timber which was permitted to remain in the new structure. These pits were extended, however, so that storage space was provided for four cars. The pits in this extension are of concrete construction, and it is contemplated that later the old wooden pits will be replaced with others built of concrete. Experience during the first winter in this extremely cold climate demonstrated that additional pit area was necessary to thaw out the cars. To minimize the time required to thaw out the frozen car equipment, however, radiation considerably in excess of that ordinarily required was installed on the pit walls.

Steel trusses supported on the brick walls span each bay, and in the intervals between these are concrete roof slabs reinforced with Ferroinclave and carried on steel purlins. These slabs are $1\frac{3}{8}$ in. thick, formed of 1 in. of concrete on the upper side of the reinforcement, 3 in. on the under side and covered with a five-ply tar and gravel roofing. Eight flat wire-glass skylight openings were provided in the roof along the fire wall to provide a uniform natural illumination in all parts of the building. A liberal spacing of windows in the side and end walls of the repair shop section insures ample natural illumination in all parts of the machine shop. The four car door openings at each end of the building are 12 ft. wide by 16 ft. 6 in. high and are equipped with Kinnear rolling steel doors. The openings in the fire wall between the two bays and those leading to the storeroom and boiler room are fitted with standard Underwriter's fire doors.

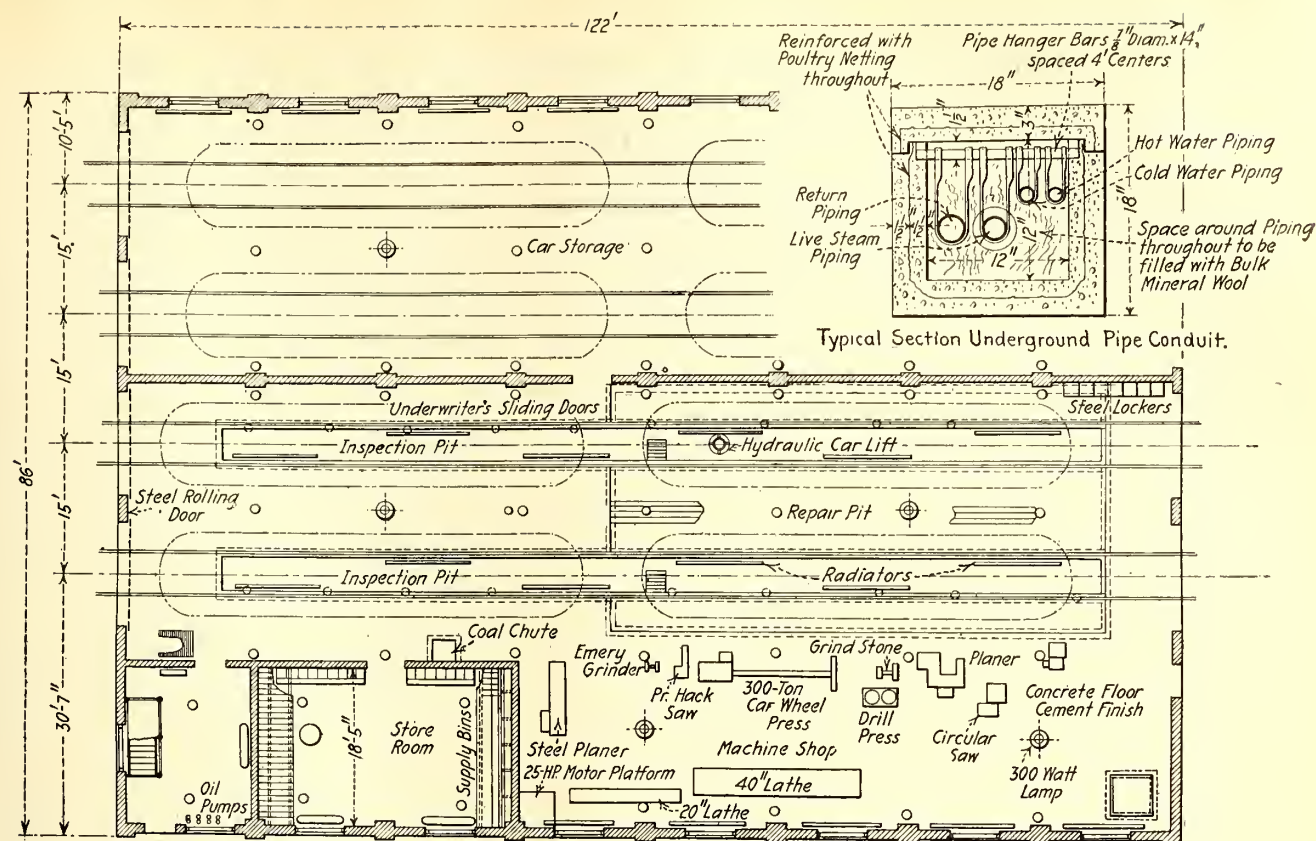

Three 2-in. hose connections with hose and racks were installed in the repair shop building, and two standard fire hydrants were provided in the storage yard adjoining the building. In addition to these a Gamewell fire-alarm box connected to the Virginia city fire alarm system was installed near the office building so that the city fire department may be called. Water is supplied to the fire-protection system through a 6-in. water main which connects to the city water system.

ARRANGEMENTS OF SHOPS AND EQUIPMENT

Conveniently located in the repair-shop bay beside the repair pits in a space 25 ft. wide by 75 ft. long is the machine shop. This contains the usual machine tool equipment necessary to handle all repair work, all driven from an overhead line shaft which is belted to a 25-hp. three-phase, 600-volt induction motor. Energy is supplied to this motor through a three-phase line from the company's power house. The hoists in the repair shop include a hydraulic lift for handling armatures, motors and truck parts, and two 8-ton Yale & Towne chain blocks suspended from one of the roof trusses and used for lifting car bodies.

MESABA REPAIR SHOPS—GENERAL PLAN OF PROPERTY

MESABA REPAIR SHOPS—PLAN OF SHOPS AND SECTION THROUGH PIPE CONDUIT

Energy for lighting is obtained from the 600-volt, single-phase motor service which is stepped down to 110 volts through a $7\frac{1}{2}$ -kva. transformer. All wiring in the carhouse is installed in conduit, and tungsten lamps on brewery cord drops furnish individual illumination. In addition to these six 300-watt nitrogen-filled lamps with Abolite shades were installed in the repair shop and car-storage bay for general illumination. All the lighting circuits are controlled from a cabinet situated in the passageway beside the storeroom.

Installed in the basement below the storeroom is a low-pressure heating plant of sufficient capacity to heat the repair shop, paint shop and office building, as well as the manager's residence, which is situated about 600 ft. from the carhouse. All radiation is of the wall type, except that in the storeroom and passageway, and is so installed on the walls and between the columns that the radiators occupy very little floor space. The radiation in the pits is fastened to the concrete walls and to the supporting timbers of the wooden constructed section. A hot water tank in the boiler room supplies the office and paint shop. In one corner of the boiler room four Bowser oil tanks containing lubricating and signal oils have been installed. These tanks are equipped with measuring pumps located on the main floor.

Situated about 60 ft. from the repair shop building is a brick and concrete paint shop, 20 ft. 8 in. x 64 ft. in size. The walls of this building are 9 in. thick with 4-in. x 26-in. pilasters, and the roof is a 3-in. reinforced-concrete slab supported on ten 9-in. I-beams and covered with a five-ply tar and gravel roof. Suitable ventilation is supplied by three Ohio Blower Company's 16-in., Swartwout, rotary ball-bearing ventilators. The size of this building is just sufficient to accommodate one car, one track of the yard lay-out passing through the building. The track entrances to this building are fitted with Kinnear steel rolling doors, and the window openings are equipped with Fenestra steel sashes glazed

with $\frac{1}{8}$ -in. ribbed glass. Other construction details include concrete floors, wooden trolley trough and ten drop lights wired in conduit. Three attachment plug outlets on the side walls were supplied for extension cord connections.

OTHER FEATURES

The new office building is a two-story frame and brick structure situated 60 ft. from the car repair shop building. An unusual feature in the construction of this building was the provision of an entirely fireproof room to contain the dispatcher's equipment. This room is surrounded with 9-in. brick partition walls and has a reinforced-concrete ceiling and sub-floor. Openings from this room to the interior building are protected with Kinnear steel rolling fire doors. Added importance is given the protection of the dispatcher because his outfit includes a Simmen automatic railway signal dispatcher's board.

To protect the records of the road a 5-ft. 9-in. x 8-ft. 8-in. reinforced-concrete vault occupies one corner of the office building and extends the full height of the two floors. In connection with this vault it is interesting to note that the one now serving the first floor was formerly on the second floor of the original office building. At that time this vault was supported on steel columns and during the fire it fell from the second story to the ground. This caused no apparent injury and all the records in the vault were fully protected.

An interesting feature in connection with the electric wiring of the office building, as well as the manager's residence, is that the wiring provides for electrical heating. Separate circuits in conduit run from the lighting cabinet to baseboard receptacles in each office room. To these ordinary car bank-heaters are connected during the cold spring and autumn days when steam heat is unnecessary but some heat is required in the office and residence.

Digest of Jitney Ordinances*

Fundamental Provisions and Important Details of Ordinances for the Regulation of Jitney Traffic in American Cities Are Abstracted and Compared

BY CLYDE LYNDON KING, PH.D.

This digest was made from ordinances sent to The Utilities Bureau in response to a request made to the mayor of every city and town of considerable size in the United States. The ordinances used have all been received since June 15. The text gives as succinctly as possible the provisions found in the ordinances of the various cities, the names of which are, for each provision, given in the foot-notes.

A typical definition of the jitney or the motor bus, as regulated by these ordinances, is found in the jitney ordinance of Dallas, Tex. This ordinance makes subject to its provisions and the rulings of the authorities made thereunder "any automobile, auto truck or trackless motor vehicle engaged in the business of carrying passengers for hire within the city limits of Dallas, which is held out or announced by sign, voice, writing, device or advertisement, to operate or run, or which is intended to be operated or run, over a particular street or route, or to any particular or designated point or between particular points, or to or within any designated territory, district or zone." Many of the ordinances, as does that of Spokane, Wash., specifically exclude cabs, taxicabs, automobiles for hire, stages running on regular schedules and used exclusively for transporting passengers from points outside of the city, sight-seeing buses, hotel buses, hearses, ambulances, pall-bearers' vehicles, and railway or street cars.

The usual method by which regulation is assured is that of requiring the owner or operator of each such vehicle to secure a permit or license¹ as a prerequisite to the privilege of using the streets and other public places as a common carrier. As pay for this supervision, or as a source of revenue to the city, or both, license fees are required, though these are so evidently exorbitant in some instances as to raise the presumption that they are more a means for abolishing the jitney than regulating it.

LICENSE FEES AND OTHER CHARGES

License fees are occasionally designated as definite sums to be paid annually, regardless of the seating capacity of the vehicle. In the larger majority of the ordinances, however, the amounts of the license fees are very properly based on seating capacity, as the relation between seating capacity and wear and tear on streets, as well as earning power, is quite direct. Where the ordinances require flat-rate license fees, the sums specified include: \$5,² \$10,³ \$25,⁴ \$30,⁵ \$50,⁶ \$60⁷ and \$75.⁸ In general, when based on seating capacity, the license fees range from \$25 for a car carrying five or less to \$200 for cars carrying more than sixteen.⁹

In addition to the annual license fees certain other charges incidental thereto are sometimes required. These charges are 50 cents,¹⁰ \$1,¹¹ \$2¹² and \$2.50.¹³

BONDS OR INSURANCE POLICIES

Bonds or insurance policies are often required as a protection against injury of persons or destruction of property. These bonds are usually conditioned, as in Utica, N. Y., that "licensees will indemnify and save harmless the city of Utica, N. Y., and its officers or agents, from any and all causes and actions, and the costs and expenses of defending same, growing out of the operation of motor-propelled vehicles . . . " and "satisfy any and all judgments by any person, firm or corporation for personal injury or property damage caused by the operation of said licensed vehicle, upon, in and over the streets and public places of Utica, N. Y."¹⁴

Not all the cities by any means require bonds or insurance policies.¹⁵ The amounts of the bonds or insurance policies in the ordinances of two cities¹⁶ are stated to be such as are "reasonable." The amounts designated in other cities include: \$1,000,¹⁷ \$2,000,¹⁸ \$2,500,¹⁹ \$5,000²⁰

teen to twenty-six, \$35; more than twenty-five, \$40; Oklahoma City, Okla., eight or less, \$50; eight to twelve, \$75; twelve or more, \$150; Syracuse, N. Y., five or less, \$75; five to ten, \$100; ten to fifteen, \$125; more than fifteen, \$150; Huntington, W. Va., four or less, \$50; five or more, \$75; Tulsa, Okla., \$5 for each passenger seat with a minimum of \$20; Schenectady, N. Y., as many times \$5 as number of passengers, with a minimum of \$25; Galveston, Tex., five, including driver, \$30; five to seven, including driver, \$35; more than seven, including driver, \$45; Grand Rapids, Mich., \$3.50 for each passenger, maximum fee, \$50, payable in advance; Louisville, Ky., eight or less, \$10; nine to fifteen, \$20; more than fifteen, \$25; Pasadena, Cal., five or less, including driver, \$30; more than five, less than eight, \$35; more than seven, less than sixteen, \$45; more than fifteen, less than thirty, \$55; thirty persons or more, \$75; Providence, R. I., \$5 per seat exclusive of driver's seat, maximum fee, \$50; if route extends into another town requiring license, fee of \$3 per seat; Little Rock, Ark., per month, five to seven, including chauffeur, \$3; eight to twelve, \$6; twelve or more, \$8; San Antonio, Tex., seven seats or less, \$25; each seat more than seven, \$3.50; Fresno, Cal., five or less, including driver, \$40; five or more, \$50; more than seven, less than sixteen \$60; more than fifteen, less than thirty, \$75; thirty or more, \$100; Portland, Ore., per month, seven or less, \$2; more than seven, \$2, and 25 cents for each seat in excess of seven; Long Beach, Cal., six or less, including driver, \$25; more than six and less than ten, \$30; more than nine and less than sixteen, \$35; more than sixteen and less than thirty, \$75; Fort Smith, Ark., \$20 per year, \$12.50 for six months, payable in advance; Tacoma, Wash., per month, five persons or less, \$1; more than five, 25 cents in addition to \$1 for each additional seat; driver's license, \$1; renewal of driver's license, \$1; transfer of license, 50 cents; Ogden City, Utah, not exceeding five, \$75; five to ten, \$100; ten to twenty, \$150, payable in advance; if route extends beyond limits of city license fee shall be \$25 per annum; driver must pay \$1 for permit and badge; Fort Worth, Tex., change of license, 50 cents; five or less, including driver, \$10; seven or less, more than five, \$20; more than seven, \$30.

¹⁰ Pueblo, Col.; Tacoma, Wash. (for transfer of license); Fort Worth, Tex. (for changing license); Grand Rapids, Mich.; Oakland, Cal.

¹¹ Schenectady, N. Y. (driver's license); Providence, R. I.; Augusta, Ga. (for badge); Los Angeles, Cal.; Dallas, Tex. (for substituting one car for another, altering cars or losing license plate); Ogden City, Utah (\$1 for permit or badge).

¹² Birmingham, Ala.; Tacoma, Wash.

¹³ Seattle, Wash., and Spokane, Wash. (renewal, \$1; reissue, \$1.50); El Paso, Tex. (for changing route or termini, \$2.50, and for examination, \$2.50).

¹⁴ The ordinance of Louisville, Ky., requires that the bond be conditioned that the person injured or having his property damaged through defect or negligence in operation has a right to action; that the applicant pay all sums due the city, such as licenses, taxes, fines and forfeitures, and indemnify the city against any loss and damages for accidents.

¹⁵ Salem, Mass.; Dallas, Tex., and Portland, Ore., do not, among others.

¹⁶ Pine Bluff, Ark., and Fitchburg, Mass. (determined by Mayor or Board of Aldermen).

¹⁷ Lansing, Mich. (conditioned on observing provisions of charter and ordinance and duties of common carrier).

¹⁸ Little Rock, Ark., and Fort Smith, Ark.

¹⁹ Fort Worth, Tex.; Austin, Tex. (\$2,500 to any one person, and \$5,000 for all damages on account of death or injuries of all persons occurring in one accident).

²⁰ Huntington, W. Va.; Louisville, Ky.; San Antonio, Tex.

*Reprinted from *The Utilities Magazine*, July, 1915, by permission of The Utilities Bureau, Philadelphia, Pa.

¹ In Denver, Col., a franchise is required.

² Orange, N. J.; Battle Creek, Mich.; Staunton, Va. (the fee is \$6); Little Rock, Ark.

³ Lansing, Mich. (\$5 for the second and \$2 for each additional vehicle); Warren, Pa. (hacks only—no jitneys).

⁴ Ashtabula, Ohio; Ocean City, Passaic, N. J. (\$5.50 per year for automobile hacks); Fulton, N. Y.

⁵ Norfolk, Va.

⁶ Oakland, Cal.

⁷ Pueblo, Col.; El Paso, Tex.

⁸ Dallas, Tex.

⁹ The license fees based on carrying capacity are as follows for various cities: Davenport, Ia., seven or less, \$25; seven, \$35; seven or more, \$50; Utica, N. Y., five or less, \$75; five to eight, \$100; eight to sixteen, \$150; sixteen or more, \$200; Augusta, Ga., five or less, \$25; five to seven, \$35; seven or more, \$50; Austin, Tex., five or less, \$50; seven or less, \$75; eight or more, \$100; Joplin, Mo., five or less, \$10; five to eight, \$15; seven to thirteen, \$20; twelve to seventeen, \$25; six-

and \$10,000.²¹ Other cities base the amount of the bond or insurance policy on the carrying capacity of the respective cars.²²

QUALIFICATIONS OF DRIVERS

Proper qualifications for drivers are assured in the great majority of ordinances by requiring at least that the application for the license or permit shall indicate for all chauffeurs the name, age, residence, address, previous addresses, length of residence in each, whether previously engaged in transporting passengers for hire, nationality, married or single, and experience in driving.²³ In addition to this a few cities definitely require testimony of two citizens, or other similar evidence, as to the moral character of the driver.²¹ With one exception,²⁴ the age limits, if stated in the ordinances, are either eighteen years of age or more,²⁵ or twenty-one or more.²⁷ Occasionally the chauffeur is required to carry with him at all times an identification card, including his photograph,²⁸ while a number of ordinances particularly require that the chauffeur shall give evidence as to sober habits, or that he is not addicted to the use of liquors or drugs.²⁹ Occasionally there is a specific requirement that the chauffeur shall be able to speak the English language.³⁰ Written or oral examination is sometimes specifically required as to the driver's knowledge of the ordinances and traffic regulations of the city and state.³¹ Very frequently the chauffeur must give evidence as to his ability to drive a car, and also evidence that he has no physical disabilities, such as being deaf, or partially deaf, near-sighted, etc.,³² and occasionally must take a medical examination to show that he is not subject to epilepsy, vertigo, heart trouble, color-

blindness, or any other infirmity of body or mind which would disqualify him from serving as a driver of a public vehicle.

ROUTES AND TERMINI

It is a usual provision of the jitney bus ordinance to require that the operator shall set forth in his application or in his permit the route over which it is proposed to operate such motor bus and the terminal points of such routes, and to require, though less often, a map of the route or the designation of the particular street or streets over which the vehicle is to run.³⁴ In a few ordinances the routes and termini are to be indicated by signs only, the authorities not assuming any other control thereover.³⁵ Many of the ordinances requiring routes to be designated also require that the vehicles shall not depart from this route, and must go to the end of the route on each trip.³⁶ When routes must be specified before the permit or license to operate the bus is granted, authority is usually either reserved by the Council or delegated to specified city officials to change or modify the route at any time.³⁷ A few ordinances specifically make it unlawful to deviate from the route established, or, if deviation is necessary, the vehicle must return to the point of deviation as soon as possible and proceed in the direction the motor was headed before deviation.³⁸ In order to retain for the city one of the chief advantages of motor transit, mobility, certain ordinances particularly provide that buses may deviate from their designated routes for stated purposes.³⁹ Legible signs which can be read at a distance of 100 ft. or more are particularly required, setting forth the fare, the termini and the routes.⁴⁰

How long the route shall be is not readily discernible on examination of an ordinance, as the length is usually expressed by names of streets. Austin, Tex., requires that they must average at least thirty blocks, and Davenport, Iowa, requires that when the route of a motor bus parallels a street-car line, its termini shall be that of the car line or beyond, unless the Council otherwise decides. In the cities where the routes over which the vehicle is to run must be specified in the application the proper authority would have the power to lengthen or shorten the route. Certain ordinances definitely provide that the route may be changed at any time by the Council, the Board of Police Commissioners, or other

(\$5,000 the maximum for one person, and \$10,000 for one accident); Memphis, Tenn. (for each car for one accident); Taunton, Mass. (\$5,000 for one vehicle and \$1,000 for each additional vehicle); Pasadena, Cal. (\$5,000 for any one person injured, and \$10,000 for all persons injured in any one accident); same in Long Beach, Cal., and Tulsa, Okla.; Duluth, Minn.; Syracuse, N. Y. (limited to \$15,000 for one accident); Oakland, Cal. (\$5,000 for any one person injured; \$10,000 for any one accident resulting in injuries to or death of more than one person); San Antonio, Tex. (a total of \$50,000 for five vehicles or less, or a total of \$100,000 for any number of vehicles in excess of five); Melrose, Mass.

²¹ Pueblo, Col.; Oklahoma City, Okla.; Ogden City, Utah (if more than one car, \$20,000); Fresno, Cal.; El Paso, Tex. (\$10,000 for each car up to ten cars, and \$500 for each additional car).

²² Grand Rapids, Mich., seven persons or less, \$10,000 for damages or accidents; \$2,000 for each passenger more than seven; up to \$10,000. Schenectady, N. Y., as many times \$1,000 as carrying capacity of car, but at least \$5,000. Ashtabula, Ohio, in lieu of liability insurance policy, a bond of \$3,000 for buses carrying nine persons or less, and \$5,000 for more than nine persons. Utica, N. Y., eight passengers or less, \$10,000; eight to sixteen passengers, \$15,000; sixteen or more, \$20,000.

²³ Ogden City, Utah; Dallas, Tex.; Lansing, Mich.; Davenport, Iowa; Spokane, Wash.; Austin, Tex.; Joplin, Mo.; Oklahoma City, Okla.; Birmingham, Ala.; Seattle, Wash.; Providence, R. I.; Fitchburg, Mass.; Grand Rapids, Mich.; Long Beach, Cal.; Louisville, Ky.; Los Angeles, Cal.; Duluth, Minn.; Oakland, Cal.; Pasadena, Cal.; Tacoma, Wash.; Schenectady, N. Y.; Fort Worth, Tex.; San Antonio, Tex.

²⁴ Davenport, Iowa; Spokane, Wash.; Joplin, Mo.; Seattle, Wash.; Galveston, Tex.; Grand Rapids, Mich.; Little Rock, Ark.; Oakland, Cal. ("worthy"); Schenectady, N. Y.

²⁵ Long Beach, Cal.

²⁶ Birmingham, Ala.; Austin, Tex.; Fresno, Cal. (and under fifty); Providence, R. I. (over twenty); Fitchburg, Mass.; Syracuse, N. Y.; Grand Rapids, Mich.; Little Rock, Ark.; Tacoma, Wash.; Portland, Ore.; El Paso, Tex. (and shall have lived in El Paso for six months).

²⁷ Davenport, Iowa; Ashtabula, Ohio; Spokane, Wash.; Pueblo, Col.; Seattle, Wash.; Augusta, Ga.; Schenectady, N. Y.; Melrose, Mass.

²⁸ Providence, R. I.; Grand Rapids, Mich.; Oakland, Cal.; Los Angeles, Cal.; Schenectady, N. Y.; Spokane, Wash.; Seattle, Wash.

²⁹ Dallas, Tex.; Spokane, Wash.; Austin, Tex.; Joplin, Mo.; Birmingham, Ala.; Seattle, Wash.; Galveston, Tex.; Schenectady, N. Y.; Fort Worth, Tex.

³⁰ Atlantic City, N. J. (read, also); Spokane, Wash.; Joplin Mo. ("properly understand the traffic rules and ordinances of the city"); Seattle, Wash.; Schenectady, N. Y. (read and speak).

³¹ Los Angeles, Cal.; Hartford, Conn. (any "suitable" person with proper experience and character"); Harrisburg, Pa.; Atlantic City, N. J. (familiar with territorial limits and principal places); Spokane, Wash.; Birmingham, Ala.; Seattle, Wash.; Ogden City, Utah; Galveston, Tex. (thoroughly acquainted with all the streets and locations); Grand Rapids, Mich.; Portland, Ore.; Little Rock, Ark.; El Paso, Tex.

³² Los Angeles, Cal.; Seattle, Wash.; Providence, R. I.; Dallas, Tex.; Davenport, Ia.; Austin, Tex.; Pueblo, Col. (requires one year's experience); Birmingham, Ala. (must be "experienced"); Fresno, Cal.; Grand Rapids, Mich.; Portland, Ore.; Little Rock, Ark. (requires six months' experience).

³³ Spokane, Wash.; Seattle, Wash.; Schenectady, N. Y.

³⁴ Los Angeles, Cal.; Dallas, Tex.; Utica, N. Y.; Orange, N. J. (routes designated by Mayor—only two lines are operating, each making three trips daily); Davenport, Iowa; Spokane, Wash.; Austin, Tex. (must operate at least thirty blocks); Oklahoma City, Okla.; Pueblo, Col.; Fresno, Cal.; Ogden City, Utah; Fitchburg, Mass.; Syracuse, N. Y.; Tulsa, Okla.; Galveston, Tex.; Augusta, Ga.; Grand Rapids, Mich.; Portland, Ore.; Louisville, Ky.; San Antonio, Tex.; Oakland, Cal.; Pasadena, Cal.; Tacoma, Wash.; Schenectady, N. Y.; Fort Worth, Tex.; Huntington, W. Va.

³⁵ New Orleans, La.; Hartford, Conn.; Joplin, Mo.; Providence, R. I. (license granted subject to prescribing of route).

³⁶ New Orleans (as announced on sign and "provided there is a passenger on said vehicle"); Los Angeles, Cal.; Dallas, Tex.; Davenport, Iowa; Spokane, Wash.; Austin, Tex.; Fresno, Cal.; Ogden City, Utah; Tulsa, Okla.; Galveston, Tex.; Portland, Ore. ("between the hours of 6 and 8 p. m. all motor buses shall be operated to outer terminus of their routes, but may turn back upon discharging the last inbound passenger, and between the hours of 4:30 and 7 p. m. all auto buses shall be operated to the inner terminus, but may turn back on discharging the last outbound passenger"). During all other hours must complete the trip); Oakland, Cal.; Spokane, Wash.; El Paso, Tex.

³⁷ Los Angeles, Cal.; Davenport, Iowa; Fresno, Cal.; Ogden City, Utah; Syracuse, N. Y.; Galveston, Tex.; Grand Rapids, Mich. (temporary change with application of superintendent of police); Portland, Ore.; San Antonio, Tex.; Pasadena, Cal.; Augusta, Ga. (licensee may change route by notifying treasurer of city); Fort Worth, Tex. (may be changed upon application by licensee).

³⁸ Los Angeles, Cal. (for more than three blocks); Spokane, Wash.; Fresno, Cal.; Tulsa, Okla.; Galveston, Tex.; Portland, Ore.; Oakland and Pasadena, Cal.

³⁹ Thus in Los Angeles they may deviate to transport passenger to and from any public demonstration or attraction, church or public school, or to designated points in the business district. In Grand Rapids they may go to the railroad station if route is within three blocks of any such station.

⁴⁰ New Orleans, La.; Hartford, Conn.; Providence, R. I.; Augusta, Ga.; Louisville, Ky. (routes only); Joplin, Mo. (fare only).

stated officer or officers. As one means of exterminating the jitney under the guise of regulating it, the routes required are sometimes so long as to be unprofitable. Transfer systems⁴¹ may be or are compulsory.

The ordinances often require that applications for licenses shall show the number of hours per day which the vehicle will be operated and the schedule for such operations,⁴² or require operation continuously between the hours designated in the license certificate.⁴³ Occasionally, however, eight hours of continuous service are required,⁴⁴ and rarely twelve,⁴⁵ or even sixteen⁴⁶ or more.⁴⁷

SAFETY PRECAUTIONS

The safety precautions included in the ordinances either require the passengers to ride on the seats only,⁴⁸ or particularly prohibit riding on doors, dashers, fenders or running boards, or the protrusion of the body outside of the car.⁴⁹ It is occasionally provided specifically that the car must be brought to a full stop before crossing steam railway tracks.⁵⁰ These provisions, of course, are all in addition to the traffic and ordinance provisions as to speed limits, speed at intersections and cutting corners.

Other safety requirements are set forth in the various ordinances. Thus tire chains are required, especially in winter and wet weather.⁵¹ It is likewise required in some cities, that the cars be equipped with non-skid tires.⁵² When cars are to be run between sunset and sunrise, the cars must be provided with lights.⁵³ Various kinds of signs are required, such as giving the route,⁵⁴ termini,⁵⁵ fare,⁵⁶ license number,⁵⁷ name of operator⁵⁸ and carrying capacity of car.⁵⁹

The provisions of these ordinances to assure a safe

vehicle run all the way from the prohibition of the use of dangerous cars⁶⁰ to requirement of inspection before use and during use, to see if running gear, brakes, chassis, wheels, etc., are safe.⁶¹ Some ordinances specify the intervals at which such inspection shall be made.⁶² General requirements are that cars shall be sanitary,⁶³ while Portland, Ore., requires that they be cleaned and fumigated at stated intervals.

RECEIVING AND DISCHARGING PASSENGERS

A number of ordinances specifically state that the motor vehicle must, in receiving and discharging passengers, draw up at the right-hand curb.⁶⁴ Requirements are also included that these vehicles must stop for this purpose at least 25 ft.,⁶⁵ 50 ft.,⁶⁶ 60 ft.⁶⁷ and 75 ft.⁶⁸ respectively from the near side of the intersecting street. Other cities specify distances of 10 ft.⁶⁹ and 20 ft.⁷⁰

It is further specified, though rarely, that the vehicle must come as near to the curb as possible,⁷¹ or come within 2 ft. of the curb.⁷² One city, Pueblo, Col., requires that the bus stop in the middle of the block.

RESTRICTIONS AS TO OVERCROWDING

The ordinances of some cities restrict the number of passengers that can be carried to two, including the driver, in excess of the manufacturer's rating as to the capacity of the car.⁷³ In most of these cases children under seven years of age are excepted. One city, Oakland, Cal., allows one passenger in excess of the seating capacity. In many other ordinances the number of passengers that the car may hold is restricted to the number stipulated in the manufacturer's statement as to the car's capacity.⁷⁴ In these cases children under the age of five years are excepted. In the majority of cities where jitney ordinances are in operation it is specifically stated that but one person may ride with the chauffeur.⁷⁵

OTHER POLICE REGULATIONS

A sign stating that the car is filled, visible at a distance of 100 ft., is required in Fresno, Cal. The number plate is to be displayed conspicuously in Utica,

⁴¹ Syracuse, N. Y.

⁴² Austin, Tex.; Oklahoma City, Okla.; Pueblo, Col.; Fitchburg, Mass.; Syracuse, N. Y.; Galveston, Tex.; Pasadena, Cal.; Tacoma, Wash.; Utica, N. Y.; San Antonio, Tex.

⁴³ Dallas, Tex. (except Sundays and in case of illness, accidents, etc.).

⁴⁴ Spokane, Wash. (each day of the year); Grand Rapids, Mich. (6 to 10 a. m.; 12 noon to 2 p. m.; and 5 to 8 p. m., with but one-half of buses on any route on Sunday); El Paso, Tex.

⁴⁵ Austin, Tex. (twelve hours consecutively, Sundays excepted, with reasonable time for meals and due allowance for delays and interruptions); Portland, Ore. (6 to 10 a. m. and 3 to 11 p. m., except in case of unavoidable accidents; 7.30 a. m. on Sundays); Fort Worth, Tex. (for twelve consecutive hours except Sunday).

⁴⁶ Davenport, Iowa; Fresno, Cal. (from 6 a. m. to 10 p. m.); Tulsa, Okla.; Schenectady, N. Y. (for six days per week).

⁴⁷ Ogden City, Utah (6.30 a. m. until midnight on a "regular schedule").

⁴⁸ Atlantic City, N. J.; Davenport, Iowa; Augusta, Ga.; Duluth, Minn.

⁴⁹ Ashtabula, Ohio; Dallas, Tex.; Utica, N. Y.; Harrisburg, Pa. (no ordinance); Hartford, Conn.; New Orleans, La.; Austin, Tex.; Oklahoma City, Okla.; Syracuse, N. Y.; Birmingham, Ala.; Portland, Ore.; San Antonio, Tex.; Tulsa, Okla.; Galveston, Tex.; Spokane, Wash.; Louisville, Ky.; Grand Rapids, Mich.; Providence, R. I.; Fresno, Cal.; Tacoma, Wash.; Pasadena, Cal.; Oakland, Cal.; Fort Worth, Tex.; Reading, Pa.; El Paso, Tex.

Policemen and firemen are excepted from the operation of these provisions by a number of these cities.

⁵⁰ Duluth, Minn. (stop at least 30 ft. from track); Joplin, Mo.; Grand Rapids, Mich.; Ogden City, Utah (electric cars or otherwise); Portland, Ore. (applies only to vehicles with capacity of more than fourteen passengers); Oakland, Cal. (except that orders of flagmen must be obeyed).

⁵¹ Los Angeles, Cal.; Joplin, Mo.; Pueblo, Col.; Ogden City, Utah; Providence, R. I.; Oakland, Cal.

⁵² Los Angeles, Cal.; Dallas, Tex.; Ogden City, Utah.

⁵³ Davenport, Iowa; Utica, N. Y.; New Orleans, La.; Joplin, Mo.; Oklahoma City, Okla.; Syracuse, N. Y.; Portland, Ore.; San Antonio, Tex.; Tulsa, Okla.; Dallas, Tex.; Galveston, Tex.; Spokane, Wash.; Grand Rapids, Mich.; Fitchburg, Mass.; Ogden City, Utah; Tacoma, Wash.; Pasadena, Cal.; Fort Worth, Tex.

⁵⁴ Utica, N. Y.; Los Angeles, Cal.; Augusta, Ga.; Oklahoma City, Okla.; Syracuse, N. Y.; Portland, Ore.; Dallas, Tex.; San Antonio, Tex.; Davenport, Iowa; Tulsa, Okla.; Galveston, Tex.; Spokane, Wash. (signs to be hung on both sides of car); Louisville, Ky.; Grand Rapids, Mich.; Ogden City, Utah; Providence, R. I.; Shreveport, La.; Tacoma, Wash.; Oakland, Cal.; El Paso, Tex.

⁵⁵ Los Angeles, Cal.; Augusta, Ga.; Joplin, Mo.; Austin, Tex.; Oklahoma City, Okla.; Dallas, Tex.; San Antonio, Tex.; Tulsa, Okla.; Galveston, Tex.; Louisville, Ky.; Grand Rapids, Mich.; Ogden City, Utah; Oakland, Cal.; Little Rock, Ark.; El Paso, Tex.

⁵⁶ Los Angeles, Cal.; Augusta, Ga.; Joplin, Mo.; San Antonio, Tex.; Grand Rapids, Mich.; Ogden City, Utah; Providence, R. I.; Shreveport, La.; Tacoma, Wash.; Oakland, Cal.; Little Rock, Ark.

⁵⁷ Hartford, Conn.; Los Angeles, Cal.; Austin, Tex.; Portland, Ore.; Atlantic City, N. J.; San Antonio, Tex. (copy of license to be displayed); Tulsa, Okla.; Galveston, Tex.; Spokane, Wash. (both sides of car); Pueblo, Col.; Louisville, Ky.; Grand Rapids, Mich.; Fitchburg, Mass.; Ogden City, Utah; Providence, R. I.; Fresno, Cal.; Shreveport, La.; Long Beach, Cal. (permit number also); Tacoma, Wash.; Pasadena, Cal.; Schenectady, N. Y.; Little Rock, Ark.; Davenport, Iowa.

⁵⁸ Austin, Tex.; Oklahoma City, Okla.; Tulsa, Okla.; Louisville, Ky.

⁵⁹ Grand Rapids, Mich. (sign front and rear—to be illuminated after dark).

⁶⁰ New Orleans ("no vehicle which is dilapidated, worn, or in other ways dangerous to passengers may be used").

⁶¹ Atlantic City, N. J.; Seattle, Wash.; Little Rock, Ark.; Augusta, Ga.

⁶² In Portland, Ore., and Providence, R. I., cars must be inspected at least once in thirty days, and in Dallas, Tex., once each week; El Paso, Tex., every two weeks.

⁶³ Augusta, Ga.; Joplin, Mo.; Little Rock, Ark.

⁶⁴ Harrisburg, Pa.; Hartford, Conn.; New Orleans, La.; Los Angeles, Cal.; Joplin, Mo.; Austin, Tex.; Grand Rapids, Mich.; Tacoma, Wash.; Utica, N. Y. (on streets with car service); El Paso, Tex.

⁶⁵ Birmingham, Ala.; Atlantic City, N. J.; Fitchburg, Mass.

⁶⁶ Hartford, Conn.; New Orleans, La.; Los Angeles, Cal. (75 ft. of a street railway on the street); Dallas, Tex. (not nearer than 50 ft. or farther than 100 ft. from intersection); San Antonio, Tex.; Duluth, Minn.; Providence, R. I. (not within 25 ft. of place designated by white post or in manner prescribed for receiving and discharging street railway passengers).

⁶⁷ Spokane, Wash.

⁶⁸ Harrisburg, Pa.; Tacoma, Wash.; Reading, Pa.

⁶⁹ Fitchburg, Mass. (not within 10 ft. of white pole designated for a street-car stopping place or 25 ft. of intersection of streets).

⁷⁰ Ogden City, Utah (not within 20 ft. of crossing).

⁷¹ Oakland, Cal.; Ashtabula, Ohio.

⁷² Fresno, Cal.; Shreveport, La.

⁷³ Ashtabula, Ohio (applies to standard touring cars or limousines); Spokane, Wash.; Hartford, Conn.; Fort Smith, Ark.; Fitchburg, Mass.; Fresno, Cal.; Long Beach, Cal.

⁷⁴ Ashtabula, Ohio (applies to all cars except standard touring cars and limousines); Duluth, Minn.; Davenport, Iowa; New Orleans, La.; Portland, Ore.; Atlantic City, N. J.; Dallas, Tex.; Grand Rapids, Mich.; Providence, R. I. (except children under seven years of age); Taunton, Mass.; Tacoma, Wash.; Schenectady, N. Y.; Little Rock, Ark.; El Paso, Tex.; Melrose, Mass.

⁷⁵ Duluth, Minn.; Davenport, Ia.; Reading, Pa.; Harrisburg, Pa.; Hartford, Conn.; Los Angeles, Cal.; Joplin, Mo. (no person ahead of front seat); Austin, Tex. (unless seat is designed to accommodate more than one passenger); Portland, Ore.; Dallas, Tex.; San Antonio, Tex. (with child in arms); Pueblo, Col.; and Fitchburg, Mass. (same as San Antonio); Ogden City, Utah; Providence, R. I. (no passenger with child in arms); Shreveport, La.

N. Y. The words "jitney bus"⁷⁶ or "motor bus"⁷⁷ must be attached or painted on the car in some cities. Dallas, Tex., requires that a safety certificate be hung in the car. New Orleans, La., requires that the name of the corporation owning or operating the car be displayed in the car.

Some ordinances make stipulations as to where cars shall stand and as to the length of time they shall stand.⁷⁸ Special provisions are made in some cities as to cars running on streets on which street railways are in operation.⁷⁹ Salem, Mass., requires that two means of exit must be provided for cars with a carrying capacity of more than eight persons. Some ordinances specifically state that no advertising shall be allowed.⁸⁰ San Antonio, Tex., requires that no umbrella shall be raised by any person occupying the front seat.

PENALTIES

The penalties for violation of the ordinances are usually expressed in terms of fine or imprisonment or both, the maximum period of imprisonment ranging

from thirty to ninety days.⁸¹ The fines are limited as follows: to not more than \$25,⁸² \$50,⁸³ \$100,⁸⁴ \$200,⁸⁵ \$300⁸⁶ and \$500.⁸⁷ It is usually provided that licenses may be revoked upon conviction or violation thereof or of the ordinance on traffic regulations. Dallas, Tex., provides that when so revoked a license may not be reissued within six months. Galveston, Tex., and Ashtabula, Ohio, automatically revoke licenses on the second and third convictions respectively.

Traffic Notes from Hampton, Va.

Following the Consolidation of Five Companies the Combined Properties Were Rehabilitated—Schedule, Publicity and Fare Systems

On Jan. 12, 1912, Allen & Peck, Inc., took over the following five companies: Newport News & Old Point Railway & Electric Company, Citizens Railway, Light & Power Company, Newport News Gas Company, Hampton Roads Traction Company, Hampton, Phoebus & Fort Monroe Gas Corporation. On Jan. 1, 1914, these utilities were merged as the Newport News & Hampton Railway, Gas & Electric Company. In addition to the activities named in the title of the company, it conducts ice manufacture with retail distribution. Since the present operating company took charge of these properties, with J. N. Shannahan as general manager, it has spent about \$600,000 for rehabilitation.

Briefly stated the main improvements comprised the following:

Re-equipment of the power house, except for the boilers and one vertical turbine (the latter now used only for peak loads), without serious interruption of the traction and lighting service, although no other source of energy supply was available.

Reconstruction of the pole lines for 11,000-volt transmission and 3450-volt lighting.

Modernization of the lighting system by the installation of luminous arcs, nitrogen-filled lamps and tungsten lamps.

Construction of a gas holder at Newport News and installation of a high-pressure main from the Newport News plant to Hampton, the Hampton low-pressure plant being discontinued.

⁷⁶ Atlantic City, N. J. (words must be on rear part of car, not less than 8 in. in length and 24 in. wide).

⁷⁷ Dallas, Tex. (words to be painted on rear of car in letters not less than 6 in. high).

⁷⁸ Utica, N. Y.; Providence, R. I.; Little Rock, Ark.

⁷⁹ In Oklahoma City, Okla., cars are not allowed to run longitudinally on streets on which street railways are in operation, except within fire limits of city. They may operate for more than two blocks in one direction where necessary in crossing fire limits. Tulsa, Okla., requires that cars shall not run longitudinally on streets having street railways.

⁸⁰ Augusta, Ga.; Grand Rapids, Mich.; Providence, R. I.; Shreveport, La.

⁸¹ Los Angeles, Cal., however, provides a maximum imprisonment of six months.

⁸² New Orleans, La. (not less than \$10 or more than \$25); Ocean City, N. J. (or thirty days' imprisonment in default of fine); Fort Smith, Ark. (not less than \$5 or more than \$15); Little Rock, Ark. (not less than \$5).

⁸³ Huntington, W. Va. (not less than \$10 or more than \$50); Atlantic City, N. J. (or not to exceed ten days in jail); Ashtabula, Ohio; Providence, R. I.; Fitchburg, Mass. (\$20); Louisville, Ky. (not less than \$10).

⁸⁴ Hartford, Conn. (fine only); Lansing, Mich. (or imprisonment until fine is paid, not in excess of thirty days); Utica, N. Y.; Davenport, Iowa (or thirty days in jail); Duluth, Minn. (or sixty days in jail); Spokane, Wash.; Oklahoma City, Okla.; Seattle, Wash.; Syracuse, N. Y.; Tulsa, Okla.; Galveston, Tex.; Grand Rapids, Mich.; Shreveport, La. (not less than \$5); Long Beach, Cal.; Portland, Ore.; Salem, Mass.; Oakland, Cal.; Pasadena, Cal.; Tacoma, Wash.; Memphis, Tenn. (not less than \$50—a state law).

⁸⁵ Schenectady, N. Y. (not more than \$150); Austin, Tex.; San Antonio, Tex.; Fort Worth, Tex.; El Paso, Tex.

⁸⁶ Denver, Col. (not less than \$100 or imprisonment of ninety days or both); Joplin, Mo.; Fresno, Cal.; Pueblo, Col.

⁸⁷ Los Angeles, Cal.; Dallas, Tex. (not less than \$5).

HAMPTON TRAFFIC NOTES—CAR REBUILT FOR POSSIBLE ONE-MAN OPERATION

HAMPTON TRAFFIC NOTES—STANDARD DOUBLE-TRUCK CAR WITH SMOKING COMPARTMENT

Replacement of worn special work. Rehabilitation of all rolling stock, part being rebuilt from the sills up. In repainting the cars, their color was changed from dark yellow to Sherwin-Williams light body color traction green, partly because this color was considered an improvement and partly to make the public realize the betterments which the company was effecting in the service as a whole.

Purchase of four Brill arch-roof semi-convertible cars fitted with smoking compartment and carrying four 203-H tap-field motors with K-49-A controllers. Further purchase of eight single-truck second-hand cars each equipped with two GE-1000 motors.

Lately the management has looked into the possibility of one-man cars for certain feeder lines. One of its eight single-truck cars has already been rebuilt for longer platforms (from 3½ ft. to 4½ ft.). A locking arrangement also has been provided for the rear folding doors on the right-hand side of each vestibule. The convenient control handle for these doors and the simple leverage for the same are shown in the accompanying illustration of the rebuilt vestibule.

The following paragraphs will give some details of the railway service which is now being conducted by this company.

SERVICE AND PUBLICITY FOR IT

On a system of this character where shorter headways than fifteen to thirty minutes are uneconomical, the maximum traffic can be obtained only by keeping resident and visitor alike fully acquainted with the schedules. This end is achieved in several ways. One way is to print the schedule of all lines on a card which is then distributed for display in all hotels, important stores and waiting rooms. A second way is to paint on a bulletin board a schedule of cars passing a certain prominent corner, such as the sign reproduced which is installed at the northeast corner of King and Queen

HAMPTON TRAFFIC NOTES—BULLETIN BOARD ON A STREET CORNER IN HAMPTON

Streets, Hampton. A third and still simpler way is to erect a signboard at outlying stops to show at what minutes past the hour the cars for given directions are to be expected. The company also issues a pocket booklet with detailed time-tables of all lines, including ferry connections to Norfolk. The cost of this booklet is defrayed by advertising revenue from local merchants and banks.

The popularity of Old Point Comfort and vicinity as a pleasure resort the year round is a matter of national knowledge. For its transient patrons the company issues a finely-illustrated folder with map, the descriptions in the folder being placed in the order in which a rider starting from Old Point would see the places described. To aid the passenger still further, the same number which distinguishes each place in the text is repeated on the map. The summer schedule calls for such short headways that this folder is printed without a time-table.

The 10-mile run between Old Point Comfort, Phoebus, Hampton and Newport News is made in 45 minutes. In the towns the speed may be as low as 6 m.p.h. because of ordinances, while it is as high as 30 m.p.h. on the intermediate right-of-way. Cars are despatched by telephone. U. S. block signals are standard.

FARES

The distance between Old Point Comfort and Newport News is 10 miles. This run is divided into three zones at 5 cents each. Under a franchise provision, workmen's tickets good between the hours of 5 and 7, both morning and evening, are sold in books at half price. Half fare is also granted to children going to and from school.

Aside from these half-rate fares the company is also obligated to sell six tickets for 25 cents for use in Newport News only. In summer a voluntary reduction is made in the form of a 20-cent round trip between Newport News and Buckroe Beach, valid between mid-day and midnight. The going ticket is sold on the car by the conductor, and includes a stub which is exchanged within the Beach limits for a return coupon. The ordinary fare for this trip is 30 cents. Owing to the varieties of fares and the use of zones, the Ohmer register is employed.

Aside from individual excursion tickets, the company handles entire groups for pleasure trips in chartered cars or for tickets sold at 20 cents per person and valid all day. In such cases, the organization which conducts the excursion receives 10 per cent of the fares collected. Sometimes these trips take the form of night trolley rides, with music, to Buckroe Beach.

NEWPORT NEWS & HAMPTON RAILWAY, GAS & ELECTRIC CO.	
WINTER SCHEDULE—EFFECTIVE SEPT. 15, 1914	
Between	Newport News, Hampton, Phoebus and Old Point Via MAIN LINE Every 30 Minutes
Leave	Shipyard and Old Point 8 and 35 minutes past the Hour
Leave	Shipyard and Old Point 11:05 P. M. Leave Old Point 11:05 and via Boulevard 11:35 P. M.
Between	N. News, Boulevard, Hampton, Phoebus and Old Point Via BOULEVARD Every 30 Mins.
Leave	28th St. & Washington Ave. 18 and 45 minutes past the Hour. Leave Old Point 30 and 50 minutes past the Hour
Leave	Shipyard 28th St. & Wash. Ave. 11:45 P. M. for Station Only. Last Car Leaves Old Pt. 11:55 P. M. Through to N. News. Last Car Through to Old Pt. Leaves 12:15 P. M.
Between	NORTH END and C. & O. DEPOT, WASHINGTON AVE. LINE Every 15 Minutes
Leave	55th St. 10, 25, 40 and 55 minutes past the Hour. Leave C. & O. Depot 12, 27, 42 and 57 mins. past the Hour
Leave	28th St. and Washington Ave. 15, 30 and 45 minutes past the Hour. Westbound 5, 20, 35 and 50 minutes past the Hour
Leave	6 A. M. until 11:45 P. M. Main Line Car Leaves North End 12 o'clock Night
Between	SHIPYARD and CITY LIMITS, Via Main Line Every 30 Minutes
Leave	Shipyard 20 and 50 mins. past the Hour. Leave Chestnut Ave. and 28th St. 4 and 34 mins. past the Hour
Between	28th St. and WASHINGTON AVE. 31st and CHESTNUT AVE. Via 23rd St. Every 30 Minutes
Leave	28th and Washington Ave. 3 and 33 minutes past the Hour. Leave 31st and Chestnut Ave. 18 and 48 minutes past the Hour
Between	31st, WASHINGTON AVE. and JAMESTOWN HOTEL Via Ivy Ave. Every 30 Minutes
Leave	31st St. 5 and 35 minutes past the Hour. Leave Jamestown Hotel, Ivy Ave. 20 and 50 minutes past the Hour
Between	NEWPORT NEWS & NORFOLK Every Hour & 15 Mins. Via Double End FERRY
Leave	Shipyard 5:30 A. M., 6:45, 8:00, 9:15, 10:30, 11:45, 1:00, 2:15, 3:30, 4:45, 6:00, 7:15, 8:30, 28th St. 10:48, operating out 27th and in 28th St. except 10:48 P. M. trip which leaves 28th St. and Washington Ave. via 23rd Street
Between	NORFOLK & HAMPTON Via Hampton Bridge 5:40 A. M., 6:50, 8:05, 9:20, 10:35, 11:50, 1:05 P. M., 2:20, 3:35, 4:50, 6:05, 7:20, 8:35, 10:40
Between	KING and QUEEN STREETS and WOOD'S CORNER, East Hampton Every 30 Minutes—Leave King and Queen Sts. 26 and 56 minutes past the Hour. Leave Wood's Corner 12 and 42 mins. past the Hour. 5:50 A. M. until 11:30 P. M. Last Car Leaves Wood's Corner 11:30 P. M.
Between	BUCKROE BEACH & SOLDIERS' HOME Through Phoebus Every 30 Minutes—Leave Buckroe Beach 5 and 35 minutes past the Hour
Leave	5:30 A. M. to 10:30 P. M. Leave Soldiers' Home 12 and 47 mins. past the Hour. Leave Harbor Corner for Soldiers' Home 8:15 minutes past the Hour
Leave	Old Point 10:48 P. M. Shipyard 11:45 P. M. 12:15 P. M. 12:45 P. M. 1:15 P. M. 1:45 P. M. 2:15 P. M. 2:45 P. M. 3:15 P. M. 3:45 P. M. 4:15 P. M. 4:45 P. M. 5:15 P. M. 5:45 P. M. 6:15 P. ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

The Nominating Committee of the Engineering Association Reports Names of Candidates for Office—Convention Committees of the Manufacturers' Association—"White Special" Folder Issued—Accountants' Association Educational Courses

ENGINEERING ASSOCIATION NOMINATIONS

The committee on nominations has reported the following list of names of its candidates for offices and membership in the executive committee: President, John Lindall, Boston Elevated Railway; first vice-president, F. R. Phillips, Pittsburgh Railways; second vice-president, G. W. Palmer, Jr., Bay State Street Railway; third vice-president, W. G. Gove, Brooklyn Rapid Transit System, and secretary-treasurer, E. B. Burritt, New York, N. Y.

Executive committee (in addition to the above): E. R. Hill, Pennsylvania Railroad; C. S. Kimball, Washington Railway & Electric Company; C. L. Cadle, New York State Railways, and C. F. Bedwell, Public Service Railway.

MANUFACTURERS' ASSOCIATION COMMITTEE APPOINTMENTS

Vice-President F. A. Elmquist of the Manufacturers' Association, in charge of finance, has announced the appointment of C. P. Billings, Westinghouse Traction Brake Company, Pittsburgh, Pa., as chairman of the finance committee for the San Francisco convention.

LOBBY WHERE SECRETARY'S OFFICE AND REGISTRATION DESKS WILL BE LOCATED, IN HALL OF THE NATIVE SONS OF THE GOLDEN WEST

The appointment of the following committees has also just been announced:

Local Transportation Committee—A. G. Jones, General Electric Company, chairman; G. H. Barker, Standard Motor Truck Company; W. P. Bell, Standard Underground Cable Company; S. M. Gilman, John A. Roebling's Sons Company; G. R. Murphy, Electric Storage Battery Company, and F. W. Webster, Allis-Chalmers Manufacturing Company.

Entertainment—(Under the direction of Thomas Finigan, vice-president, vice-president Pierson, Roeding & Company, San Francisco, Cal.); A. V. Thompson, General Electric Company, San Francisco, Cal., chairman; W. E. Amann, Galena-Signal Oil Company; C. F. Bulotti, Ec-

cles & Smith Company; Richard R. Carr, The Lorain Steel Company; H. S. Clark, Westinghouse Traction Brake Company; H. B. Green, Pennsylvania Steel Company; R. A. Holabird, Ohio Brass Company; F. L. Jones, General Railway Signal Company; H. R. Noack, Pierson, Roeding & Company; J. H. Steiger, American Brake Shoe & Foundry Company, and J. B. Struble, Union Switch & Signal Company.

Press and Publicity Bureau—N. A. Bowers, *ELECTRIC RAILWAY JOURNAL*, chairman; A. H. Halloran, *Journal of Electricity, Power & Gas*.

Hotel and Registration—C. E. Heise, Westinghouse Electric & Manufacturing Company, chairman; R. F. Behan, Westinghouse Electric & Manufacturing Company; H. A. Beuter, Baldwin Locomotive Works; E. F. Bodler, Tool Steel Gear & Pinion Company; E. C. Myers, General Electric Company; F. A. Richards, The J. G. Brill Company; S. P. Russell, H. W. Johns-Manville Company, and E. Sullivan, Pantasote Company.

Information Bureau—W. P. L'Hommedieu, Westinghouse Electric & Manufacturing Company, chairman; Stuart Hazelwood, Midvale Steel Company; G. Koch, St. Louis Car Company; S. H. Lanyon, Federal Signal Company; F. H. Leggett, Western Electric Company; W. P. Millner, Dearborn Chemical Company; C. H. Pennoyer, National Conduit & Cable Company, and O. W. Wollcott, Sherwin-Williams Company.

THE "WHITE SPECIAL"

Complete information concerning the transportation arrangements made by the Chicago transportation committee for the "White Special" train from Chicago to San Francisco is given in a folder, appropriately inclosed in attractive white covers, distributed this week from the office of H. G. McConaughy, director of transportation. This train is in charge of L. E. Gould, *ELECTRIC RAILWAY JOURNAL*, Old Colony Building, Chicago, Ill., who will furnish additional information, and reserve space and tickets.

The train will leave the Grand Central Depot, Harrison Street and Fifth Avenue, Chicago, via the Chicago Great Western Railroad, at 6.30 p. m., Friday, Oct. 1. At Omaha passengers from St. Louis, Kansas City, St. Paul and Minneapolis will join the train, which will leave at 8.30 a. m. on Saturday. Cheyenne, Wyo., will be reached at 8.30 p. m. on the same day. The train will arrive at San Francisco at 10.25 o'clock on Monday morning. The train will be a counterpart of the "Overland Limited." Tourists on the "White Special" can return on the "Blue Special" or "Red Special," or individually.

ACCOUNTANTS' ASSOCIATION EDUCATIONAL COURSES

As an outgrowth of the course administered last season by Prof. John R. Wildman under the auspices of the educational committee of the Accountants' Association, three courses have been planned for the coming year. These are as follows: Elementary course, course in general theory and practice of accounts, and course in advanced accounting. The third course will be taken by the students who followed the course begun in 1914.

The subjects to be taken up in the elementary course are: Qualities essential to efficient office work; business English; mathematics of business; office practice—care of correspondence, filing, forms, functions, method of preparing and handling invoices, checks, vouchers, notes, etc.; principles of double-entry bookkeeping, with illustrations from the street railway field; practice in double-entry bookkeeping, with material from the street railway field; major and minor reports of the accounting department—why and how made up, and the use to which they are put; brief history of Interstate Commerce Commission, its relation (as well as the relations of various State commissions) to the street railway companies, the scheme of the classification, explanation of accounts, etc.

The topics to be followed in the course on general theory and practice of accounts are as follows: The purpose and scope of accounting; the relation of accounting to allied subjects, such as economics, law, finance and organization; the methods of keeping books and the media for recording financial transactions; accounts—their philosophy, construction and classification; discussion of balance sheet accounts; discussion of revenue and expense accounts; preparation, interpretation and use of balance sheets, income statements, etc.; graphs, charts and statistics as aids to operation and management.

In advanced accounting the following subjects will be covered: Organization and development; operation; merger; consolidation; holding companies; receivership; reorganization; dissolution.

In a pamphlet just issued by the committee, a number of testimonials expressing satisfaction with the first-year course are printed.

COMMUNICATION

Girder and High T-Rail Renewals

UNITED RAILROADS OF SAN FRANCISCO
SAN FRANCISCO, CAL., Aug. 11, 1915.

To the Editors:

I have read the article in the *ELECTRIC RAILWAY JOURNAL* of July 31 regarding rail renewals, and I want to make the following comments:

Flange Bearing.—In proper rail sections it is not necessary to renew as soon as the wheel flange rides or touches the floor of the groove or tram. We have rail in service where the groove has been cut through. It had to be removed from the street two years ago, although still good for a year or more. This condition applies only in asphalt and concrete paved streets, otherwise the head of the rail would bend over and break off.

Corrosion.—The statement made that corrosion advances more rapidly where the track drainage is good, as on steep grades, is rather novel. This, if true, would seem to indicate that poor drainage is an advantage and, therefore, draining track is a useless expenditure. Personally, I believe that the drier the track can be kept the longer the rail will last, so far as corrosion is concerned. Wherever we have had bad cases of corrosion of the web and base of the rail, the track was located in poorly-drained flat-grade streets. Electrolytic action takes place more readily, also, where the drainage is poor, and where the rail, therefore, is constantly in damp, moist ground.

Corrugation.—Our experience does not lead us to believe that titanium prevents or delays corrugation, but it might lengthen the life of the rail because the metal is practically free from impurities. This has not yet been demonstrated on our property as we have only used titanium for four years. A comparison of titanium-

treated rail and untreated is shown in the following table:

REPORT ON CORRUGATED RAILS IN STANDARD TRACK CONSTRUCTION

Lorain steel 106-422 rail on ties spaced 2-ft. centers with 9 in. of rock ballast and asphalt or basalt block paving. All rails open-hearth steel with or without titanium. All corrugations where noted are just starting or have developed sufficiently to be quite noticeable, but are not yet bad.

1912			

Welded and Riveted Joints.—I do not agree that welded and riveted joints have had a tendency to reduce joint difficulties. I think this statement is too optimistic. For a certain time after installation it would appear that such was the case. After a few years, however, when the steel adjacent to the joint begins to break on account of the great heat applied when the joints were installed, the trouble and expense of keeping these in good condition is far more than that of the standard plate joint. Riveted joints cannot be made perfectly tight on account of the shrinkage of the rivets when cold. Furthermore, after they loosen they cannot be tightened without cutting them off and reriveting.

B. P. LEGARE,

Engineer Maintenance of Way and Construction.

Train Resistance of Electric Cars

On page 239 of the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 7 a pair of resistance curves, Fig. 3, was inadvertently included with two energy consumption curves plotted from Third Avenue (New York) Railway tests. They were also referred to editorially as from Third Avenue Railway tests in the issue for Aug. 14. These curves were intended to represent heavy railroad conditions and had no relation to the Third Avenue Railway tests.

A bit of freight business of which the Louisville & Interurban Railway is sure, is represented by water from two locally famous springs near LaGrange, Ky., which is bottled by two concerns in Louisville. Shipments have been made daily from each of the springs in galvanized drums and taken from the interurban depot by the wagons of the bottling company. The Merchants' Ice & Refrigerating Company, which recently acquired the bottling rights of one of the springs, is planning to haul the water in carload lots, storing it until it is bottled. The water is used for carbonating, as well as for other purposes, and the volume of this business is increasing. In carload lots the water might be delivered to the merchants' plant.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Los Angeles Commutator Slotter

BY E. L. STEPHENS, MASTER MECHANIC LOS ANGELES
(CAL.) RAILWAY

The advantage of slotting commutators has been so fully recognized that the practice has almost become universal, as nearly every company has in some way or other endeavored to develop some means whereby this slotting can be done in the most satisfactory and economical manner. Our idea was to develop something simple and efficient for a small outlay and we have finally developed a slotter which combines accessibility and ease of operation for a wide range of motors.

Fig. 1 shows an end view of the machine with the saw swung clear of the centers. In this position it receives the armature which is conveyed by chain block from a truck to the centers. The wrought-iron yoke which carries the centers for the armature shaft and machine proper is now swung into position, bringing the saw in line with the center of the commutator. The centers are then tightened on the end of the armature shaft, making the whole rigid.

Fig. 2 is a three-quarter view of the slotter with the armature in place and the machine in operation.

Fig. 3 is a general view of the machine, of the stand and of the air hose, which is used to keep the commutator clean and free from mica dust. The working parts, in this instance, were constructed mostly of wrought iron with brass bushings for the saw spindle. This is driven by a $\frac{1}{4}$ -in. round belt on a grooved pulley at about 1500 r.p.m. We use a $\frac{3}{4}$ -in. diameter circular metal saw, held in place by a nut as shown at the

COMMUTATOR SLOTTER—FIG. 2—SLOTTER AT WORK

end of the shaft. Hence the saw when worn may be easily removed and replaced by a new one.

This machine is easily adjusted to a commutator of any diameter, by using a hand screw, as shown below the centering frame, which raises or lowers the saw shaft to the proper position and depth of cut, as checked by a thumb screw.

The hand wheel at the side is for adjusting the saw when segments of the commutator are not in line with its shaft center. After this adjustment has been made the workman slots the commutator by pushing the lever

COMMUTATOR SLOTTER—FIG. 1—VIEW BEFORE FRAME IS SWUNG INTO PLACE

COMMUTATOR SLOTTER—FIG. 3—THREE-QUARTER VIEW OF MACHINE WITHOUT ARMATURE

toward the armature, moving the sliding carriage which supports the saw spindle. The saw runs clockwise, facing the front of the machine (as in Fig. 3) and is driven from a countershaft overhead. With this device a Westinghouse 38-B commutator of 135 segments can be cut $3/32$ in. deep, in a minimum time of ten minutes and a maximum of twenty-five minutes, according to the hardness of the mica.

The standard or armature support is constructed of two $3/4$ -in. wrought-iron forgings held together by $1/2$ -in. rods running through $3/4$ -in. gas pipes, which makes it strong and rigid, yet light. This machine has been in use for several years, and has given perfect satisfaction, not only in reduction of time saved but in permitting better work at reduced cost.

An Unusual Feed-In Clamp

BY S. L. FOSTER, CHIEF ENGINEER UNITED RAILROADS OF SAN FRANCISCO

For the important matter of connecting the main feeder cable with the trolley wire at the span-wire support several methods, involving different devices and giving different degrees of satisfaction, have been used.

In one type the feed-in conductor is independent of the span wire and is connected to the brass trolley ear by a small iron set screw or else is attached to a separate ear by set screws.

Experience has shown that the cost of the labor and material of this method of providing the feed-in connection by a separate conductor is the highest of all. The current-carrying capacity of the copper supplementary feed-in cable fastened with set screws is uncertain originally and is not permanent, and the feed-in cable is difficult to move because the iron set screws rust in place and break off when attempts are made to loosen or tighten them.

In a second type the contact surface for transferring the current from the feed-in cable to the trolley wire is furnished by using the feed-in cable as the span wire and relying on the pressure of this feed-in span wire, bared, against an uninsulated metal feed-in-yoke, straight-line suspension body or round-top suspension body.

This type of feed-in costs less to install than the first and its parts last practically forever. The area of contact for current-carrying purposes is not great, however. Again, the contact pressure between the bare copper feed-in cable and the metal body varies with the span-wire tension and is uncertain and the conducting surfaces are liable rapidly to become tarnished and corroded by their exposure to the weather so that their conductivity is reduced.

In a third type the feed-in cable, used as the span wire, is held by a clamping or clinching arrangement and soldered in place. This soldering-in process makes a solid piece of the stranded cable, and in the alternate up-and-down motions of the span wire imparted by the passing trolley wheels the copper strands are liable to break off one after the other until the whole conductor fails. This soldering-in also proves expensive if the track centers are changed and the trolley wire has to be moved.

The cap screw in this type of feed-in yoke, located as it is under the feed-in cable and span-wire combined, is very inaccessible for rapid manipulation with a wrench in re-earring work. The current-carrying capacity of this type of soldered-in yoke is, of course, the best possible, but the failure of the feed-in cable at the sharp edges of the yoke, the inaccessibility of

the cap screw and the usual spoiling of the device when removed are points against its popularity.

In San Francisco years ago a feed-in device was designed after unfortunate experiences with those then on the market. The working drawings and sketches make plain its construction and method of use. It consists of two special grooved brass washers that inclose the feed-in cable, one above and one below, the whole affair being bolted rigidly to the common trolley ear with the usual $3/4$ -in. square-head tap bolt and spring lock washer. It has proved to have all the good features of all the other devices and some additional ones, with none of the defects of the others.

It is light in weight, cheap in price, quickly installed, inconspicuous, foolproof and everlasting. It has ample current-carrying and contact-pressure capacity. It requires no soldering, clinch tips or set screws and, as it has no sharp edges, it safeguards the stranded soft-copper feed-in cable from breakage.

It is readily and rapidly taken off for moving or for re-earring and can be used over and over again indefi-

SIDE AND END VIEWS OF FEED-IN CLAMP

CONSTRUCTION DETAILS OF FEED-IN CLAMP

nately. It has proved entirely satisfactory in more than ten years of continuous use and is standard for this company. It is so installed that an approaching wild trolley pole will drive the feed-in cable against the steel cap screw and not against the lips of the brass washer. These brass washer feed-in devices cost 15 cents each, exclusive of the short 2-in. sherardized tap bolt and sherardized spring washer, and weigh but 7 ounces. This light weight is an important point in minimizing the hammer blow of the passing trolley wheel.

Of course, by drilling one or more holes through the top washer the inclosed cable can be soldered into this feed-in device, if this is considered desirable.

Vacuum Cleaning Cars

BY E. J. HAINES, ASSISTANT TO SUPERINTENDENT OF EQUIPMENT, BAY STATE STREET RAILWAY, BOSTON, MASS.

On a system where there are more than two or three carhouses the number of cars at each station might not warrant the installation of a vacuum cleaning plant at each one of these stations. In order to overcome this difficulty on the Bay State Street Railway, where there are thirty-seven operating carhouses scattered over a large territory, the vacuum cleaning plants are installed on cars, four of which are in service, one for each general division. This arrangement admits of the use of apparatus of larger capacity and greater efficiency for the same investment than would be possible with a plant at each station.

The vacuum cleaning cars were formerly single-truck box cars used in passenger service, having 20-ft. car bodies and longitudinal seats. All seats and seat backs were removed, cables were placed in troughs and the insides of the cars were sheathed up to the windows. The 4-in. axles of the Peckham single trucks under the cars were replaced with others $4\frac{3}{4}$ in. in diameter, and new journal boxes and heavier springs were installed.

The vacuum cleaning apparatus was then installed, great care being taken to properly distribute the weight. In addition to the vacuum cleaner a 50-cu. ft. air compressor was installed in each car for the compressed-air supply in carhouses not having compressors.

Two different types of vacuum cleaners are used. The first consists of a four-sweeper, horizontal motor-driven, vacuum pump, with a cylinder of 14 in. diameter and 10 in. stroke, operating at approximately 150 r.p.m. The motor is of 20-hp. capacity, 550-volt, type CQ, compound wound, and drives the pump by means of a beveled steel chain, covered with a continuous strip of rawhide. There are two separators, each 24 in. in diameter by 48 in. long, one wet and one dry, which deposit the dirt at points for convenient handling in the most efficient manner. The tools used are four cushion renovators, four special cushion-edge renovators, four long bristle brushes for cleaning flat woodwork and ceilings of cars, four special renovators for cleaning grooves in molding, etc., four special renovators for cleaning heaters and four extension handles. There are 200 ft. of 1-in. or $1\frac{1}{2}$ -in. special wire reinforced vacuum hose in four 50-ft. lengths. This hose is supported on hangers bracketed on the body posts when not in use.

Boxes with hinged covers are installed under the windows for the storing of tools and a large closet is built at one end of each car, the air compressor and switchboard being located at the other end.

VIEW OF HORIZONTAL TYPE VACUUM CLEANER AND HOSE

EXTERIOR OF VACUUM CLEANING CAR

The other vacuum cleaner is of the turbine type, four-sweeper, direct-connected to a vertical shunt-wound motor of 10 hp. capacity. There is a primary separating tank of 30 in. diameter and a secondary separator of 36 in. diameter with 14-in. bags for separating the fine dust. These dirt bags are so arranged that they can be taken out and emptied after each day's run. Two hundred feet of hose and renovators similar to those in the other equipment are used.

Each one of these vacuum cleaners has some advantages and some disadvantages, so that the selection of either would depend a great deal on the service demanded. The turbine cleaner has the advantage of being lighter and the current consumed is in proportion to the work done, while with the horizontal type the greatest efficiency is obtained with all sweepers in operation. Both 1-in. and $1\frac{1}{2}$ -in. hose has been used. The smaller is easier to handle but it clogs up more easily, and as there is a great deal of rubbish, such as peanut shells, etc., to be cleaned up at times, it is a distinct advantage to have the larger hose.

One man is assigned to stay with each car in charge of the apparatus. He is assisted at the various carhouses by one or more car cleaners. Two men can in a day thoroughly clean fourteen box cars with longitudinal seats and plush cushions, and more of the semi-convertible cars with cane seats.

Hydraulic Wheel and Armature Presses

BY "VULCAN," A.M.I.C.E., A.M.I.E.E., ENGLAND

To give very heavy pressure the ram of a hydraulic wheel press must of necessity move very slowly. With the ordinary type of machine having only one belt-driven, constant-speed pump plunger the traveling speed of the ram is practically the same whether the latter is exerting a light or a heavy pressure.

In forcing axles into or out of car wheels the hydraulic ram often has a considerable amount of idle travel before reaching the object to be forced; in fact, on many jobs this idle travel almost equals, and on certain work considerably exceeds, the load travel, i.e., the distance moved under appreciable pressure. The time wasted on the idle movement is proportionately very high, and various arrangements have therefore been devised with the object of increasing the ram speed at this period.

With this object in view some makers provide the hydraulic press with two pump plungers of different diameters, power-driven from the same crankshaft, the larger one or both together being for use on the idle movement of the ram and the smaller one for providing the greater ram pressures required when the work is reached.

Others have used a single pump plunger driven from a two-speed countershaft, and in this case the high speed is employed for small ram pressures, and the low speed when the loading is great.

Such methods have been more or less successful, but the following device, which has been adopted by the writer on presses having only one pump plunger, meets all requirements in the simplest possible manner, and obviates the mechanical disadvantages of the double type.

It consists of a tank fitted on the wall of the building as high as possible above the press cylinder, and connected to the latter through a 1-in. pipe and a $\frac{5}{8}$ -in. hydraulic valve on the press. The tank is connected to the local water mains through a ball float valve.

Thus, supposing the tank is 20 ft. above the press, this arrangement, with valve open, is capable of imposing on a 10-in. ram a total pressure of about 680 lb., which is more than sufficient to move the ram forward up to the object to be forced.

By coupling the press to the tank on the idle forward travel, a ram speed many times greater than that produced by the operation of the pump may, therefore, be obtained. When the normal forcing pressure is required the tank supply valve is, of course, closed.

This addition to an ordinary hydraulic press will be found to increase the output capacity very considerably and costs very little to install.

Electric Welding with Dynamotor Sets

BY DANIEL DURIE, MASTER MECHANIC WEST PENN RAILWAYS

In order to save the great waste of current (7 to 1) when using resistance to obtain power direct from the trolley line for electric welding on motor repairs and on track work, this company has had constructed some dynamotor sets. These consist of 15-kw. machines with double commutators and armatures having double windings, one side wound for 650 volts and the other side for 80 volts, running at 2200 r.p.m. The 650-volt commutator is in series with the series winding on the field and the shunt field receives its current from the 80-volt commutator, so the wire is comparatively rugged. This makes the machine self-starting by simply hooking a fish-pole connection over the trolley line. At the same time it has sufficient shunt field strength to prevent its running away. This makes a very compact, light-weight, efficient and economical machine.

One point especially important in connection with welding with a machine of this class is having sufficient inductance in the welding circuit. Welding with the arc electrode was very difficult and with metal electrodes was practically impossible until after the welding current was stabilized by inserting an inductance coil. An inductance coil was finally made out of the core of an obsolete type of 4-kw. transformer wound with No. 4 Deltabeston wire. This inductance coil was used dry without a case. After its introduction the welding arc became very stable, and more suitable than when welding from 650 volts. Moreover, practically no resistance was required, as the strength of the welding current could be regulated by the length of the arc.

The provision of ample inductance in the welding circuit is absolutely vital to the success of the low-voltage welding apparatus. It also enables the machine to do far better work than when using 650 volts.

Our welding machines are hung underneath ordinary push carts with the axles arched up sufficiently to make room. The bodies of the push carts are used as lockers for helmets, cables, electrode holders and supplies. It is easy for one man to handle the apparatus around the shop or on the track.

Armature Bearing Jig

BY W. E. NEES, SUPERINTENDENT SELMA STREET & SUBURBAN RAILWAY

The advantage of using a jig for boring motor armature bearings has been generally evidenced by the large number of devices of this character that have been developed, and a simple device of this type is used by the Selma Street & Suburban Railway in its shops, the details being shown in the accompanying illustration. This jig is made large enough to take the largest diameters of bearing, and bushings are inserted for the bearings of smaller size. By adjusting four set screws, of which two are shown in the illustration, it is possible to arrange the jig so that the bearing is bored off-center, and

JIG FOR BORING ARMATURE BEARINGS

the life of the bearing is thus increased about 50 per cent. It has been found that through the use of the jig, an apprentice boy can learn within a short time to bore out bearings as quickly as an experienced machinist.

As shown in the illustration, the jig consists of two parts, one of which is screwed on to the spindle of the lathe. This is bored out to a taper, and in the recess is inserted a bushing, the latter being bored out to fit any particular size of armature bearing. By screwing in the set screws that are located on one side of the jig, the bushing is moved off the center line and the bearing held in it is thus bored eccentric to any desired degree.

Standard Paved Track Construction of the Southern Public Utilities

In a recent issue of the *Southern Public Utilities Company's Magazine*, E. R. Horton, Jr., of the engineering department, described the new form of construction which is being installed in Anderson, S. C., during the present summer. A cross-section of this is shown in the accompanying illustration. The rail support is a concrete beam reinforced with corrugated steel bars in accordance with modern concrete practice. The rail is mounted on the beam on wide bearing plates distributing the weight over 8 in. of width. Long hook bolts, placed at 2-ft. intervals, are used to anchor the rail, the hooks being turned under the reinforcing bars in the concrete beam. To insure permanent contact of the rail with its supports, wooden washers are placed under the base plates and strong lock washers are used on the upper ends of the anchor bolts. This design provides for the forcing of the rail down by the weight of the cars if there is much shrinkage.

At the joints extra support is given by the base plates which run unbroken past them, and the plates are heavily reinforced underneath by means of steel channel.

CROSS-SECTION NEW STANDARD TRACK CONSTRUCTION
SOUTHERN PUBLIC UTILITIES COMPANY

The hook bolts anchor all parts of the joints together. In addition the splice bars are bolted up with Mayari chrome-steel bolts. To avoid pounding of the joints the heads are carefully ground and the rail ends are butted close together.

A monolithic track foundation and pavement are provided in this construction, the concrete paving being favored because it is believed that if properly constructed it is entirely satisfactory, while at the same time it is cheap. Mr. Horton states that in a few places concrete pavements have not been satisfactory on account of the use of inferior mixtures and poor workmanship and of ignorance of the proper method of making expansion joints. The method for making such joints which has been found satisfactory by the Southern Public Utilities Company is as follows: A smooth piece of weather boarding, greased, is placed in the track and the concrete is carefully edged on both sides, the edge being slightly rounded and compacted thoroughly so as to be very hard when the concrete sets. The surface of the street is laid off into large blocks similar in appearance to large bricks, the surface being scored by means of a large scoring board which lays off four rows of block at once. The scoring board is made of heavy timber sawed out to the proper crown and having on its face V-shaped oak strips suitably placed.

There is no groove next to the rail in this construction as the residents of the towns served by the company prefer this crown construction to the groove construction. There is no jolt when vehicles cross the track and there is nothing to catch the wheels of vehicles.

New Track and Conduit Construction at Worcester, Mass.

The Worcester Consolidated Street Railway is engaged in reconstructing double track on Main Street between Lincoln Square and Chandler Street and is placing the feed wires underground. The grouted granite-block paving, laid in 1901 at a cost of \$3.50 per square yard, is the oldest of its type on any business street in the country. The track laid in 1901 consisted of Pennsylvania Steel Company's Sec. 222, 95-lb. girder rails, 8 25/32 in. high, laid on 7-ft. ties. The small amount of wear shown by the pavement upon the removal of the grouted blocks from between the rails and from a strip 2 ft. wide outside each track is indicated by the accompanying halftones.

The new track consists of Pennsylvania Steel Company's Sec. 273, 9-in. 125-lb. girder rail in 50-ft. lengths. The rails are of Mayari steel and the track bolts are of the same material. The rails are laid on 6-in. treated chestnut ties, 8 ft. long, with a minimum face of 7 in., the ties being spaced 2 ft. apart on centers. Rail braces are provided on alternate ties and the joints are of the suspended type, with twelve-hole plates. The track bolts, 1 in. in diameter, have 1/16-in. raised threads and Harvey grips, the guaranteed tensile strength of the material being 100,000 lb. per square inch. Each joint is provided with the American Steel & Wire Company's compressed-terminal copper bonds, one 3 in. and the other 10 in. long, giving full rail-section conductivity. A 500,000-circ.-mil cable is bonded around all special work, and cross-bonding is done every 500 ft.

WORCESTER CONSOLIDATED STREET RAILWAY—RELAYING
BLOCKS BETWEEN RAIL AND OLD PAVEMENT

In laying the new track no ballast was required, an excellent gravel foundation being available. The ties were laid upon a bed of gravel, leveled to within 3 in. of their tops. Concrete of one part cement, three parts sand and six parts crushed stone was poured around the ties to a total depth of 5 in., thus surrounding the base of the rail. On top of the concrete a 1-in. cushion of sand was placed, the paving blocks being bedded upon this by the city. The blocks were laid about 1/4 in. apart and grouted with a mixture of one part cement and two parts sand to a point near the top of the blocks and above this a 1.25 : 1.5 mixture was used. A dressing of pea stone was then broomed upon the granite.

Between Lincoln Square and School Street a strip of felt 6 in. wide and 1/2 in. thick has been placed vertically between a row of blocks laid parallel to the outer rail of each track and the heads of the other paving blocks laid on the street, the axes of the latter being at right angles to the rail. These strips are designed to reduce the noise of the cars by the insertion of a break between the track and the solid structure formed by the paving blocks and the grouting. Pending a test as to the water-tightness of this construction, which was introduced largely as an experiment, it has been decided to omit it in the remainder of the job. The opinion is held in some quarters that with the felt strip in service it may be difficult to prevent water from getting between the block and the rail and ultimately reaching the ties. The space required by the rail braces prevents the application of a continuous strip of felt between the rail and the first row of blocks.

WORCESTER CONSOLIDATED STREET RAILWAY—RELAID
PAVEMENT WITH EXPERIMENTAL EXPANSION JOINT

The feeder conduit consists of thirty or thirty-six 3½-in. Orangeburg fiber ducts laid in a trench 5 ft. deep and 30 in. wide at the bottom. This will contain both positive and negative feeders, and rental space has also been provided. Special manholes were designed for this work by Howard R. Whitney, engineer maintenance of way Worcester Consolidated Street Railway. These are of an offset type, with entrances 30 in. in diameter located at one side of the track. The working chamber, brick-lined at the sides, with an 8-in. concrete base and concrete, brick and steel roof, is 8 ft. long and 5 ft. wide, the height being 7 ft. 6 in. At one side is a step 3 ft. high and 2 ft. 9 in. wide, below the entrance, which was required by the city to facilitate the location of future underground structures. The negative feeders are carried from duct to duct along the roof, the other cables being racked on the wall in the usual way. A sump at one end of the floor provides for drainage into the surrounding gravel soil. The roof is composed of old rails laid parallel to the track, the rails being spaced just far enough apart to allow a course of bricks to be threaded into place between the webs. The bricks are used in place of wooden forms and a 3-in. layer of concrete is poured upon the bricks, forming the roof slab. Thirteen bull rings attached to walls and floor provide means for the handling of cable from the street into ducts by snatch-blocks and pulleys.

Electrostatic Potential and Synchronism Indicators

The General Electric Company has developed several devices employing the electrostatic glower for use on high-tension lines. This glower consists of a spherical lamp bulb with the usual base but without a filament, in fact with no terminal inside the vacuum space. One terminal consists of a brass cap on a glass tube pushed up inside the stem to the point near the center of the bulb. It is connected by a copper wire to another cap mounted on the opposite end of the tube. The base forms the second terminal. When the two terminals are subjected to a sufficient difference of potential a glow is produced in the bulb.

In using the glower for indicating potential on a transmission line, it is mounted on a porcelain base in an inverted position in a metallic condenser hood as shown in two of the accompanying illustrations. The inside terminal is connected direct to the hood while the screw-base terminal is connected in series with an air gap formed by two plates mounted on the under side of the porcelain base. An adjusting screw, seen in the illustration, permits variation in the length of the air

gap. The other side of the air gap goes to a hook by means of which the device can be hung from a line wire. This hook is suitably insulated from the condenser hood. A loop is provided in the suspension hook to permit the indicator to be hung over the line by means of the ordinary switch hook used for operating disconnecting lever switches.

Mounted inside the hood is a switch for cutting the glower in and out of circuit, this switch being connected between the hood and the line hook. When the switch is opened the glower is connected between the line and the hood through the spark gap and will light up if there is potential on the line at least equal to the tension between the line and ground on a three-phase system carrying 15,000 volts. When the switch is closed there is a low resistance path between line and hood, and the glower is cut out of circuit.

The short-circuiting switch can be opened and closed by pulls on the cord by means of this construction: The switch consists of two blades, the upper of which rides on the lower, the latter being raised by a spring not shown. On the upper edge of the lower blade is a notch with which the end of the upper blade engages when the lower blade is pulled down a certain distance. To open the switch the string is pulled downward, bringing the lower blade downward also and the upper blade follows by gravity, its end sliding along the upper surface of the lower blade. After the end of the upper blade has passed the notch on the lower, the pull on the string is stopped and the lower blade starts upward under the action of the spring until the two blades are locked by the engagement of the notch and the end of the upper blade. To close the switch the lower blade is pulled down some distance, say 3 in., and released suddenly, causing the end of the upper blade to jump over the notch, both blades rising under the action of the spring.

A portable form of the indicator is also made in which the switch is omitted and the hood is attached to a long wood rod. In both forms there is provision for protecting the user by means of suitable grounding devices.

Another use for the electrostatic glower is in synchronizing, especially on circuits where transformers are not used for indicating or measuring purposes. The electrostatic synchronizer operates from the line charging current. The glowers are arranged in a case, as shown in one of the illustrations, and are connected to the line through condensers consisting of suspension insulators. The terminals of one glower are connected through the insulators to the leads of the same phase of running and incoming lines. The others are each connected across dissimilar phases of the remaining leads. When the lines are not in synchronism the glowers indicate the relative frequency of the lines in the usual manner. When they are in synchronism the rotating effect disappears, the glower connected to the corresponding lines being darkened and the other two showing about one-half brilliancy. The minimum voltage for operation is 13,200, and the maximum depends only upon the use of the proper number of insulators.

The synchronism indicator can also be used as a ground detector by connecting one terminal of each glower to the ground and the other terminal to the line.

News of Electric Railways

WASHINGTON BUS COMPANY SUSPENDS

Herdic Line, in Hands of Receiver, Returns Coaches to Manufacturer

The Metropolitan Coach Company, Washington, D. C., has suspended operations, and the route along Sixteenth Street through which it has been running is now being served by two different jitney lines under permits from the Commissioners of the District of Columbia. The coach company has surrendered to the International Motor Company, New York, the electric coaches it has been using in this service and they have been shipped back to New York in connection with a claim for an unpaid balance on the vehicles.

The suspension of service followed negotiations with the Public Utilities Commission of the District of Columbia, during which the Metropolitan Coach Company was refused permission to issue \$150,000 of bonds. Permission was granted to issue \$118,000 of bonds, however, but was not availed of, by reason of a number of circumstances, chief among which was, according to statements made at the office of the Public Utilities Commission, that the coach company refused to furnish information, except such as could be obtained from annual reports, as to the use to which the money desired from the bonds was to be put. In this connection an officer of the commission stated to a representative of the ELECTRIC RAILWAY JOURNAL:

"The commission was never able to obtain enough data from the company until toward the end of the service to afford any authority for the issue of bonds. The commission might have authorized bonds and complaints might have been made by the public afterward who purchased them that there were not enough assets behind the bonds. The company could not show property enough. The company also applied for an increase of fare from six tickets for a quarter to a straight 5-cent fare and the commission stated that while such an increase might be justified if better service were furnished, the service before the suspension would not warrant an increase in fare.

"About a year ago the commission received numerous complaints as to the condition of the equipment of the coach company and the service afforded. The commission notified the company again and again to repair the coaches. The company urged the condition of coaches and the necessity for providing new coaches as a reason for the bond issue, and desired to erect a \$30,000 garage and pay off outstanding indebtedness.

"The commission desired to know what had been done with previous funds raised by the company, but no satisfactory information was obtained on this point. The commission also required as a condition for the issue of bonds that the old stock outstanding of the company should be withdrawn, but nothing was done about that. There was an agreement as to the exchange of transfers between the Washington Railway & Electric Company and the Capital Traction Company, which was automatically done away with by the suspension of the company. It could not be expected that either of the street railways would honor tickets or transfers of the coach company when it had suspended service."

The coach company went into the hands of a receiver shortly before its suspension. The Public Utilities Commission of the District of Columbia is of the opinion that the present traffic along the route served by the coach company will be suitably taken care of for the present by the two jitney lines which have been authorized to conduct business.

The Metropolitan Coach Company owned no land and such expenditures as it made for garage and plant facilities were made for leased land. The company owned six coaches, the cost price of which was \$3,749 each, making a total of \$22,494. According to statements made by the commission there is a balance still due thereon of \$2,894. The commission estimated the value of the property of the company just before the suspension at \$11,000. In one of its orders in connection with the case, the commission said:

"Since the company, during a large part of the year 1914, was operating over a longer route than at present, and was

operating four large buses which have since been disposed of, the operating conditions of the company for the year 1913 approximate more closely to the present conditions than do those for the year 1914, and therefore the report of the company for the year 1913 is selected for the purpose of comparison. The net operating revenue for that year was \$1,080.12. Assuming that the revenue passengers will number the same as in 1913, the annual revenue will be increased by \$4,172.14 over that year by an increase in fare to 5 cents, and assuming that the operating expense will remain the same as in 1913 the annual net operating revenue will be \$5,252.26. Assuming the life of the coaches to be six years, the company should be setting aside annually for depreciation \$3,750, and assuming yearly taxes at 1½ per cent on a valuation of \$11,000, the company should provide \$165 annually for taxes. This total annual charge of \$3,915, with a net operating revenue of \$1,080 when operating under the conditions for the year 1913, would leave a deficit of \$2,834, but with a net operating revenue of \$5,252.26 when operating under the same conditions except for an increase of fare to 5 cents it would leave a gross income less operating expenses and taxes of \$1,337.26."

RAPID TRANSIT PROGRESS IN PHILADELPHIA

Bids Received for the Construction of the Broad Street Subway and the Foundations for the Frankford Elevated

The Public Service Commission of Pennsylvania on Aug. 14 gave A. Merritt Taylor, director of city transit of Philadelphia, a certificate of public convenience, granting the application made for authority for the construction of a portion of the subway from a point in Broad Street, at the north side of the existing subway structure north of City Hall, to a point in Broad Street at the south side of the existing subway structure, including station platforms and entrances, and also granted a certificate for the construction of the elevated from Front and Arch Streets to Rhawn Street, Frankford, by way of Front Street, Kensington Avenue and Frankford Avenue.

On Aug. 16 the bids for the construction of the west City Hall section of the Broad Street subway and the foundation for the Frankford elevated line were opened by Director Taylor, in the City Transit Department's offices. Seventeen proposals were placed before Director Taylor. For the subway section, the larger operation, there were six estimates, four of which were made by New York firms. Of the eleven bids for the "L" foundation work, three were from New York concerns, and the rest from Philadelphia. One of the Philadelphia bids, that of James Connor, however, was thrown out, since he had failed to file a bond with the City Solicitor. His offer was \$194,875. The names of the bidders and the prices quoted by them follow:

Broad Street subway:		Lump Sum	Aggregate
Bidder	Bid for	Item No. 1	
Keystone State Construction Company, Philadelphia	\$1,700,000	\$1,737,320
The Foundation Company, New York	1,720,815	1,763,870
Arthur McMullen Company, New York	2,250,000	2,286,060
Frederick L. Cranford, Inc., and Smith, Hauser & MacIsaac, Inc., New York	2,350,000	2,404,770
New York and New Jersey Construction Company, New York	2,449,000	2,486,980
The Snare & Triest Company, Philadelphia	2,758,000	2,787,240
Frankford Elevated Line:		Lump Sum	Aggregate
Bidder	Bid for	Item No. 1	
Edward Fay & Son, Philadelphia	\$179,400	\$188,278
Robert Lombardi, Philadelphia	149,000	155,150
Keystone State Construction Company, Philadelphia	179,000	185,970
Peoples & Rach, Philadelphia	227,000	235,240
American Paving & Construction Company, Philadelphia	307,000	315,640
Oscar Daniels Company, New York	217,000	225,815
Millard & Lupton Company, Philadelphia	260,000	273,150
James D. Dorney, Philadelphia	142,590	149,235
New York & New Jersey Construction Company, New York	282,200	290,450
A. L. Guidone & Son, Inc., New York	190,000	202,334

DETROIT COUNCIL ACCEPTS M. O. PLAN

Accompanying the plan of purchase and a statement of the prospective profits of the Detroit United Railway city lines under the proposed municipal ownership and operation, the Street Railway Commission of Detroit, Mich., sent an explanatory communication to the Common Council on the evening of Aug. 17. The Council accepted the financial statement, the plan of acquiring the lines and the explanatory communication. All were laid on the table until Aug. 23, when the Council will meet as a committee of the whole to discuss them and possibly set a date for a special election at which to submit the proposition to the electors.

In its statement to the Council, the commission bases its estimate of profits on the 1914 earnings of the company. Its accountants, the commission says, have separated the earnings of the so-called one-fare zone from the earnings of the interurban lines included in the Detroit United Railway.

The commission places the earnings of the one-fare zone in 1914 at \$7,889,570. This, added to the earnings from chartered, express and freight cars, and sundry earnings, makes a total of \$8,096,011. From the grand income total the commission subtracts \$6,191,304 for operating expense, maintenance, depreciation and reserve, leaving a net income of \$1,904,707. This amount, of course, does not include interest and taxes.

In a statement to the public, the commission says it has figured that the earnings of the lines will pay for the lines within thirty years and allow \$10,000,000 for betterments. This, naturally, is a speculation, because until the price of the property has been fixed by the circuit court the commission cannot estimate what the interest charges on the debt assumed will be.

INDUSTRIAL RELATIONS COMMITTEE COMPLETES WORK

The United States Commission on Industrial Relations, which for two years has been investigating industrial unrest and its causes, concluded its session in Chicago, Ill., on Aug. 14 and adjourned.

The life of the commission expires on Aug. 23. On Aug. 17 it was announced that two reports had been prepared—a majority report signed by the three representatives of capital and by Prof. John R. Commons and Mrs. J. Borden Harriman, and a minority report signed by Chairman Frank P. Walsh and the three representatives of labor. In a statement Harris Weinstock, an employed member of the commission, said the members found themselves to be unalterably divided on social questions and that the presentation of two reports was the only solution of the deadlock. One of the points on which the commission split was a recommendation in the report drafted by Chief of Staff Basil M. Manley, and fostered by Chairman Walsh, that Congress enact laws confiscating, upon inheritance, all fortunes in excess of \$1,000,000. Another ground of difference was that after the whole commission had agreed to recommend the establishment of a permanent bureau of industrial relations, the Walsh wing of the commission wanted to put the bureau under the Federal Department of Labor. The majority took the stand that this would destroy the very purpose of the bureau because capital would have no confidence in arbiters controlled by labor.

MANDAMUS PROCEEDINGS HOLD UP RAPID TRANSIT CONTRACTS

The Board of Estimate and Apportionment of the city of New York has had before it recently a number of rapid transit contracts awarded by the Public Service Commission for the First District. Under the provisions of the rapid transit act the following procedure is necessary before a rapid transit contract can legally be entered into: Public hearing must be held after due advertisement upon the draft form of contracts, it must then be advertised for bids, and then receive approval as to form by the corporation counsel and receive the consent of the Board of Estimate, which, at the same time, must prescribe a limit of bonds available for such contracts.

All the rapid transit construction contracts prepared by the commission since September, 1910, have been unit price contracts. All the unit price contracts of the commission since the change from lump sum to unit prices have con-

tained a provision, known as Article XII, providing that if any work was not susceptible of classification that it should be done and paid for at cost plus 10 per cent. In view of the great number of unit prices and the fact that the great bulk of the work is comprised in the units of excavation, steel and concrete, Article XII is practically restricted to a very small amount of incidental work.

With two years' experience under the unit price contracts it was found that the practical workings of Article XII could be greatly improved if an alternative method was allowed, whereby the chief engineer, with the approval of the commission, could fix unit or lump sum prices for incidental work as it arose in lieu of the percentage plan. One of the advantages resulted from eliminating the considerable expense of supervision and cost accounting under the percentage provision. Accordingly, early in 1913 the commission submitted to the corporation counsel such an alternative provision. This was approved by the corporation counsel, and has been in every construction contract since that time.

The contracts incorporating this alternative provision amount in value to more than \$73,000,000, and during the past two years have been consented to by the Board of Estimate without question. On the work to date under those contracts the orders under Article XII, including orders under both the percentage and unit price provisions, amount in gross to about eight-tenths of 1 per cent of the work done to date. Many of those orders, however, are in substitution for work which would otherwise have to be done so that the net increased cost due to orders under Article XII would be probably less than half of eight-tenths of 1 per cent. When several large contracts came before the Board of Estimate after being advertised and awarded by the commission that board suddenly insisted on the elimination of Article XII. This raised the questions, first of the legality of the action of the Board of Estimate in giving a consent upon condition, which, the corporation counsel holds, is equivalent to a refusal; and, secondly, whether the commission itself could change a form of contract after its being advertised and bids being received upon it. These questions are now brought before the courts in mandamus proceedings, instituted by the Holbrook, Cabot & Rollins Corporation, one of the contractors concerned, and action will have to be withheld pending the determination of the legal questions.

PROVIDENCE ARBITRATION HEARINGS

Hearings in the Rhode Island Company's wages arbitration case at Providence were resumed last week, with little prospect of their termination before Labor Day. The time has been chiefly occupied by the evidence of motormen and conductors as to the difficulties of their work. At a recent session Mayor Gainer, chairman of the board, ruled that some weight would be given to comparative wage tables. Efforts were made by the men to show that the work of platform men in Providence is more difficult than in Boston, but without much success. The company has not yet begun its rebuttal. Owing to the indisposition of counsel no sessions were held on Aug. 17 and 18, the hearings being continued until Aug. 19.

HOLYOKE STRIKE ENDED

After a complete suspension of service lasting eight and one-half days, the operation of cars on the Holyoke (Mass.) Street Railway was resumed at noon on Sunday, Aug. 15, by the striking employees of the company. The issues between the men and the company, relating chiefly to wages and methods of their payment as affected by figuring platform time or time by the day, are to be arbitrated by a board of three members. One member of this board will be chosen by the company, one by the union and the third by Governor David I. Walsh of Massachusetts. Each party to the agreement is to name his arbitrator by noon on Aug. 21. A conference relative to the third arbitrator was scheduled at Boston early in the week between Governor Walsh and Mayor Woods of Holyoke. The interruption of traffic affected more than 65,000 persons in Holyoke and Amherst, and seriously cut into the traffic on the Springfield-Holyoke route of the Springfield Street Railway. The local service of the Boston & Maine Railroad between Springfield, Holyoke and Northampton was heavily patronized during

the strike and a large jitney bus traffic developed in Holyoke. The latter fell off to insignificant proportions soon after the resumption of street railway traffic. The arbitration agreement was ratified by the members of the union at a meeting in Silverman's Hall on Sunday morning. Cars were placed in operation immediately after the meeting, but normal service was not restored until the evening.

New Electric Line Opened in Utah.—The Ogden, Logan & Idaho Railway, recently completed between Ogden and Huntsville, Utah, has been formally opened to traffic.

Louisiana Line Converted to Electricity.—The line of the St. Tammany & New Orleans Railway & Ferry Company, Mandeville, La., is now being operated by electricity between Mandeville, Abita and Covington. The road has been operated with motor cars. The cost of conversion for electric operation is said to have been \$80,000.

Proposal for Operating Harbor Lines at Los Angeles.—The Harbor Commission of Los Angeles, Cal., has under consideration a proposition made by the Pacific Electric Railway and recommended by Clarence H. Matson, secretary and traffic manager of the commission, for the operation of the city's harbor belt line tracks by the Pacific Electric Railway. Mr. Matson points out that the proposed plan will offer the city practically all the advantages of the terminal agreement that failed to be consummated.

Thirty-three Mile Michigan Line Planned.—The Michigan Traction Company, Jackson, Mich., announces that an appropriation has been made for the construction and equipment of a 33-mile connecting link between existing divisions of its property now having terminals at Owosso and Saginaw. Construction surveys have about been completed, but the final route has not been chosen. This new line will make possible high-speed service between Bay City, Saginaw, Lansing, Jackson, Detroit, and Kalamazoo.

Back Franchise Fees an Issue in Los Angeles.—The Los Angeles Public Utilities Board, in a recent communication to the City Council, declares that the Los Angeles Railway owes the city between \$18,000 and \$20,000 for back franchise fees. The board's claim is based on the contention that franchise privileges originally granted to the company by the county no longer hold, since certain territorial annexations have brought into the city limits and under city jurisdiction certain of the railway's lines.

Mayor Resurrects Chicago Subway Plan.—Mayor Thompson of Chicago, Ill., has in the process of preparation his annual message to the City Council. He has announced that he will resurrect the plans for a subway system for Chicago and make a strenuous effort to get actual work started at an early date. The city's traction fund now totals approximately \$16,000,000, an amount which the Mayor deems sufficient to begin construction at once. He will advocate the initial or downtown subway plan for immediate relief of congestion in the loop, after which a comprehensive system may be undertaken.

New Haven Men Ask More Particulars.—Further particulars were asked on Aug. 16 by the directors, officers and counsel of the New York, New Haven & Hartford Railroad who were indicted some time ago by the Federal Grand Jury for alleged conspiracy to violate the Sherman law. On Aug. 2, in reply to orders of the Federal Court, Assistant United States Attorneys Swacker and Batts filed a bill of particulars containing sixty-three printed pages and 189 paragraphs. Counsel for the defendants, however, have asked Federal Judge Hunt to direct the Government to furnish further and more sufficient specifications. Decision has been reserved.

I. C. C. on Directors' Responsibility.—The Interstate Commerce Commission on Aug. 17 handed down a report on the financial transactions and the operation of the Rock Island Railroad under the Reid-Moore syndicate and the history of the management which finally placed the road in bankruptcy. An aggregate of losses amounting to more than \$20,000,000 is charged to have been caused by the syndicate. In its conclusions the commission has the following to say in regard to the responsibility of directors: "This record emphasized the need of railway directors who actually direct. There are too many directors who acquiesce in what is being done without knowledge and without investigation. A director of a railroad is a quasi-

public official, who occupies a position of trust. A director who submits blindly to the exploitation of his company is a party to its undoing, and he should be held responsible to the same extent as if he had been a principal instead of an accessory before the fact. The greater his prominence, the greater his responsibility and the greater his dereliction. Obviously a man of large affairs could not attend to all the details in intricate transactions, but it is inconceivable that a director of ordinary business prudence and sagacity would sanction large expenditures without an inquiry as to the purposes of such disbursements. So long as this situation exists, however, it suggests the need of a law to charge such directors with individual responsibility for the dissipation of corporate funds."

PROGRAM OF ASSOCIATION MEETING

International Engineering Congress

The International Engineering Congress will be held in San Francisco, Cal., from Sept. 20 to 25. All sessions are to be held in the Auditorium Building, Civic Center, Hayes and Larkin Streets, at Market Street. At the general and sectional sessions a very large number of papers will be presented by eminent specialists. There will be an opening general session on Monday morning, Sept. 20, at which addresses will be presented by the Mayor of San Francisco, Gen. G. W. Goethals, honorary president of the Congress, and by distinguished delegates. The John Fritz medal will be presented to Dr. James Douglas. A general closing session will be held on Saturday morning. The balance of the week will be occupied with sectional meetings. Among the many papers of interest to electric railway men the following may be mentioned:

"Status of the Railways of North and South America," by F. Lavis, New York, N. Y.

"Italian Railways," by Prof. Luigi Luiggi, Rome, Italy.

"The Status of Railways and Tramways in the Netherlands East-Indies," by E. P. Wellenstein, The Hague, Holland.

"Economic Considerations Controlling and Governing the Building of New Lines," by John F. Stevens, New York, N. Y.

"City Planning," by Nelson P. Lewis, New York, N. Y.

"London Traffic in 1913," by Sir Albert Stanley, London, England.

"Transit Problem in American Cities," by W. F. Reeves, New York, N. Y.

"Machine Shop Equipment, Methods and Processes," by E. R. Norris, East Pittsburgh, Pa.

"Machine Shop Equipment, Methods and Processes," by H. F. L. Orcutt, Rowington, England.

"High Temperature Flames in Metal Working," by H. R. Swartley, Jr., Jersey City, N. J.

"The Internal Combustion Engine," by Prof. C. E. Lucke, New York, N. Y.

"The 1915 Steam Turbine," by E. A. Forsberg, Stockholm, Sweden.

"The Diesel Engine in America," by Max Rotter, St. Louis, Mo.

"Streets," by George W. Tillson, New York, N. Y.

"Economics of Electric Power Station Design," by H. F. Parshall, London, England.

"Track and Roadbed," by George H. Pegram, New York, N. Y.

"Electric Welding," by C. B. Auel, East Pittsburgh, Pa.

"Effects of Electrolysis upon Engineering Structures," by Prof. A. F. Ganz, Hoboken, N. J.

"The Mechanical Problem of the Electric Locomotive," by G. M. Eaton, East Pittsburgh, Pa.

"Utilities," by President A. C. Humphreys, Hoboken, N. J.

"Public Utilities," by Edward Willis, Chiswick, England.

"Electric Motive Power in the Operation of Railroads," by William Hood, San Francisco, Cal.

"Electric Motive Power in the Operation of Railroads," by E. H. McHenry, New Haven, Conn.

"Signals and Interlocking," by Charles Hansel, New York, N. Y.

"Safety Engineering," by F. R. Hutton, New York, N. Y.

"Motor Vehicles," by Ethelbert Favary, New York, N. Y.

"The Boiler of 1915," by Arthur D. Pratt, New York, N. Y.

Financial and Corporate

KANSAS CITY PLAN FILED

Judge Hook's Arrangement Accepted by City and Reorganization Managers—Railway and Lighting Properties to Be Segregated

Another important step toward the reorganization of the Metropolitan Street Railway, Kansas City, Mo., was made on Aug. 16, when Judge Hook's plan was accepted by the managers who will supervise the refinancing of the street railway and electric light systems of the city, and a certified copy of the plan was filed with the clerk of the Federal court. The agreement, which embodies as its main features the almost complete exchange of old securities and the separation of the railway and the lighting properties, was described briefly as to its principal provisions in the *ELECTRIC RAILWAY JOURNAL* of Aug. 7. City Counselor Evans, who has approved the plan on behalf of the city, says:

"The way is now clear for the refinancing of the company and for putting it on a strong and permanent financial basis by which it can meet all of its obligations under the franchise extension and give Kansas City a better street car service than ever."

The three banking houses, Kuhn, Loeb & Company, Lee, Higginson & Company and Blair & Company, which have had much to do in the past with the securities of the old companies, have by their acceptance of the plan become reorganization managers for carrying out its provisions. H. L. Stuart, of N. W. Halsey & Company, Chicago, Ill., is designated as the personal representative of Judge Hook

become a party to the plan on or before Oct. 1. The pending franchise required the Kansas City Railways to acquire within six months, or such extended time as the city might give, the portion of the street railway system in Missouri. This time was extended to July 7, 1915, and again to Nov. 7, 1915, upon the express condition that the reorganization follow Judge Hook's plan now published.

Judge Hook's plan provides that the lighting and street railway properties be separated in ownership and control so that they may be financed and operated by companies wholly independent of each other. It is now generally admitted that there should be no holding company owning the stocks of both, nor should the stocks or properties of both be mortgaged or pledged to secure the same obligations. With minor exceptions, the present holding company, the Kansas City Railway & Light Company, now holds or controls, subject to pledges, the stocks of the lighting company and the street railways, and has outstanding \$15,678,000 of its own funded obligations. In Judge Hook's opinion, the separation presents little difficulty if a just proportion of that indebtedness be unconditionally set off against the lighting company to the relief to that extent of the street railways. Previous plans suggested that an amount in excess of \$5,000,000 be so set off, but the amount now fixed as the conservative proportion is \$4,977,300. This would leave \$23,722,700 of the old funded debt to be cared for by the new Kansas City Railways. The new company and the lighting company should each take care of its own part of the debt by its own obligations, and the equity then left for the stockholders of the Kansas City Railway & Light Company should be distributed among them as they may determine, without supervision or approval by Judge Hook, provided no common corporate control of the electric and street railway properties is maintained or created.

TABLE — SHOWING NEW SECURITIES AND BASIS OF EXCHANGE

Total	\$28,700,000	...	\$7,922,000	\$10,150,200	\$5,291,000	\$3,060,000	\$1,917,300

NOTE—Interest will be adjusted as of July 1, 1915, and holders of the bonds will, in addition to the new securities, receive in cash the interest accrued and unpaid on the existing bonds to said date, as well as additional interest as stated in the plan.

*Approximate.

†Additional bonds of same lien not presently issued to bear interest not exceeding 6 per cent, as determined by directors.

††Series A, 6 per cent; Series B, 5 per cent. Sinking fund, \$105,820 per annum.

‡Sinking fund, \$38,346 per annum.

to co-operate with the foregoing. These managers are to take such steps as may be required to vest the necessary titles in the proper parties, and by foreclosure at Kansas City, exchange, purchase or otherwise acquire for the new street railway company, the Kansas City Railways, and the Kansas City Electric Light Company or its successor all the street railway and electric light properties, so as to clear the same of all existing mortgages, pledges and liens, except as to the Kansas City Elevated Railway and Kansas City & Westport Belt Railway mortgages, for which special provisions are made. Details in conformity with the plan may be adopted by the managers.

When such acquisitions and the releases in addition justify, the managers may declare the plan operative and cause new securities to be issued, in the meantime issuing interim certificates if necessary. Protective committees representing Metropolitan Street Railway consolidated 5's, Kansas City Railway & Light Company collateral note 6's and refunding 5's and Central Electric Railway 5's have already approved the agreement and in addition as of Aug. 19 the terms of participation therein. Any person interested may

It is stated that the stockholders of the Kansas City Railway & Light Company who own the equity in the lighting and street railway properties should not be assessed further than as provided in this plan for, since the receivers were appointed and up to May 31, 1915, the stockholders have received no dividends. In addition to interest paid on the bonds, \$4,486,755 has been expended on the properties—\$1,664,142 upon the lighting company and \$2,822,613 by the receivers upon the street railways. Furthermore, the defaulted franchise obligations of the old street railways, claimed by the city to be about \$7,000,000 and to be superior to the rights of existing bondholders, are cared for in the new franchise in a modified and extended form and assumed by the new company, and that much of the burden will fall on the stockholders without corresponding increase of income. Moreover, the franchise provides that \$6,300,000 of the surplus earnings of the new company shall be used for "extensions and additions to the property" without increase of capital value on which returns are available for dividends to stockholders. It is proposed, however, that the stockholders shall take or cause to be taken at par suffi-

cient of first and refunding bonds to pay the reorganization expenses chargeable to the street railways and not paid from current funds, the liabilities, claims and charges judicially determined to be prior and paramount to the bonds to be refunded, and to supply the new company with \$1,000,000 in cash for new capital expenditures. Pending reorganization all necessary steps will be taken to provide for advancements of capital value required by the franchise by the issuance of receivers' certificates.

The holders of the bonds of the old companies who become parties to the reorganization are to receive interest at the rates last paid, respectively, to July 1, 1915, the date of the bonds of the new company, except that the holders of the Kansas City Railway & Light Company 5's shall receive an additional 1 per cent per annum from May 15, 1913, to the date above mentioned, and the holders of Metropolitan Street Railway consols shall receive additional interest at the rate of 1 per cent per annum for the period from May 1, 1913, to Nov. 1, 1913.

The bonds of the new company are to run for the life of the franchise. The manner in which it is intended that the new securities shall be distributed is shown in the table on page 330.

Judge Hook states that a reorganization of the Metropolitan Street Railway system and the acceptance of the new thirty-year franchise, which has been conditionally tendered, are imperative if even the bondholders are to save their investments intact. The funded debt amounts to \$28,700,000 (part electric lighting debt), of which more than \$25,000,000 is past due. There is also a large amount of other liabilities, part of which is claimed to be superior to the bonds. In commenting on the plan Judge Hook says:

"This plan is not framed to make a profit or to give an advantage to any security holder. It is not intended to make the old bonds worth par in the present market except as the assurance of safety and intrinsic worth of the bonds of the new company for which the old ones can be exchanged at par may so result. So far as practicable and just the old status has been carried forward and the relative rights of each class of creditors, preferred, secured and unsecured, have been preserved. The franchise tendered by the city offers a way out of much difficulty and loss. It is not likely another will be granted, certainly not without extreme sacrifice. This plan is recommended to every person having an interest in the property."

OHIO TAX VALUES \$160,887,220

The value of the street, interurban and suburban railways of Ohio, according to the figures of the State Tax Commission, is \$160,887,220. This is a net increase of \$8,450,700 over the valuation fixed for taxation purposes in 1914. Approximately one-fifth of the total increase was assigned to the Cleveland Railway, thus placing its valuation far above the figures on which the company has several times refused to pay taxes in the past. The increase on this property over 1914 is \$1,717,320, making the total for the year \$24,470,050. The Cincinnati Traction Company with a valuation of \$19,232,270, an increase of \$471,870 over 1914, is second to the Cleveland Railway.

The valuations of other large properties follow:

	Value	Increase
Ashtabula Rapid Transit Company.....	241,330	6,950
Cleveland, Alliance & Mahoning Valley Railroad	707,540	347,750
Cleveland, Painesville & Eastern Railroad... 1,825,260		66,850

ANNUAL REPORT

Illinois Traction System

The comparative statement of income, profit and loss of the Illinois Traction System, Peoria, Ill., for the calendar years 1913 and 1914 follows:

	1914	1913
Earnings:		
Interurban lines	\$3,626,636	\$3,604,265
City lines	3,021,859	3,072,236
Gas	877,982	816,911
Electric	3,002,378	2,636,714
Heat	314,640	274,672
Water	14,386	13,539
Miscellaneous	254,973	102,761
Total gross earnings.....	\$11,112,854	\$10,521,098
Total operating expenses, including taxes	6,587,462	6,198,873
Net from operation.....	\$4,525,392	\$4,322,225
Interest on bonds, etc.....	3,290,787	2,883,239
Available for depreciation, etc.....	\$1,234,605	\$1,438,986
Less depreciation	309,580	
	\$925,025	
Less bond discount for 1914.....	47,956	
Surplus, 1914	\$877,069	

In 1914 the arrangement which had been under consideration for several months, covering the consolidation of the Western Railways & Light Company with the Illinois Traction Company, was consummated on a basis acceptable to the directors of each company. The operating properties of the Western Railways & Light Company included the Atchison Railway, Light & Power Company, the Cairo Electric & Traction Company, the Cairo & St. Louis Railway, the Chicago, Ottawa & Peoria Railway, the Galesburg Railway, Lighting & Power Company, the Northern Illinois Light & Traction Company, the Quincy Railway and the Wichita Railroad & Light Company. The above financial statement for 1914 includes the reports of the newly acquired companies, so that the results of the two years are not strictly comparable.

The interurban and street railway receipts for the year, however, were affected by the general business depression, which caused the closing of many manufacturing in whole or in part, and also by the increased use of the automobile, both in town and country. The general result was a slight decrease in the earnings of these properties. Satisfactory increases in the electric and gas departments were obtained by judicious advertising and strenuous campaigns for the introduction of improved appliances. There was a gratifying decrease in the operating costs at generating stations, but this was partly offset by the increase in taxes and the increases in the wages of trainmen. Taxes for the year were \$61,484, or approximately 16.6 per cent above the amount expended during the preceding year. New wage schedules decided by arbitration increased this item of expense \$31,617.

Between Springfield and Carlinville and between Staunton and Edwardsville the installation of electric automatic block signals was completed, and now all the interurban trackage contemplated when the installation was decided upon is protected by this type of signal. During the year the demand on the freight equipment was such as to justify the purchase of additional cars, and an order was placed for fifty standard hopper-bottom coal cars of 50-ton capacity.

Alton & Jacksonville Railway, Alton, Ill.—In an appeal from the decision of the Illinois Public Utilities Commission the Alton & Jacksonville Railway, the successor to the Alton, Jacksonville & Peoria Railway, has filed a suit in the Sangamon County Circuit Court in an effort to reorganize with a capital stock of \$750,000 and a bond issue of \$500,000. When the company decided to extend its lines from Jacksonville to Peoria, application was made to the commission for permission to reorganize with the above-stated capitalization, but its ruling cut the capital stock down to \$192,000 and the bonds to \$450,000. Although this order has not been accepted, the old company has been taken out of receiver's hands and the new company is operating the electric railway from Alton to Jacksonville.

Argenta (Ark.) Railway.—The Argenta Railway was sold on July 28 to the Intercity Terminal Railway Company for a nominal consideration. The latter company was incorporated a few weeks ago and held a franchise for the opera-

tion of street cars or motor cars from Markham and Main Streets, Little Rock, to the center of the free bridge. The Argenta Railway held a franchise for the operation of cars from Argenta to the center of the free bridge, in addition to the street railway system in Argenta. With the consolidation of the two companies and the installation of bridge car service, transfers will be issued to passengers from the Argenta lines to the bridge cars or vice versa. It is said that arrangements will also be made for the transfer of passengers from the bridge cars to the Little Rock street cars. It is reported that three large motor buses with seating capacity for twenty passengers are now being constructed on the order of the Intercity Terminal Railway and will be placed in service on the bridge. The officers of the Intercity Terminal Railway are: C. C. Kavanaugh, president; E. W. Jackson, vice-president, and F. J. Schmutz, secretary and treasurer.

Boise (Idaho) Railroad.—As stated in a preliminary announcement in the *ELECTRIC RAILWAY JOURNAL* of Aug. 7, the lines of the Boise Railroad and the Idaho Traction Company have been separated. The Boise Railroad has refused to honor the transfers given by the Idaho Traction Company and it is understood the matter is to be taken before the Public Utilities Commission for a hearing. The Boise Railroad has reorganized, with W. E. Pierce, president; H. E. Dalton, general manager; R. G. Jennings, vice-president; J. M. Haines, secretary, and L. H. Cox, treasurer.

Fort Madison (Iowa) Street Railway.—The election that was to have been held on July 17 for the approval of the Mississippi Valley Electric Company franchise in Fort Madison has been postponed until Sept. 9. This company recently took over the property of the Fort Madison Street Railway on the condition that the new franchise for the latter company, recently passed by the City Council, be approved by the voters.

Grand Valley Railway, Brantford, Ont.—The negotiations between the Lake Erie & Northern Railway and the city of Brantford, with reference to a portion of the Grand Valley Railway section of the lines operated as the Brantford Municipal Railway, have been concluded. As a result, the Lake Erie & Northern Railway has acquired for \$30,000 the portion of the Grand Valley Railway from Paris to Galt, a distance of about 13 miles. The Brantford Municipal Railway will in the future consist of the old Brantford Street Railway and the Brantford-Paris section of the old Grand Valley Railway, the latter being about 8 miles long. The feature of rearrangement is the electrification of the entire Lake Erie & Northern Railway line from Fort Dover to Galt, as described elsewhere. Until this electrification is completed, the purchased section of the Grand Valley Railway will be operated by the Brantford Municipal Railway Commission.

Idaho Traction Company, Boise, Idaho.—The United States Circuit Court of Appeals at San Francisco has handed down an opinion affirming the findings of Judge Dietrich of the Idaho Federal District Court, who cancelled \$718,000 of bonds held by the Idaho Traction Company on the property of the Idaho-Oregon Light & Power Company. The fight for the cancellation of the bonds was made by what was known as the Priest committee against the so-called New York committee.

International Traction Company, Buffalo, N. Y.—The directors of the International Traction Company have formulated a plan for the retirement of the present \$5,000,000 of 4 per cent cumulative preferred stock, together with the accumulated and unpaid dividends thereon, by the issuance on a share basis of new 7 per cent cumulative first preferred stock, which will have priority in all respects over the existing 4 per cent issue. Under this plan, which has already been approved by the greater part of the preferred and common stockholders, the elimination of 42 per cent of accumulated and unpaid dividends will increase the company's credit and the value of its outstanding securities. The accumulation of dividends on the 4 per cent stock came about through the restrictive provisions of the original collateral trust indenture, which prevented the International Railway, the operating company, from issuing any securities to provide for improvements and extensions required by its rapid growth. The readjustment of the indebtedness in 1912 obviated this sit-

uation, and since then the company has paid the regular 4 per cent dividend on the preferred stock. Now a dividend will be declared and paid on this stock from the date of the last dividend payment to the date from which the dividend on the new 7 per cent first preferred stock will accrue. A two-thirds vote of both preferred and stock is necessary for the adoption of the plan.

Kansas City Viaduct & Terminal Railway, Kansas City, Mo.—The protective committee for the first mortgage $4\frac{1}{2}$ per cent bonds of the Kansas City Viaduct & Terminal Railway has called a meeting of the holders of its certificates of deposit for Sept. 9 to vote on a proposition to extend for a period of two years the life of the protective agreement, which expires by limitation on Jan. 1, 1916. Within this period the committee hopes to procure a purchaser for the property. Since the receivers of the Metropolitan Street Railway in 1911 failed to secure a reduced toll charge for the viaduct structure, there has been no street car service upon the viaduct. Negotiations for the disposal of the structure have been carried on unremittingly with various prospective purchasers, but with no results thus far. It is stated that until the Metropolitan Street Railway property is reorganized, no plan can be intelligently worked out for the rehabilitation or sale of the viaduct property.

Montreal (Que.) Tramways.—The stockholders of record on Sept. 10 have been offered the right to subscribe until Oct. 25 for \$1,000,000 of common stock of the Montreal Tramways in the proportion of one new share for every three shares held. The subscriptions are payable 10 per cent on Oct. 25, with the balance in assessments on two months' notice.

Newport & Fall River Street Railway, Boston, Mass.—The stockholders of the Newport & Fall River Street Railway at their recent annual meeting approved a proposition to issue \$100,000 of additional capital stock and \$123,000 of bonds, both in accordance with leases to the Bay State Street Railway.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—The California Railroad Commission has authorized the Oakland, Antioch & Eastern Railway to issue two notes, one for \$90,400 to the Union Trust Company, San Francisco, and the other for \$10,000 to A. W. Maltby, in place of a note for \$100,400 previously authorized for issuance to the Union Trust Company.

Pacific Gas & Electric Company, San Francisco, Cal.—The gross operating revenue of the Pacific Gas & Electric Company for the calendar year 1914 was \$16,912,688, as compared to \$15,869,006 in 1913. The maintenance, operating expenses, taxes and reserve for uncollectible accounts and casualties in 1914 amounted to \$8,913,922, and for 1913 to \$9,331,206, leaving net earnings from operations of \$7,998,766 in 1914 and \$6,537,799 in 1913. After adding the other income and deducting fixed charges, the balance for 1914 was \$3,645,666, as compared to \$2,723,044 in 1913. Of the year's gross, including miscellaneous income, only 3 per cent came from street railway operation, that of the Sacramento Street Railway. This company's gross revenue for 1914 was \$556,908, a decrease of 2.79 per cent, as compared to the result for 1913. This decrease was caused by temporary local conditions and also, to some extent, by the competition of jitney buses. The total number of passengers carried during the fiscal year amounted to 12,256,142, and the car mileage to 2,481,968. During the year the stockholders of the holding company increased 133 per cent. Since June 3, 1914, the company has sold \$10,177,300 par value of first preferred 6 per cent stock, \$6,039,600 or 59 per cent of which was purchased by stockholders and \$4,137,700 or 41 per cent by employees, patrons and others. The total amount realized was \$8,396,272, of which \$7,840,229 has already been paid in.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The United Properties Company, which is the holding company for the San Francisco-Oakland Terminal Railways, was on Aug. 11 sued for approximately \$2,500,000 in a San Francisco Court by the Anglo-California Trust Company, trustee. The suit was brought on behalf of N. W. Halsey & Company, who loaned that sum to the Oakland Railways in August, 1912. The loan bore interest of 6 per cent and was payable June 12, 1913. No part of the principal has ever been paid, according to the complaint. It

is said that at the time the loan was made the outstanding stock of the Oakland Railways was 270,000 shares, of which the United Properties Company owned 169,990. The company's proportionate stockholders' liability for the loan, therefore, is stated to be \$2,488,796. Simultaneously with the filing of this suit, a similar suit was filed against several hundred owners of stock in the San Francisco-Oakland Terminal Railways, which the complaint says is the actual holding company of the Oakland Railways. These stockholders are declared to be liable according to the number of shares owned. The same judgment is asked in this suit.

Virginia & Ohio Securities Corporation, New York, N. Y.—The controlling stock interest in the Steubenville, Wellsburg & Weirton Railway and the Wellsburg Electric Light, Heat & Power Company, formerly held by the Tri-State Railway & Electric Company, was recently acquired by the Virginia & Ohio Securities Corporation. The railway and the lighting companies, however, have not yet been merged.

DIVIDENDS DECLARED

American Railways, Philadelphia, Pa., quarterly, 50 cents, common.

Central Arkansas Railway & Light Corporation, Hot Springs, Ark., quarterly, 1¾ per cent, preferred.

Connecticut Valley Street Railway, Greenfield, Mass., quarterly, three-fourths of 1 per cent, common.

Northern Texas Electric Company, Fort Worth, Tex., 3 per cent, preferred; quarterly, 1 per cent, common.

Terre Haute Traction & Light Company, Terre Haute, Ind., 3 per cent, preferred.

JITNEY JOTTINGS

Eighteen Paragraphs Which Deal Briefly with the Moribund Jitney

The jitney in Camden, N. J., has proved to be a financial failure. Competition has ruined the business, according to Charles Austermal, president of the Camden Jitney Company, which has suspended operation. The Camden Jitney Company was incorporated at \$50,000 and was one of the first in business there. It started with three large touring cars. Business proved to be so profitable that, after a month's operation, the company was incorporated and ran twelve cars. Other companies which operate jitneys in Camden are the West Jersey Jitney Company and the Winton Line. Including the independent operators, it is said there are about 300 cars doing business in Camden.

Numerous arrests of jitney drivers at Galveston, Tex., have followed the failure of the drivers to provide the bond of \$10,000 as protection for passengers and the public against accident. Steps are being taken by the jitney operators to carry one of the cases now pending on the corporation court docket here through the higher courts for an opinion from the State Supreme Court. The Galveston ordinance affects the automobiles now running on the Galveston-Houston line, and the contention of the jitney men will be that neither Houston nor Galveston has jurisdiction over the business as the men in the business are operating strictly an inter-city line.

The City Council of El Paso, Tex., has revised its jitney ordinance by providing for larger indemnity bonds by jitney drivers. Under the old requirement companies owning and operating as many as ten cars were required to give bond for only \$500 per car. Under the new requirement, a bond of \$1,000 per car is required regardless of the number of cars a company operates.

A grievance committee has been named by the jitney men of Dallas, Tex., to express their objections to the new ordinance which was agreed upon by the president of the jitney union and the City Commissioners. The head of the chauffeurs' union is opposed to the ordinance and says it has never received the sanction of the membership. The new ordinance is being strictly enforced.

Another test of the rights of cities to regulate jitneys will be made in the case of the jitney men of Austin, Tex., where a recent city ordinance has been enforced. An effort will be made to get the case before the Supreme Court of Texas and avoid the Court of Criminal Appeals, which has already upheld the cities' right in the case of I. W. Sullivan concerning the Fort Worth ordinance.

A petition asking for a referendum election on the new jitney ordinance of Houston, Tex., was presented to the City Council on Aug. 7, following the refusal of the city to reduce the license fee from \$72 to \$36. All of the principal requests of the jitney men were granted by the city except as to license fee. The ordinance does not require a bond and in many respects is regarded as very liberal to the jitney interests. The new regulations were to have gone into effect on Aug. 10, but the referendum election will suspend them indefinitely. Mayor Campbell is in favor of having the voters express themselves on the subject.

R. E. Platt, manager of Idora Park at Youngstown, Ohio, and five of his employees on Aug. 7 filed suits for damages aggregating \$60,000 on the charge of false arrest against ten jitney bus owners and their attorneys. When the Youngstown Park & Falls Street Railway began charging an entrance fee of 10 cents to people taken to the park by the jitney buses, the owners retaliated by having the park employees arrested on the charge of violating the Sunday closing law. They were dismissed recently.

The new ordinance in Des Moines, Iowa, regulating the operation of jitney buses did not go into effect on Aug. 9 because of an appeal to the Supreme Court from the decision of District Judge Utterback, who held that the jitney ordinance recently passed by the Council was valid in every particular. It provided that jitney operators must designate their routes and give bond for the protection of passengers and pedestrians.

The City Council of Charlotte, N. C., has passed a jitney regulatory ordinance. The feature of the ordinance is the provision requiring the filing of a bond for \$1,500 for the first bus operated and of a bond for \$1,000 for each bus after the first one. Routes must be designated and a record filed of the hours during which it is intended to render service. The routes are subject to approval by the officials of the city.

On July 30 Mayor Grace of Charleston, S. C., ratified the ordinance passed by City Council recently for the regulation of the jitney bus traffic in Charleston. Thirty days after the affixture of the Mayor's signature are allowed jitney operators in which to file the bond assessed according to the provisions of the ordinance.

On Aug. 3 the City Commissioners of Passaic, N. J., passed an ordinance on first reading to regulate the jitneys. The ordinance provides that the license for a bus carrying twenty or more passengers shall be \$25 a year. Smaller buses will be charged \$15, and \$5.50 will be asked from those using automobiles as jitneys.

The Muskogee (Okla.) Electric Traction Company has announced that it will operate one-man cars in that city on account of jitney competition.

The Dominion Power & Transmission Company, which owns the street railway at Hamilton, Ont., has reported to City Treasurer Leckie that the jitneys have been responsible for a decrease in its receipts of \$24,218 for three months. The number of jitneys on the main streets is now about 200. The city is taxing cars at the rate of \$5 a seat.

Police Judge Meyers at Cedar Rapids, Iowa, holds the bond feature of the jitney ordinance recently adopted in City Council to be unconstitutional. The measure provided for a bond of \$3,000 to guarantee indemnity to passengers injured through the carelessness of a jitney bus operator. The court held this amount to be prohibitive.

The City Council of Albuquerque, N. M., by a vote of five to two has served notice on the Albuquerque Traction Company that the franchise of the company will be forfeited if within thirty days it does not show to the satisfaction of the Council that arrangements have been made for adequate service before October. This is the reply of the city to the receiver of the company, who threatened to continue the present curtailment of service for six months unless the Council passed a jitney regulation prepared along lines suggested by him.

The Mayor of Quincy, Ill., has returned to the Council without his approval the ordinance to regulate the jitney passed there. He considers the ordinance unduly burdensome. He expressed the hope that the Council will see its way clear "to prepare a new ordinance which will be fair and reasonable, and generally acceptable."

In Kansas City the opportunity to go into the jitney business, hailed as a godsend to the laboring man and mechanic to get into business for himself, turned into a catastrophe when companies were organized to give scheduled service, largely eliminating the "little fellow." The companies in turn quickly got into trouble through inability to handle labor questions with facility, and through inexperience in the management of the new form of industry. Leavenworth, Kan., offers another phase of the distressing situation. Here the jitney owners were called upon to provide the same protection to the public, the same contribution, proportionately to the incomes, to the public, as other institutions, and had to quit business. In Muskogee, however, the alleged profits of the business have appealed strongly to the City Commissioners, who advocate establishing a municipal system to eliminate the private owner. One of the most illuminating incidents of the recent news is the estimate at Muskogee that the city could set aside \$30,000 a year from the proceeds of a municipal jitney system for street maintenance.

The city of Ottumwa, Iowa, has been sued by the estate of Charles Chessier for \$20,000, the deceased having been killed in an accident involving a jitney bus and a street car. The attorney for the estate asserts that the street railway is not liable, but that the city is, one point being that the jitney skidded on an iron grating in a gutter and was thrown into the street car, and another that the city has adopted no regulatory measures intended to govern the operation of jitneys.

ALBANY SERVICE ORDER

Summary of the Provisions of the Latest Order of the Commission Regarding Cars

The Public Service Commission for the Second District of New York made an order on Aug. 13 for the improvement of the rolling stock of the United Traction Company, Albany, in the case which has been before the commission since May 1, 1912. The latest order provides as follows:

The immediate purchase of fifteen new modern cars, completely equipped, seating capacity at least thirty-four, to be put in service in Albany before Dec. 1.

The purchase of ten more like cars to be placed in service in Albany during 1916.

Removal of present cars from "A" Belt Line to be rebuilt and re-equipped for service on the Albany-Troy lines.

Fifteen double-truck, double-end cars now on Albany-Troy line to be rebuilt for tripper service on the belt and other lines.

Eleven double-truck, double-end cars to be rebuilt for the Troy-Albany lines.

Eight single-truck, double-end prepayment cars with 21 ft. 3 in. bodies to be improved as to entrances and exits.

Sixteen single-truck cars with 21 ft. 3 in. bodies to be similarly rebuilt.

One single-truck car to be similarly improved.

Ten single-truck, 18-ft. cars to be rebuilt into five double-truck, center-entrance cars for use on various lines in Albany.

General overhauling and repairing of twenty-eight single-truck cars which have already been rebuilt for prepayment operation.

These alterations, repairs and additions will cost the company between \$100,000 and \$200,000, will increase the number of cars available by about fifty and the seating capacity of the system by between 400 and 500.

The order is made as the result of the decision of the Appellate Division, which compelled the United Traction Company to fulfill all but one of the provisions of the commission's order of last December. Upon that one, involving the purchase of new cars, the commission was ordered to give the company a rehearing, the company alleging that financial difficulties incident to the war in Europe made it impossible to purchase the new equipment ordered. Of this impossibility the present order of the commission says with regard to the evidence submitted at the rehearings held on May 25, June 1 and June 23:

"While it did not appear on the hearings to the entire satisfaction of the commission that the respondent was unable to comply with the provisions of Paragraph 7 of the order of Dec. 11, 1914, because of the European war, yet it did appear that the earnings of the respondent in Albany had decreased very materially during the first half of the year 1915 and that there would probably be no material improvement in the earnings of the company during the continuance of the present business depression. No evidence was submitted to the commission to show that the purchase of new cars and improvements in the present operating equipment of the respondent were unnecessary, and the commission is still satisfied that the respondent should improve its service in these respects forthwith. The respondent also indicated that it was willing to purchase and place in service in the city of Albany during the present year at least fifteen new cars in order partially to comply with the provisions of Paragraph 7 of the order of Dec. 11, 1914."

Paragraph 7 of this order called for the immediate purchase of twelve new modern cars seating forty, to take the place of the 18-ft. cars then in use and the subsequent purchase of thirty more new cars. While the present order does not provide for the purchase of quite so many new cars it provides in addition a practical rehabilitation of all of the rolling stock of the company, bringing it all up to the most modern standards of prepayment cars.

The order is based to some extent on a recommendation of Charles F. Hewitt, the company's manager, and C. O. Birney, the car expert of Stone & Webster, Boston, who made a report to the commission, checked by the commission's own experts in which the recommendations of the order of Aug. 13 were embodied, with the reasons there-

for and the expense of carrying out the improvements.

The present Belt line cars are ordered rebuilt for the Troy service in accordance with the recommendations of Messrs. Hewitt and Birney by installing bulkheads, remodeling doors so that the rear doors will slide one on the other for entrance and exit, dividing rails and fare boxes to be removed and wood slat seats placed about the rear platform for ten passengers, making a total seating capacity of sixty-two, and the wheels, axles, gears and motors of the present Troy cars be substituted for those now on the Belt line cars.

The fifteen cars now in Albany-Troy service will be rebuilt for Albany service by lengthening the platforms and providing folding doors and folding steps on each side, removing the bulkheads and installing the fare boxes, wheels, axles, gears and motors taken from the present Belt line cars. All defects will be remedied and the cars painted and varnished.

Eleven cars now in service to Troy will also be brought up to date by lowering and lengthening the platforms, installing folding doors and steps, the rearrangement of bulkheads and the removal of the smoking compartment and the placing of all cross-seats on one side as in the present Belt line cars. These cars also will be thoroughly painted and varnished.

Eight of the present single-truck, prepayment cars in use on the Quail Street division are to be remodeled by rearranging doors and steps in a safer manner with the steps folding automatically with the doors, the sagging ends trussed up and the cars touched up and varnished. These cars are those numbered between 554 and 573. Sixteen cars numbered between 501 and 535 will be rebuilt by having the bulkheads removed, folding doors and steps on each side of each platform with doors opening outward, all defects remedied, cars painted and varnished and arranged for prepayment service. Car 570 will be equipped with folding steps.

The rebuilding of ten of the old 18-ft. cars into five double-truck, center-entrance cars will give Albany and vicinity the first cars of this type used here. Each of these new cars will have a seating capacity of fifty-four, or 270 seats in all as against the 240 seats now available in the ten 18-ft. cars. The work of rebuilding these and all the other cars, including shortening of the trucks, etc., will be done in the company's own shops.

Mr. Birney and Mr. Hewitt in their report recommend that the fifteen new cars to be purchased be used in the Belt line service and prescribe their construction, but only the purchase of the cars is ordered by the commission. According to the report these cars would be the most modern single-truck cars, 32 ft. long over the buffers and seating thirty-two passengers, doors, steps and platforms to be of the automatic folding prepayment type and the seats arranged six reversible and two cross-seats on each side with birch-wood slats and frames. They would weigh 21,000 lb. each and would cost about \$52,000. Ten of these cars would furnish 640 seats for the 635 passengers on the line at the noon hour. The total weight of these cars would thus be 210,000 lb. against a total weight of 460,000 lb. for the present ten Belt line cars. Affording sufficient seats, the report says that thus in lighter weight \$12,500 in power can be saved annually. It recommends the use of twelve cars on the belt line with three extras each way during the rush hour. The details of this report are not approved by the commission. For instance, it insists that the new cars contain two more seats than those recommended by Messrs. Hewitt and Birney. The company has until Aug. 25 to notify the commission whether it will comply with the terms of this last order or further appeal to the courts.

Milwaukee Skip-Stop Order Sept. 1.—The Railroad Commission of Wisconsin expects to issue its order calling for experimental skip stops on the Wells-Farwell, the Greenfield Avenue and the Walnut Street lines of The Milwaukee Electric Railway & Light Company so as to be effective on Sept. 1.

Electric Meets Steam Competition.—The Alton, Granite City & St. Louis Traction Company, Alton, Ill., has announced that it will sell ten-ride tickets between Alton and St. Louis for \$4, good for sixty days, with transfer privileges in Alton. This is the cheapest rate ever made be-

tween the two cities, and was arranged to meet steam railroad competition.

Hearing on Trenton Fares in September.—Following a hearing on Aug. 17 before the Board of Public Utility Commissioners of New Jersey at Trenton, that body announced that it would delay for three months the plan of the Trenton & Mercer County Traction Corporation to abandon its six-for-a-quarter strip tickets in favor of a flat 5-cent fare. The commission has announced that a hearing on the matter will be held on Sept. 21.

Progress in Physical Connection Case.—The result of the hearing of the Public Service Commission of Oregon on the petition for physical connection of the Oregon Electric Railway and the Southern Pacific Company lines at Albany will not be made public for at least six weeks. After the testimony is filed the plaintiffs will have twenty days to file a brief. The Southern Pacific Company, contesting the petition, will then have fifteen days to file its answer, and the shippers five days.

Operating Agreement Between Ohio Roads.—An arrangement has been completed between the Northern Ohio Traction & Light Company and the Cleveland, Alliance & Mahoning Valley Railway by which limited trains will be run between Cleveland and Alliance. They will operate over the Northern Ohio Company's tracks to Ravenna and from there to Alliance over the Cleveland, Alliance & Mahoning Valley Railway. Warren, Niles and Youngstown may be reached over lines connecting with the latter road at Newton Falls and Leavittsburg.

Sign Changes in Cleveland.—In accordance with an ordinance passed recently the Cleveland (Ohio) Railway has arranged the signs on the front and sides of all cars so that the destination is shown. Signs are changed to comply with the direction in which the car is going. The street signs at the top of the cars, of course, are retained. Some further changes will be made in signs relating to the payment of fares, but before this can be done satisfactorily some standard policy for the payment of fares will have to be adopted by the street railway commissioner's office.

"Your King and Country Need You; We Can Spare You." These words were written on all the pay checks of the British Columbia Electric Railway, Vancouver, B. C., that were handed out to employees recently. A. T. Goward, local manager at Victoria, said: "There is no other meaning to the statement than that which the words convey. If any of the men feel called upon to go to serve their king and country, the company will not hinder them in doing so. We are following along the lines of the Canadian Pacific Railway and other big Canadian companies who have written similar intimations on pay checks."

Rules for Dogs on the Northern Ohio System.—A new rule regarding the carrying of dogs other than lap dogs on cars of the Northern Ohio Traction & Light Company, Akron, Ohio, is now in effect and duly covered by a supplement to the authorized tariff. Under this rule dogs other than lap dogs may be taken on cars only when a permit has been obtained from the company. A charge of 25 cents will be made for any distance. Permits will not be issued to take dogs on the limited cars. During the hunting season the necessity of obtaining a permit will be waived, but the charge will be as above stated. In all cases dogs must be properly secured by strap or collar and chain.

Transfer Controversy in Boise.—Further development in the situation brought about by the refusal of the Boise (Idaho) Railroad to exchange transfers with the Idaho Traction Company is the order by the Public Utilities Commission of Idaho directing Attorney General Peterson to file a complaint against the companies, in order that the matter may be formally brought before the commission for discussion. The lines of the Boise Railroad, for two years a part of the Idaho Traction Company's system, were recently taken over for separate operation by the Boise Railroad, and that company has refused to exchange transfers with the Idaho Traction Company. The commission's present idea is to compel the interchange of transfers, and the railroad companies will have to show cause why such an order should not be issued.

Personal Mention

Mr. Frank H. Miller, superintendent of the Louisville (Ky.) Railway, has been elected to the Louisville Rotary Club, as the railway power plant member.

Mr. John Holley Clark, formerly counsel of the Flushing Association, has been appointed secretary to Col. William F. Hayward of the Public Service Commission for the First District of New York.

Mr. Willis J. Ripley, who has been assistant secretary, assistant treasurer and auditor of the American Public Utilities Company, Grand Rapids, Mich., has been elected treasurer of the company.

Mr. Guy E. Tripp, chairman of the board of directors of the Westinghouse Electric & Manufacturing Company, has been elected a director of the Chase National Bank, New York, N. Y., succeeding Henry M. Conkey, deceased.

Mr. Bradley B. Hogue, formerly associate editor of the *Times-Herald* of Dallas, Tex., has been made assistant to Mr. Edward T. Moore, secretary and manager of the Dallas Consolidated Electric Street Railway and has been placed in charge of the publicity department of the company.

Mr. A. L. Farquharson, manager of public utilities, Fort William, Ont., has taken over the management of the municipal electric railway there, succeeding Mr. M. O. Robinson, formerly manager of both the Fort William and the Port Arthur Municipal Electric Railways, who continues to manage the Port Arthur Electric Railway.

Sir Albert H. Stanley, managing director of the London tramway, omnibus and tubes companies, is defraying the cost of providing tea at treats for the wives and children of the London United Tramways employees now serving in the army. The treats takes place at some rural spot near each depot, and the incidental expenses and the cost of prizes are defrayed by the employees and the various clubs and institutes.

Sir Adam Beck, chairman of the Hydro-Electric Power Commission of Ontario, received an electric automobile at the opening of the London & Port Stanley Railway in London, Ont., on July 22, in conformity with the motion made by Mayor Church of Toronto last February at the convention of the Hydro-Electric Union. The presentation was made by Mr. Philip Pocock, London, chairman of the London & Port Stanley Railway.

Mr. Thomas B. Smith, Philadelphia, has been appointed to the Pennsylvania Public Service Commission by Governor Brumbaugh, taking the place of Congressman Keiss, who did not accept the appointment offered by the Governor. Mr. Smith was born in Philadelphia in 1869 and was postmaster there during the administration of President Taft. He served in the Philadelphia Common Council and was elected to the Legislature for two terms.

Mr. Harro Harrsen, who had charge of the Dr. Pearson interests in Mexico until he was driven out by the revolutionists, and in April last went to Barcelona to take charge of the Pearson syndicate's interests in Spain, has, according to advices from there, been elected vice-president of the Ebro Irrigation & Power Company, managing director of the Barcelona Tramways, managing director of the Barcelona Electric Company and director of the Sarria Railway.

OBITUARY

Albert Siegel Mohr, Lincoln, Ill., special agent for the Illinois Traction System, Peoria, Ill., is dead, following a stroke of paralysis.

Edward H. Hoyt died at his home in Haverhill, Mass., on Aug. 6, aged sixty-six years. Mr. Hoyt began his railway career with the Haverhill & Groveland Street Railway, Haverhill, Mass., afterward becoming electrical engineer for the Merrimack Valley Street Railway. Following the consolidation of these lines, he became electrical engineer for the Haverhill & Georgetown Street Railway. Later he became president of this road and was also prominent in the People's Telephone Company of Haverhill. He served in the Massachusetts House of Representatives in 1898 and 1899.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Rapid Transit Company of Illinois, Murphysboro, Ill.**—Incorporated in Illinois to construct an electric railway from East St. Louis to Mount Carmel, via St. Clair, Monroe, Randolph, Jackson, Williamson, Saline, Hamilton, White, Edwards and Wabash counties, with special branch lines to Chester and Murphysboro. Capital stock, \$100,000. Incorporators: Joseph Vonnahme, Daniel P. Roberts, Conrad B. Vonnahme and M. Harned, East St. Louis, and Louis T. Hooltman, Collinsville.

***Fort Wayne, Decatur & Southern Railroad, Decatur, Ind.**—Incorporated in Indiana to build and operate an interurban railway. Capital stock, \$10,000. Incorporators: M. Gerke, C. Oetting and C. Dirksen.

***Tennessee Electric Railroad, Nashville, Tenn.**—Incorporated in Tennessee to consolidate the interests of the Cumberland Valley Railroad, Tennessee & Kentucky Railroad and the Nashville, Springfield & Northern Railroad. Capital stock, \$50,000. Incorporators: Lee Baker, William Myers, S. W. Thompson, E. G. Stribling, Robert C. Leonard and H. L. Shoulders.

FRANCHISES

South San Francisco, Cal.—The South San Francisco Railroad & Power Company has asked the Council for a franchise to construct, maintain and operate a single-track or double-track, standard-gage railway in South San Francisco. Bids will be received by William J. Smith, city clerk, until Aug. 30 for this franchise. A certified check of 10 per cent, payable to the treasurer of the city of South San Francisco, must accompany each bid.

Aurora, Ill.—The Aurora, Mendota & Western Traction Company has received a twenty-year franchise from the Council which gives the company the right to use the highways between the southern city limits of Aurora near the Spring Lake cemetery and the limits of the village of Montgomery.—[June 26, '15.]

Waukegan, Ill.—The Chicago & Milwaukee Electric Railroad has asked the Council for a franchise to operate cars in Waukegan.

North Andover, Mass.—The Bay State Street Railway has asked the Council for a franchise to lay double tracks on Sutton Street, North Andover.

Webster Groves, Mo.—The United Railways Company of St. Louis has received a new twenty-eight-year franchise from the Council of Webster Groves, which carries with it the improvement of Lockwood Avenue from Summit Avenue to Rock Hill Road, about 1 mile, at a cost of approximately \$80,000. New rails will be laid.

Corpus Christi, Tex.—By a referendum election held in Corpus Christi on Aug. 10, the Corpus Christi Traction Company was awarded a franchise to build and operate an electric interurban line to connect with the county line. The principal terminal of the proposed road will be Ward Island, 8 miles south of Corpus Christi, where it is proposed to build an amusement park and pleasure resort. J. H. Caswell, San Diego, is interested. [July 31, '15.]

***Bremerton, Wash.**—W. D. Peters, Bremerton, has asked the Council of Bremerton and Charleston for franchises to construct an electric railway in both towns.

Vancouver, Wash.—The ordinance repealing the franchise of the Washington-Oregon Corporation on Fifth Street through the garrison at Vancouver Barracks, and on East Seventh Street has been put over until the latter part of August by the Council at the request of H. K. Lugg, manager of the corporation, who explains that the company was in the hands of a receiver, and that it expects to reorganize and consequently may have money with which to build the line.

TRACK AND ROADWAY

Pacific Electric Railway, Los Angeles, Cal.—Surveys are being made of the last link of this company's line between Los Angeles and Corona. The road has been completed and in operation as far as Yorba Linda and Stern for some time.

Municipal Railways, San Francisco, Cal.—The Board of Public Works has passed a resolution awarding the contract for furnishing and delivering track special work, under contract No. 7, Section "E" Municipal Railway System, bond issue of 1913, to the United States Steel Products Company, at its bid on file.

West Sacramento Electric Company, Sacramento, Cal.—This company, which was incorporated in February, 1915, will be dissolved on Sept. 5. The company, with the consent of the California Railroad Commission, recently sold its properties to the Pacific Gas & Electric Company for the sum of \$30,000. [Feb. 20, '15.]

East St. Louis & Suburban Railway, East St. Louis, Ill.—This company reports that it expects to install track circuit signals on two miles of single track between French Village and O'Fallon division. Apparatus has been purchased from the United States Electric Signal Company.

Chicago, Ottawa & Peoria Railway, Joliet, Ill.—This company reports that it expects to build two plate girder bridges, one to consist of four 43-ft. spans and one to consist of two 35-ft. spans.

Murphysboro Electric Railway, Light, Heat & Power Company, Murphysboro, Ill.—Work has been begun by this company on the reconstruction of its line in Murphysboro.

Peoria & Chillicothe Electric Railway, Peoria, Ill.—A mortgage of \$1,500,000 was authorized at a recent meeting of the stockholders and directors of this company. [Aug. 6, '15.]

Union Traction Company of Indiana, Anderson, Ind.—This company is placing the massive 50-ft. steel girders used in building the tracks over the Milton Avenue subway in Anderson.

Kansas City, Kaw Valley & Western Electric Railway, Bonner Springs, Kan.—It is stated that work will be begun at once on the construction of this company's extension from Bonner Springs to Lawrence.

***Salina, Kan.**—It is reported that a company is being organized to build an interurban railway from Salina to Fairbury, Neb., via Concordia and Belleville. The Arkansas Valley Interurban Railway will connect with the proposed line at Salina.

Salina (Kan.) Northern Railroad.—The Salina Northern Railroad will be operated as a standard gage steam railroad; but for the passenger service General Electric gasoline-electric motor cars will be used. The contracts for the equipment, and for materials for construction have been made. The railroad will be 90 miles in length, extending from Salina through Salina, Lincoln, Mitchell and Osborne counties, all in Kansas, to Osborne and Downs. Three miles of track have been laid out of Salina, the grading is practically completed between Salina and Lincoln, 35 miles, and several bridges are under construction. The Salina Northern Railroad is being built by the Keystone Construction Company, Salina, Kan., of which E. A. Tennis is president. Officers announce that they hope to have the line in operation by Jan. 1, 1916.

***Cumberland Traction Company, Edmonton, Ky.**—This company has been formed by G. H. Greenup, Elizabethtown, with a capital stock of \$50,000, to build and operate a line between Edmonton and Elizabethtown. Plans as to the terminus of the road have not matured, although it is stated that the line may connect with the Hodgenville and Elizabethtown branch of the Illinois Central Railroad or with the Louisville & Nashville Railroad in Hart County. The first step proposed is the construction of the line between Edmonton and Hiseville, 16 miles. Right-of-way has been secured.

St. Tammany & New Orleans Railway & Ferry Company, Mandeville, La.—Operation by electricity has been begun on this company's line to connect Mandeville, Abita and Covington. The line was converted from motor-car operation to electric operation at a cost of \$80,000. [April 17, '15.]

Lewiston, Augusta & Waterville Street Railway, Lewiston, Me.—Frederick B. Teeling, Litchfield, has suggested to A. H. Ford, third vice-president and manager of this com-

pany, the advisability of constructing an electric railway from Topsham to Monmouth. Under the plan outlined by Mr. Teeling, the road would start at Topsham or Brunswick, go to Bowdoinham, thence to Richmond corner, passing through Litchfield, crossing the Lewiston, Augusta & Waterville Street Railway at Tacoma and going to Litchfield Mills and on into Monmouth. The road would be 33 miles in length.

Portland (Me.) Railroad.—This company has been granted trackage rights on York Street in order to connect its tracks on the new Portland bridge with its regular street lines.

Boston (Mass.) Elevated Railway.—A contract has been entered into between the Port Directors of South Boston and the Boston Elevated Railway to lay double tracks and install overhead equipment and necessary connections for a line from Summer Street along the viaduct to the new Commonwealth Pier, thence down the ramp, crossing D Street and coming back up Northern Avenue to a point directly opposite the entrance of the Fish Pier. The extension will cost approximately \$50,000.

Detroit (Mich.) United Railway.—This company is reconstructing its tracks in Birmingham on the Pontiac division.

Twin City Rapid Transit Company, Minneapolis, Minn.—This company reports that it plans to build a double-track extension from the Snelling-Minnehaha line to the new Twin City motor speedway, 1½ miles, with storage tracks for 100 cars. The company has just completed a steel-plate girder bridge to carry the county road over the tracks of the Lake Minnetonka line at Brookside Station.

Metropolitan Street Railway, Kansas City, Mo.—John M. Egan, 1500 Grand Avenue, Kansas City, has been delegated by the receivers of this company to solicit sealed proposals on or before Aug. 25, 1915, to construct and complete ready for operation on or before Dec. 31, 1915, double track on portions of Broadway, Twenty-fourth Street, Thirty-first Street and Main Street and single track on Prospect Avenue and Twelfth Street, Kansas City, in all about 38,935 ft. Plans and specifications will be furnished upon application. Bids to be received for this work are officially advertised elsewhere in this issue.

***Three Forks, Mont.**—Construction has been begun on a new line between Three Forks and Radersburgh. It is reported that Julius Rosholt, Fairmount, N. D., is financing the new railway.

Alamance, Durham & Orange Railway & Electric Company, Burlington, N. C.—Plans are being considered by this company to build an extension of its line from Burlington to Elon College and Gibsonville and then to Altamahaw and Ossipee. Junius Harden, Burlington, is interested. [June 26, '15.]

Cincinnati (Ohio) Traction Company.—The Council of Cincinnati recently authorized a bond issue of \$3,000 to extend and improve Reading Road in order to allow the construction of this company's extension to Bond Hill. It is proposed to build the line on Reading Road, as the courts have ruled that it cannot be built on Paddock Road because consents of the property owners cannot be secured.

Cleveland (Ohio) Railway.—County Commissioners Andrews and Metzger declared in favor of the issue of \$2,200,000 in bonds on Aug. 14 for the construction of subway approaches to the new bridge across the Cuyahoga River from both the east side and west side for the use of the Cleveland Railway and interurban traffic. The commissioners have authority to issue bonds for this purpose, according to Assistant Prosecuting Attorney Green. J. J. Stanley, president of the Cleveland Railway, has expressed a willingness to pay rental for the use of the subways and Street Railway Commissioner Witt has been quoted as saying that the saving in time and expense on the part of the railway will almost equal the amount that will be paid in rental.

Oklahoma (Okla.) Railway.—A report from this company states that it will rebuild at once 1 mile of roadbed, using 100-lb. steel ties and concrete and brick paving.

Hamilton, Ont.—The Hamilton Hydro-Radial Union was informed on Aug. 10 that the engineers of the Hydro-Electric Power Commission of Ontario at work to the south of Hamilton are surveying for an electric line not only from Hamilton to Port Dover and other points on Lake Erie, but

for a line which will enter into competition with those of the Dominion Power & Transmission Company, as well as the steam road of the Toronto, Hamilton & Buffalo Railway. The plans call for a Hydro-Radial railway to St. Catherines and all intermediate points, including a branch line to Dunnville, Cayuga, etc.

Portland Railway, Light & Power Company, Portland, Ore.—The Portland Railway, Light & Power Company is relaying its double tracks on East Glisan Street, between East Sixtieth and East Seventy-fifth Streets.

Southern Pacific Company, Portland, Ore.—D. W. Campbell, assistant general manager of the Southern Pacific Railway, stated recently: "We are ready to start work on our electrification to Corvallis as soon as the City Council of that city grants us a franchise." The Southern Pacific's proposition to the Council asks permission to lay a second track on Sixth Street, paralleling the existing track of the old Oregon & California Railroad; a second track on Ninth Street, paralleling the existing track on the old Corvallis & Eastern Railroad; a track on Van Buren or some other parallel street, satisfactory to the people of Corvallis, and another track on Washington Street, making a complete loop. The Southern Pacific Company has set aside money to pay for an electric extension from Whiteson, the present terminus, to Corvallis, 43 miles. This will give the company an electric line from Portland to Corvallis, 97 miles, with an alternate route between McMinnville and Portland of 50 miles. The proposition of granting the franchise will come before the Corvallis Council at an early date.

Philadelphia & West Chester Traction Company, Upper Darby, Pa.—The Philadelphia *Ledger* said recently: A determined effort on the part of the Philadelphia & West Chester Traction Company to force an entrance into Chester is believed to be behind a purchase of a tract of 5 1/3 acres of land in Sharon Hill immediately opposite the Collingdale terminus of the Philadelphia & Garrettford Railway, one of the subsidiaries of the Philadelphia & West Chester company. While entrance to Chester is believed to be the object of the company, the obvious route, which would be through Darby and Ridley townships, would strike almost through the property of the Baldwin Locomotive Works, and one of the most densely populated districts of the county would be traversed.

***Washington, Pa.**—Business men of Washington are interested in a proposition to construct a street railway to connect Washington with the mining communities of Ellsworth, Cokeburg, Bentleyville and adjoining districts. The proposition as outlined calls for a line about 11 miles in length that would join the Pittsburgh Railways system in Washington with the terminus of the Bentleyville-Charleroi Street Railway at Cokeburg.

Montreal & Southern Counties Railway, Montreal, Que., Can.—This company reports that it expects to install an interlocking plant and signals for a single-track diamond at Abbotsford, Quebec.

Tennessee Electric Railroad, Nashville, Tenn.—This company has recently been organized to consolidate the interests of the Cumberland Valley Railroad, Tennessee & Kentucky Railroad and the Nashville, Springfield & Northern Railroad. The rights-of-way of these three projects, two of which have already been surveyed and secured, aggregate 275 miles of road, which at present has no railroad facilities whatever. Nashville, it is stated, will be the pivotal point. The first step proposed is to be the construction of the Cumberland Valley road, which is to extend from Nashville via Smithville to Sparta. The Southern Finance & Construction Company is named as having arranged the financing of the project.

Dallas (Tex.) Southwestern Traction Company.—J. O. Andrewartha, consulting engineer of the Dallas & Southwestern Traction Company, has advised the Board of Commissioners that the interurban railway of that company will be built from Dallas to Austin and that a system of interurban lines will be constructed with Austin as the radiating center. He says that all financial arrangements for the construction of several hundred miles of interurban lines have been made and that the work will be carried on as rapidly as the material can be handled. Besides building a trunk line south from Dallas to Austin, branch lines will extend to San

Angelo, Brownwood, Lockhart, San Antonio and probably to other towns. The Dallas & Northwestern Traction Company, which is owned by the same interests, is preparing to construct an interurban railway from Dallas to Denton. The cars will be operated by gasoline motors. [July 10, '15.]

Northern Texas Traction Company, Fort Worth, Tex.—This company advises that construction has been begun on the extension of its Summit Avenue line about 1 mile south.

San Antonio (Tex.) Traction Company.—Work has been resumed by this company on the construction of double tracks on Goliad Street, San Antonio, after a delay of almost a year. The work of concreting the tracks on South Presa Street has been completed.

Petersburg & Appomattox Railway, Petersburg, Va.—A contract for the construction of this company's line from Petersburg to City Point has been awarded to the Vaughan Construction Company, Roanoke, for about \$200,000. [Aug. 14, '15.]

Radford-Willis Southern Railway, Radford, Va.—Grading has been begun at Little River between Snowville and the mouth of Indian Creek for this company's 28-mile line from Radford to Willis. Williams Brothers Construction Company, contractor. J. L. Vaughan, president. [July 10, '15.]

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—Plans are being considered by this company to construct a new passenger station at Pomona. No definite location has as yet been selected.

Municipal Railways of San Francisco, San Francisco, Cal.—The contract for the construction of the second story of the carhouse of the Municipal Railways of San Francisco at Geary Street and Presidio Avenue has been awarded to James L. McLaughlin by the Board of Works for \$26,747.

Wilmington & Philadelphia Traction Company, Wilmington, Del.—William D. Haddock & Company have been awarded the contract to build an addition to this company's carhouse at Delaware Avenue and duPont Street, Wilmington, and work will be begun at once. The American Bridge Company received the contract for the steel structural work.

New York, N. Y.—Following are unofficial totals of bids opened by the Public Service Commission on Aug. 3 for station finish on Route No. 50, the Queensboro Subway extension, and on Sections Nos. 1 and 3 of routes Nos. 36 and 37, the Corona elevated railroad in Queens: Snare & Triest Company, New York, \$611,563; Marble Arch Company, New York, \$750,000. Bids opened on Aug. 4 for station finish on Section No. 2 of Routes Nos. 36 and 37, the Astoria elevated railroad in Queens: Charles Meads, New York, \$272,000; Snare & Triest Company, New York, \$274,296; Simon Russeck, Inc., New York, \$285,270.

Toronto (Ont.) Civic Lines.—Works Commissioner R. C. Harris told the Board of Control in a report on Aug. 11 that it would cost \$285,000 for the city to establish car shops with a maximum capacity of fifty car bodies a year. The commissioner repeated his former report that car shops are not necessary at present and that after the franchise expires the city would not be warranted in establishing a manufacturing plant, inasmuch as the requirements of a street railway system can be provided more economically by the car builders.

Marshall (Tex.) Traction Company.—This company reports that it has just completed an addition to its carhouse to accommodate three new cars received in June and July.

POWER HOUSES AND SUBSTATIONS

Montreal & Southern Counties Railway, Montreal, Quebec, Canada.—This company reports that it has awarded a contract to the Nicholson Construction Company of Montreal for the construction of a substation at Granby, Que. A contract has also been awarded to the Canadian Westinghouse Company for one 400-kw. motor generator set and to the Northern Electric Company for a switchboard.

Salt Lake & Utah Railway, Salt Lake City, Utah.—This company has contracted with the Westinghouse Electric & Manufacturing Company for a substation at Springville. The station will be equipped with three 250-kw. rotary converters but will be designed to accommodate additional machines as needed.

Manufactures and Supplies

ROLLING STOCK

St. Albans & Swanton Transit Company, St. Albans, Vt., has purchased one set of double trucks and two new four-motor equipments, complete.

Anaconda (Mont.) Street Railway reports the addition of six new 50-ft. cars to care for increased business on local lines. The new cars will be similar to the large motor cars now in use.

Albuquerque (N. M.) Traction Company has ordered from the St. Louis Car Company seven steel underframe double-end, one-man cars to be mounted on St. Louis 9-ft. wheel-base trucks equipped with Westinghouse WEE motors. The cars complete will weigh 11,500 lb.

United Traction Company, Albany, N. Y., has been directed by the Public Service Commission of New York, Second District, to purchase immediately fifteen new modern cars, completely equipped, with a seating capacity for at least thirty-four passengers, to be put in service before Dec. 1, and ten more similar cars to be placed in service during 1916. The company is also required to rebuild its present car equipment as noted in detail elsewhere in this issue.

New York & Long Island Traction Company, Long Island City, N. Y., has specified the following details of equipment for the six double-truck end-entrance car bodies recently ordered from the Southern Car Company:

Length over all...42 ft. 5 in.	Registers	Dayton
Length of body...31 ft. 8 in.	Gears and pinions.....	West.
Bolster centers.....19 ft.	Gongs	Brill Dedenda
Width over posts...8 ft. 6 in.	Hand brakes.....	Lord
Height, rail to sills..35½ in.	Hand straps.....	Rico
Body	Heaters	Consol.
Interior trim.....cherry	Headlights ...	"Golden Glow"
Roof	Journal boxes.....	Symington
Air brakes.....West. Type H	Motors.....	West. 307-V
Bumpers,	Paint	Chicago
Hedley anti-climbers	Resistances	E.M.B.
Cables	Seats.....	Hale & Kilburn
Control	Springs	Southern
Curtain fixtures, Cur. Sup. Co.	Trolley	Nuttall
Curtain material...Pantasote	Trucks.....	Brill 27-M.C.B.-2
Destination signs.....Hunter	Ventilators	Ry. Utility

TRADE NOTES

Tubular Woven Fabric Company, Pawtucket, R. I., has been awarded the highest prize, a gold medal, for Duraduct, the well-known flexible non-metallic car conduit, by the award jury of the Panama-Pacific Exposition, San Francisco.

Metals Coating Company of America, Chicago, Ill., has opened an office at 100 Summer Street, Boston, Mass., in charge of Herbert Jaques, Jr., who is prepared to furnish information and demonstrate the Schoop metal coating process.

Walter A. Zelnicker Supply Company, St. Louis, Mo., has purchased the good-will and stock of the Bintliff Supply Company, successor to Bintliff & Herb, who did a general railroad, mill and factory supply business and specialized in railroad track tools, such as Jim Crow rail benders, track drills, etc.

Elcon Company, New York, N. Y., has received an order from the Connecticut Company for forty-six sets of unbreakable E. M. B. resistances for the new cars recently ordered by this company. The cars will weigh 17 tons and will be equipped with two GE 40-hp. motors and K-6 control. These resistances are also specified on the six cars recently ordered by the New York & Long Island Traction Company.

Harrisburg Water Laboratories, Harrisburg, Pa., have been organized for the purpose of making chemical examinations of water. The organization consists of L. McCreath of the firm of Andrew S. McCreath & Son, analytical and consulting chemists, Harrisburg, Pa., Dr. G. R. Moffitt, city chemist, and Farley Gannett, consulting engineer, formerly engineer of the Water Supply Commission of Pennsylvania.

W. S. Barstow & Company, Inc., New York, N. Y., have reorganized their department of construction engineering, with Arthur M. Torrey, formerly with Hildreth & Company, New York, in charge. Prior to 1908, this firm was very active in railway, public utility and industrial construction. In that year it branched out into the ownership and management of public utilities, of which it now controls about forty in the Eastern and Middle Eastern States. During the past seven years less attention was given the construction engineering department than formerly, though the company never retired from this field. The reorganization of the department betokens greater activity along this line. In connection with the construction engineering department, the company has instituted an industrial bureau for the purpose of assisting in developing industries in the communities where it controls utility properties. In these places working arrangements have been made with the local chambers of commerce and a co-operative plan of locating industries is being worked out.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" safety illumination headlights, reports shipment of headlight equipment to the following railways during the month of July: Altoona & Logan Valley Electric Railway; Fort Smith Light & Traction Company; Wichita Railroad & Light Company; Southern Traction Company, Waco, Tex.; Kentucky Traction & Terminal Company; Denver (Col) Tramway; Sioux City Service Company; St. Louis Car Company for new cars of the Southwestern Gas & Electric Company; Southern Car Company for new cars of the Corpus Christi Railway & Light ompany; Tidewater Power Company; Gulfport & Mississippi Coast Traction Company; Hutchinson Interurban Railway; Wason Manufacturing Company for new cars of the Tucson Rapid Transit Company; Shreveport (La.) Railways; Windsor, Essex & Lake Shore Railway; Detroit United Railway; Terre Haute, Indianapolis & Eastern Railway; McGuire-Cummings Manufacturing Company for new cars of the Iowa Railway & Light Company; Omaha & Council Bluffs Street Railway; East St. Louis & Suburban Railway; New York, Westchester & Boston Railway; Metropolitan Street Railway; El Paso (Tex.) Electric Railway; New York & Queens County Railway; St. Louis Car Company for the Wisconsin-Minnesota Light & Power Company's new cars; Rockford & Interurban Railway; Packard Motor Car Company for new trucks of the Honolulu Rapid Transit Company; Mason City & Clear Lake Railroad; Lebanon-Thorn-town Traction Company; Hattiesburg Traction Company; Cincinnati Car Company for new cars of the Binghamton (N. Y.) Railway.

ADVERTISING LITERATURE

Tool Steel Gear & Pinion Company, Cincinnati, Ohio, has issued a folder which contains service comparison between tool steel gears and pinions and special quenched gearing, which show a greater length of life in favor of the former type.

General Electric Company, Schenectady, N. Y., has issued Bulletin No. 47,406, which describes the company's Type F, Form K-20 oil switch, for use on voltages up to 2500. These switches are built in three capacities: non-automatic and automatic, for use on two, three and four-wire systems, and for current up to 300 amp. They are especially adapted for conditions where inflammable materials or explosive gases are present.

S K F Ball Bearing Company, New York, N. Y., has just made a notable contribution to the light car and power economy situation, by issuing a booklet entitled, "Economies of the Light Car in Electric Railway Service." At a time when electric railways are finding it necessary to use every possible source of economy, this book should be very welcome indeed. Facts and figures are presented to show why the big heavy car really is not as economical and efficient in the end as the small car, equipped with such modern devices as ball bearings. The problem is viewed broadly from the maintenance of car details to the promotion of travel by giving higher speed and shorter headways. A number of illustrations show what progress has been accomplished in light car construction to date, while others show energy tests and excellent drawings of the S K F bearings.

W. H. Huff, Beverly, N. J., successor to the Stokes Wood Preserver Company, has issued a catalog describing its preservative paint, "Locustine," for treating ties and poles. This compound increases the life of wood, toughens the wood and makes it less liable to mechanical abrasion, notably in the case of rail cutting on railroad cross ties. It also increases the holding power of spikes and log bolts. The catalog shows illustrations, accompanied by testimonial letters, showing two black oak ties which have been under track on the Pennsylvania Railroad continuously for nineteen years and which are still in a fine state of preservation. Another illustration shows ties in process of treatment for use on the Philadelphia (Pa.) Rapid Transit Company.

Stow Manufacturing Company, Binghamton, N. Y., has issued Bulletin 400 describing and illustrating a few of its portable tools, both belt and electric driven. Special effort has been made to design these tools with a maximum proportion of power to size. Several of the designs are constructed to save floor and bench room, being of the suspended types, thus putting them out of the way in a safe place when not in use and always in easy reach of the operator. The tools described in the catalog include two spindle drills, electric breast drills, S1-U universal drills, drills for heavy work, friction sensitive drill, tool post grinder, electric bench grinder, electric hand buffer with flexible shaft motor combination, motor-driven screwdrivers, flexible shaft center grinders, radial flexible boring machines, suspended drills, portable energy grinders and suspended-type direct-connected buffer or grinder.

Q. & C. Company, New York, N. Y., has issued a large, complete and handsomely bound catalog describing and illustrating its railway materials, including Bonzano rail joints (used on the Pennsylvania Railroad), rolled steel step joints, cast metal rail joints, insulated rail joints, special reversible tie plates, Vaughan automatic rail anchor, guard rail clamps, adjustable rail braces, guard rail braces, portable rail saws, Samson rail benders, rail inspecting device, derails, Fewings wrecking frogs or replacers, skid shoes, Gilman-Brown emergency knuckles, Ajax vestibule diaphragms, snow flangers and Edman refrigerator car doors. All the illustrations and diagrams, especially those showing the rail devices, are large and clear, and in the case of the rail joints show how the lower part of the splice-plate projects between the ties below the base of the rail, thus forming a splice approximating the strength of the rail.

F. D. Spotswood, Lexington, Ky., safety promoter, has issued a catalog which describes and illustrates completely his illustrated safety-first campaign accident blotters, warning newspaper cuts, two color car signs and safety-first buttons. The catalog recommends especially the use of warning blotters in schools where their pictorial appeal to the children, when one design at a time is distributed, with explanation from teachers, is especially profitable, not only because of the widespread and permanent effect upon the growing generation, but also because it is the best and easiest way to interest and educate the general public through parents and friends of the children. The catalog illustrates a large number of designs which are being used by the Bay State Street Railway, St. Joseph Railway, Light, Heat & Power Company; Waterloo, Cedar Falls & Northern Railway; Milford & Uxbridge Street Railway; San Diego Electric Railway; Sheboygan Railway & Electric Company; Roanoke Railway and Electric Company; Great Falls Street Railway; York Railways; Tri-State Railway & Electric Company; Des Moines City Railway; Union Traction Company of Indiana; Knoxville Railway & Light Company; Georgia Railway, Light & Power Company; Reading Transit Company; Chattanooga Railway & Light Company, and Michigan United Railway.

Bureau of Safety, Inc., Chicago, Ill., has just organized and has sent out its first circular. In it is outlined the purpose of the bureau, namely, to conserve human life and to prevent needless physical and mental suffering by reducing the number of avoidable accidents. It also proposes to prevent needless loss of property by reducing the number of preventable accidents and fires. The plan of the special service offered by this bureau contemplates the formation of a practical scheme of safety work, and the assignment of properly qualified representatives for carrying out all the necessary details. The work of this repre-

sentative would include lectures, the systematizing of methods for reporting accidents and the resultant grading of departments in safety work, methods for keeping minutes of safety meetings and the disposal of recommendations made by workmen, and plans for future inspection of accidents and fire hazards. The bureau will also issue a monthly publication devoted to accident prevention, welfare and sanitation, which will be supplied to companies availing themselves of the services of the bureau. It is also prepared to counsel and furnish information with reference to general accident prevention or with reference to any special accident prevention problems. The bureau will make regular inspections of the physical and mechanical conditions of plants and submit recommendations and suggestions for improvement.

NEW PUBLICATIONS

Standard Handbook for Electrical Engineers, Fourth Edition. Prepared by a staff of specialists under the editorial direction of Frank S. Fowle. McGraw-Hill Book Company, Inc., New York, N. Y. 1984 pages. Leather, \$5 net.

The fourth edition of the well-known "Standard Handbook for Electrical Engineers" is practically a new work although it is based upon previous editions. The book is divided into twenty-five sections, each prepared by one or more specialists of international reputation. The sections from the old edition have been rewritten, simplified and rearranged in accordance with a more comprehensive editorial scheme, while entirely new sections on the following subjects have been added: Industrial motor application, electric vehicles, electric ship propulsion, mechanical engineering and general engineering and central station economics.

From the standpoint of the electric railway engineer the most important sections are those treating of electric railways, power plants, power transmission, properties of materials, and industrial motor applications. He will also find other sections, particularly that on units, conversion factors and tables of great reference value.

The section on electric railways was written by A. H. Armstrong, General Electric Company; N. W. Storer, Westinghouse Electric & Manufacturing Company; Azel Ames, Kerite Insulated Wire & Cable Company, and A. F. Ganz, Stevens Institute of Technology. One hundred and fifty pages are devoted to this subject, which is subdivided under three main heads; electric traction, railway signaling and electrolysis. The text on electric traction is a revision by Messrs. Armstrong and Storer of the former's section in earlier editions of the Handbook. It takes up the characteristics of railway operation, types of motors, braking, trucks and car bodies, self-propelled cars, electric locomotives, power distribution, distributing systems, etc. Mr. Ames gives an interesting general treatment of the intricate subject of signal systems, while Professor Ganz covers the much-discussed subject of electrolysis. In the last-named subject the bibliography is of particular importance.

The section of power plants is by R. J. S. Pigott, formerly mechanical construction engineer Interborough Rapid Transit Company, New York; A. T. Safford, consulting engineer, and G. I. Rhodes of White, Weld & Company. More than 200 pages are devoted to the subject and the elements of steam, gas, oil and hydraulic power plants are thoroughly covered. A special division is allotted to electrical equipment, and power-plant economics is also adequately treated. In view of the attention given to power plants in the Standard Handbook this subject was omitted from the electric railway handbook, recently issued by the same publishers.

It would, of course, be futile even to attempt to list the topics covered in the several sections, but the above illustrations will serve to indicate the general plan. In all sections particular attention is paid to definitions and bibliographical references and to useful typographical display. The total issue of the Standard Handbook to date is 35,000 copies, indicating the place which it occupies in the industries. Its many friends will appreciate the efforts of the editor and his collaborators, during two and a half years of continuous effort, in giving to the engineering profession what eight years of experience in publishing the Standard Handbook have shown to be the most useful data.

Electric Railway Journal

Consolidation of STREET RAILWAY JOURNAL JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, AUGUST 28, 1915

No. 9

THE SKIP STOP AS AN ECONOMY

Since the skip-stop idea has begun to take hold in the electric railway industry we have made several comments upon its time-saving features to the traveling public, and it might be proper to refer to the advantages that it offers as well to the railway companies. To this end it is, of course, necessary to make rather broad generalizations, for the possibilities of the skip stop vary through a wide range even on adjoining lines of a single property, but on this basis it may be said that the gain to the railway is an increase in schedule speed without necessity for any increase in the maximum running speed. This results in a proportional decrease in the number of cars required to do the work, which in turn directly reduces several of the items that comprise the operating expenses, most prominent among these being platform costs. According to the last census report the latter item alone constitutes nearly 30 per cent of the operating expense of the average electric railway, and as the same thing applies to the charges for power, amounting to some 18 per cent more, nearly half of the operating expenses are reduced proportionately to the increase in speed obtained by omitting stops, even neglecting the savings in inspection, insurance, superintendence, and the like, which must follow a decrease in the number of cars. Since the operating expenses average 60 per cent of the revenue, an increase of 10 per cent in schedule speed, which may be reasonably expected from the skip stop, will decrease at least one-half of these expenses by 10 per cent, resulting in a saving equal to 3 per cent of the gross revenue. This is almost one-third of the average net income for the street railways of the country, as shown in the last census, and it is an economy that is well worth the effort involved in its introduction.

MEETING OPPOSITION TO THE SKIP STOP

The proposed three months' trial of the skip stop on several lines in Milwaukee is a most encouraging sign that the time-saving idea is making headway. Of course, the fact that the Milwaukee authorities are consenting to a short trial by no means establishes a foregone conclusion that the skip stop will be permanently adopted, but it does provide an entering wedge which is bound to exert a future influence even if the present experiment fails to achieve popular support. This is an outcome that is by no means improbable in view of the experience in Denver. Here the skip stop was discontinued on one line by city ordinance, notwithstanding the result of a referendum vote that later showed 70 per cent of the affected householders to be

in favor of its retention, a popular petition resulting in its reintroduction some time afterward upon an adjoining route. In the first case the 30 per cent opposition was sufficiently bitter and sufficiently well organized to influence the local authorities regardless of the wishes of a non-aggressive majority, and this, no doubt, will be a prominent characteristic of the movement elsewhere. To meet it there seems nothing better than a long-continued reiteration of the facts regarding the loss in time that stops entail. For a railway line with a schedule speed of 8 m.p.h., and averaging ten stops per mile, the time spent in stops is of the order of two and one-half minutes per mile—no less than 33 per cent of the whole schedule. A skip-stop plan that saved even one-third of this to the passengers ought to be welcomed by them, and if they really understood the facts there is hardly a doubt but that the innovation would be welcomed.

FARE INCREASES AND REASONABLE RETURNS

It is satisfactory to note that the Massachusetts Public Service Commission has authorized another road in that State to charge 6-cent fares because at the former rate there had been an inadequate return on the stockholders' investment. Some interesting figures are also cited in the decision, showing the traffic before and after similar increases in fares on other roads. These figures show a falling off in number of passengers carried from 2 to 18 per cent in the seven roads mentioned. Of course this does not mean a loss in income; in fact, if the average fare increase in each case was 20 per cent or that from 5 cents to 6 cents it would mean an increase in practically every case. Nor can we assume that the increased fare is the only cause for the loss in traffic, although it might fairly be assumed to be an important reason. Presumably such a loss will be temporary only and until the community served becomes accustomed to the higher price. Then the traffic will resume its normal volume, and the beneficial effect of the rate increase will be appreciable. It may be assumed that there is a more or less fixed volume of traffic which is normal for a given community at a given time. Reductions in rates of fare cannot materially increase this volume nor reasonable increases reduce it permanently. At the same time it must be remembered that the traffic will only bear a certain charge which is set by conditions of competition, inherent value of the service, etc. Along with increasing rates of fare must go amelioration of the tax and other burdens carried by the utilities. When a company is practicing all possible operating economies and providing for the future by proper depreciation allow-

ances, and cannot make ends meet, it is justified in pressing for relief from financial loss in all directions practicable.

INTERNATIONAL ENGINEERING CONGRESS

Two hundred and thirty-nine papers in all are scheduled for presentation at the International Engineering Congress which is to be held in San Francisco during the week beginning Sept. 20. Of these, fifty-eight, or nearly 25 per cent, are from foreign countries, an indication that the congress will be truly international in character. England leads the list with fourteen papers and with her colonies, twenty-three; Italy follows with ten papers, France with six, the Netherlands with five, Sweden and Japan with three each, Argentina, Russia and Switzerland with two each, and Austria and China with one each. This is a good showing in view of the distractions to which foreign engineers are subjected at present. The topics favored by the foreign writers are municipal engineering, irrigation, railway engineering, electrical engineering, mechanical engineering, mining engineering, naval architecture and marine engineering, material of construction and waterways, in the order named.

On page 329 of the issue of this paper for last week attention was directed to the titles of some of the papers which are likely to be of great interest to electric railway men. These were selected from the programs of a number of sections of the congress. While there is no section devoted exclusively to electric railways, papers of interest to workers in this field will be delivered before several sections, such as those on railway engineering, municipal engineering, mechanical engineering, electrical engineering and metallurgy. Among the list of names of writers well known in the electric railway field are those of Sir Albert Stanley, general manager Underground Electric Railways (London, England); George H. Pegram and W. F. Reeves, engineers Interborough Rapid Transit Company; William Barclay Parsons, E. H. McHenry, H. S. Putnam and H. F. Parshall (London, England), consulting engineers, and Prof. L. Luiggi (Rome, Italy), former member Italian State Railway Board.

The subjects considered by these authors are also so varied as to include in a very comprehensive manner the general field of electric railway engineering. Thus, transportation methods, considered broadly, are represented by the papers of Sir Albert Stanley and Mr. Reeves, as well as by those on city planning and streets. Track and way questions are treated directly by Mr. Pegram and indirectly by the papers on electrolysis and electric welding by Professor Ganz and Mr. Auel; heavy electric traction by the papers of Messrs. McHenry, Eaton and Hood; power stations by those of Messrs. Parshall and Putnam and many papers on prime movers, boilers and station apparatus; and the broad problems of utilities in general by the papers of President Humphreys and Mr. Willis of England. These, of course, are in addition to the many other related topics in electric railway engineering which will be discussed by authors of international reputation.

Each nation wishes to be adequately represented in such a symposium of engineering progress, and loyalty to country as well as to profession furnishes an unusual incentive. We may therefore confidently expect that the publications of the congress proceedings will furnish a valuable epitome of the present status of engineering throughout the world.

COURT DECISIONS AFFECTING LABOR

A very useful publication has come from the bureau of labor statistics in the form of a review of 1914 decisions affecting labor. These cover at some length the many new workmen's compensation statutes, employment contracts, hours-of-labor laws, employers' liability and related subjects.

In reading the excellent summary that accompanies the decisions quoted, as well as in looking over the decisions themselves, employers will be forced to a realization of the fact (if they have not already reached this conclusion) that we are now living under a new body of laws and judicial interpretations so far as workmen's compensation is concerned. Under the Michigan statute, for example, it has been held that an employee who injured himself while running to punch the time clock when the noon whistles blew was entitled to compensation. The courts of the State have also held that a workman leaving a roof for lunch at the invitation of his employer and injured while coming down by a way of his own choosing, while other uninvited employees came down safely by another course, was within the protection of the act. The Wisconsin act was held to cover an injury to a workman on the way to the place of his employment. Compensation was allowed under the New Jersey act to a girl who was hurt while combing her hair to remove particles of wool acquired in the course of her employment in a mill.

A new twist in the fellow-servant doctrine, now modified or entirely changed by statute in several states, is found in a North Carolina case. There it was held that the incompetence of a fellow servant was the cause of the liability of the employer, the court stating that a workman assumed the risk of negligence of his fellow servant but not of the negligence of the employer in selecting incompetent employees. Extended and developed as many decisions of this character have been, it may readily become a rule that injuries resulting from what it is easy to show is the "incompetence" of a fellow servant are chargeable to the employer. Placing incompetents in positions where they endanger other employees is evidently as unsafe as it is indefensible.

One of the Supreme Court decisions reported emphasizes the value of this review to electric railway managers in particular. In this case (*Smith vs. Texas*) the court held unconstitutional a Texas statute restricting the employment of railroad conductor to persons of certain specified experience, it being decided that the requirements were arbitrary and unreasonable and so in violation of the fourteenth amendment. The application of this decision to laws which seek to prevent electric railways from employing non-residents or others who may be available during strikes is clear.

It is not so much, however, the direct application of many of these decisions to the railway business that makes this review of great importance; it is the insight given into the later interpretation of laws which change the whole structure of employers' liability and workmen's compensation, define the responsibility of labor unions (as exemplified in the Hatters' case and others) and put on a new basis such issues as were involved in the interpretation of the Kansas statute which sought to make it unlawful for an employer to require of employees that they should not be members of labor organizations. Justice Pitney's opinion in the latter case (*Coppage vs. Kansas*) is a veritable employers' bill of rights.

BROADER STANDARDS IN TRAINING MEN FOR PLATFORM SERVICE

The new schoolroom of the Brooklyn Rapid Transit System, described elsewhere in this issue, is a splendid example of effective co-operation between the transportation and mechanical departments of that company in broadening the instruction of platform men. Time was when a man was declared a full-fledged motorman or conductor on the strength of a week's platform training under men who knew but little themselves. In those days non-technical men in the transportation department were responsible for the curriculum, and but little thought was given toward achieving economical operation and avoiding the abuse of equipment. If the motorman made his schedules without accidents and if the conductor gave an honest accounting, no more was expected of them.

That these requirements must now be exceeded is evident from a survey of instruction practices devised during recent years. The skeleton car and dummy stand have been supplemented by complete floor layouts of the standard equipments so that each part can be inspected and explained in detail; simplified wiring diagrams and demonstration boards have been devised to show the course of current from trolley to rail in an interesting way; moving-picture scenarios have been written to point out the consequences of wrong and of right operation; tracks have been built for trial runs and, as at Brooklyn, even full-section car models and portions of track and line construction have been incorporated.

The elaborate equipment which has been assembled by the Brooklyn company is not for the purpose of making expert mechanics of the platform men, but to make them appreciate the correct use and value of the electro-mechanical equipment placed in their charge. If the new Brooklyn school will produce a larger proportion of men who can meet schedules without baking armatures and make stops without excessive use of brakeshoe metal, the money that the school has cost will soon prove well spent. Yet the excellent work that this school can do for the benefit of the mechanical department is but a trifle compared to the excellent results it can achieve in lower energy consumption, in decreased number of accidents and in fewer interruptions to the service.

DISARM THE YELLOW JOURNAL WITH FACTS

Newspaper reporters as a rule dote on the sensational side of any accident regardless of how trivial it may be, but after all they are human and generally have the layman's viewpoint. This was clearly demonstrated recently when two trains on the Elevated Railroads of Chicago came together in an insignificant collision at a point near one of the Chicago River bridges. An accident as slight as this would ordinarily have been instantly forgotten. Unfortunately, this trivial collision immediately followed the sinking of the steamer *Eastland* in the Chicago River, since which disaster the Chicago public has been working under a nervous tension that is reflected in every phase of the transportation business. Newspapers took advantage of this situation and emphasized the sensational side of this collision, dwelling upon what might have occurred if the river bridge had been open and the car had been pushed off the end of the structure.

Undoubtedly the yellow journalist made a deep impression upon his readers, but to counteract this President Budd of the Elevated Railroads immediately requested the manager of one of the prominent Chicago morning newspapers to send a reporter to examine the entire situation in detail. The request was granted and the reporter was taken in tow by the electrical engineer and the engineer of maintenance of way, and every phase of the accident was carefully explained to him. He was then taken to the site of the accident, where the various functions of the interlocking plants which protect all bridges were carefully demonstrated, as well as all the auxiliary protective devices which each plant controlled. Fortunately while the reporter was in the tower a signal indicating that the bridge was to be opened was received. This, of course, necessitated the sequence of operations required to protect traffic before the bridge could be turned from its normal position. As he watched these operations the reporter was deeply impressed with the great number of protective devices installed to safeguard the public. Armed with these facts he returned to his desk and worked up a half-column article in the usual sensational style. The sensational feature in this case, however, consisted in showing how mechanically impossible it was for a train to plunge into the river, and how untruthful were the reports contained in his competitors' newspapers.

This incident seems to indicate that when a newspaper is not obsessed with the idea of disparaging public utilities in general, the reporters and editors are open to conviction. It is certainly a good policy for the railway managers to devote sufficient time and attention to furnishing newspaper reporters, and in turn the public, with the facts. It is particularly important that these facts be presented so as to be clearly understood by the layman. As a rule a layman is more easily convinced by a demonstration, and undoubtedly so it is with newspaper reporters, who cannot always be expected to understand a technical description given from the office desk. The reporter is liable to construe such a technical description as "bunk" and proceed to write a sensational story drawn from his own imagination.

A Modern Railway School

In the New Surface Car Schoolroom of the Brooklyn Rapid Transit System the Operation and Equipment of Each Important Type of Car Is Taught by Means of Full-Section Models—Moving Pictures and a Miniature Trolley-to-Rail Demonstration Board of Original Design Are Among the Instructive and Interesting Features

The Brooklyn Rapid Transit System completed this past spring, after nine months' work, a most extensive and modern surface railway school, chiefly for the instruction of platform men. The location of the old school, at Fifty-eighth Street and Second Avenue, was retained on account of the facilities on Second Avenue for the road instruction of the men in connection with their work at the school. The new school occupies approximately three times the space of the former school, or more than 5000 sq. ft. of floor space. It comprises a conductors' room, motormen's room with apparatus, and the office of the supervisor of instruction.

The installation is most attractive and substantial, all layouts being of steel as far as possible, while all wiring is inclosed in conduit pipe.

As first impressions are often lasting, the very entrance to the school has been laid out in a way that will place the students in a friendly and receptive mood. On entering the office of the supervisor of instruction they will see some tastefully-grouped photographs which illustrate different features of B. R. T. employees' welfare work. Here, for example, they see the interiors of the several welfare centers with their restaurants, reading rooms, pool tables, bowling alleys, electric driers for clothing, etc. Thus they are impressed with the fact that the relations with their future employer will have human as well as business aspects. Groups of safety campaign pictures framed uniformly serve to impress the new men that the physical well-being and consequently the happiness of many passengers will lie largely in their care.

BROOKLYN SURFACE CAR SCHOOL—INSTRUCTION SLIDE TO SHOW POSSIBLE DANGER OF FORBIDDEN TALKS

BROOKLYN SURFACE CAR SCHOOL—INSTRUCTION SLIDE SHOWING HOW CONDUCTOR CAN AID PASSENGERS

The new school is the result of co-operation of the operating and mechanical departments throughout, William Siebert, superintendent of transportation, designating E. C. Clarke, supervisor of instruction, in charge for the operating department, and W. G. Gove, superintendent of equipment, designating O. T. Kreusser as engineer in charge for the mechanical department, to design and care for the work involved.

All construction was handled by the company, the engineer of way and structure caring for the remodeling of the building and heating, the line department for the illumination, and the Fifty-second Street surface shops for the makeup and installation of the equipment and apparatus.

The stationary equipment hereinafter described is to be supplemented by a specially designed and equipped instruction car which will be operated over the system on regular schedule, for any specific purpose or for any reinstruction found necessary at the different operating depots.

As each class of motormen or conductors is taken in hand by the supervisor of instruction he addresses them briefly on the scope of their duties, on the possibilities of their future career, on the functions and value of the Employees' Benefit Association, and on the need for safe operation and courteous treatment of their patrons. The classes then go to their respective rooms for the instruction hereinafter described.

CONDUCTORS' ROOM

The room for conductors is equipped with fifty-four benches and desks of the public school type. It is devoted chiefly to instruction in fare collection, in the preparation of reports, and in such other matters as cannot be demonstrated on the full-section car models in the motormen's room. As accompanying views show, the conductors' room has no other mechanical apparatus than two frames with cash and transfer registers thereon, including ringing devices. The use of signal bells and cords is also shown. The register frames are

BROOKLYN SURFACE CAR SCHOOL—INSTRUCTION SLIDE
SHOWING HOW A WAGON MAY OBSCURE VIEW OF
PLAYING CHILDREN

BROOKLYN SURFACE CAR SCHOOL—INSTRUCTION SLIDE
SHOWING CONDUCTOR'S CORRECT POSITION
WHEN PUNCHING TRANSFERS

mounted on the instructor's platform at the front of the room. Behind him and on part of the side walls are blackboards. Enlargements of the principal report forms used by conductors, such as the day sheet, general time slip and car-service time slip, are painted on part of the side wall blackboards to permit the instructor to illustrate his talk. The use of other forms, such as accident reports, is also illustrated and taught to the men.

In addition to the instruction of this formal character, a more attractive and unusual form of teaching is afforded by the use of a series of stereopticon slides, the room being equipped with a stereopticon machine and spring roller curtain. These slides show enlarged views of the register dials, the correct positions that the conductor should assume in registering fares, in issuing transfers and in assisting passengers to enter or alight. The slides also illustrate the need for constant watch of street conditions to avoid accidents to persons and collisions or side-wipes with vehicles. Moving pictures of the same tenor, including the now famous "Price of Thoughtlessness," are also used.

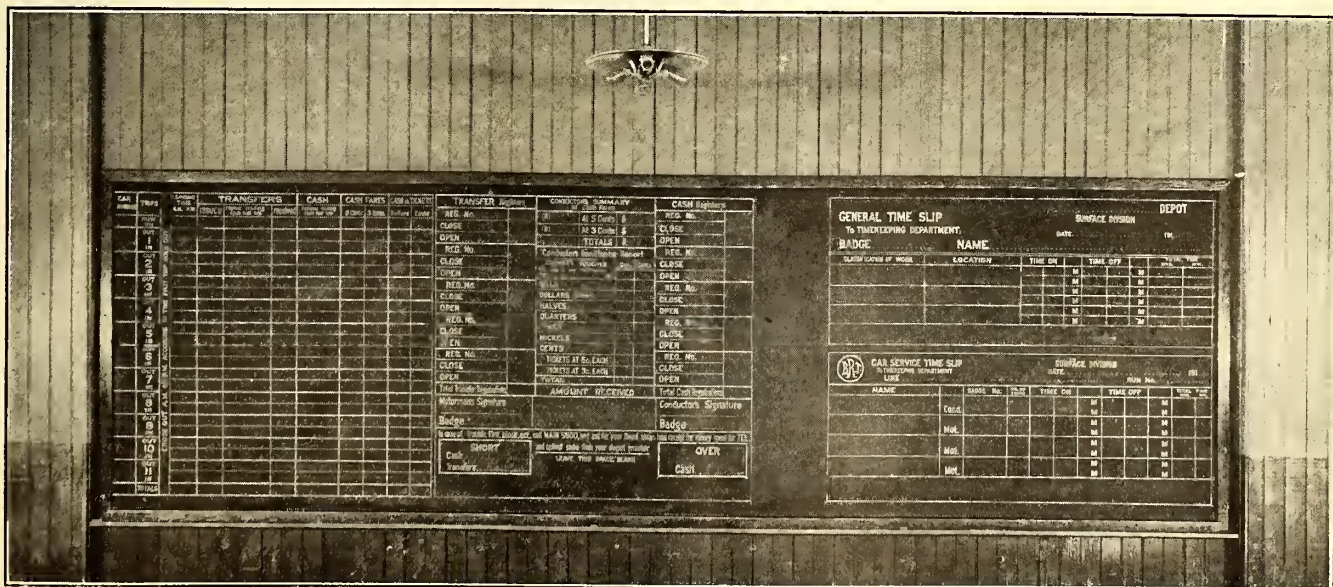

Although, as noted, the embryo conductors can be handled up to classes of fifty-four, the instructor does

not remain constantly on the platform or at the blackboards but is always prepared to give individual instruction to the more backward students. Moreover, all the pupils are supplied with a series of pamphlets whereby they can refresh their memories of the knowledge gained in the classroom.

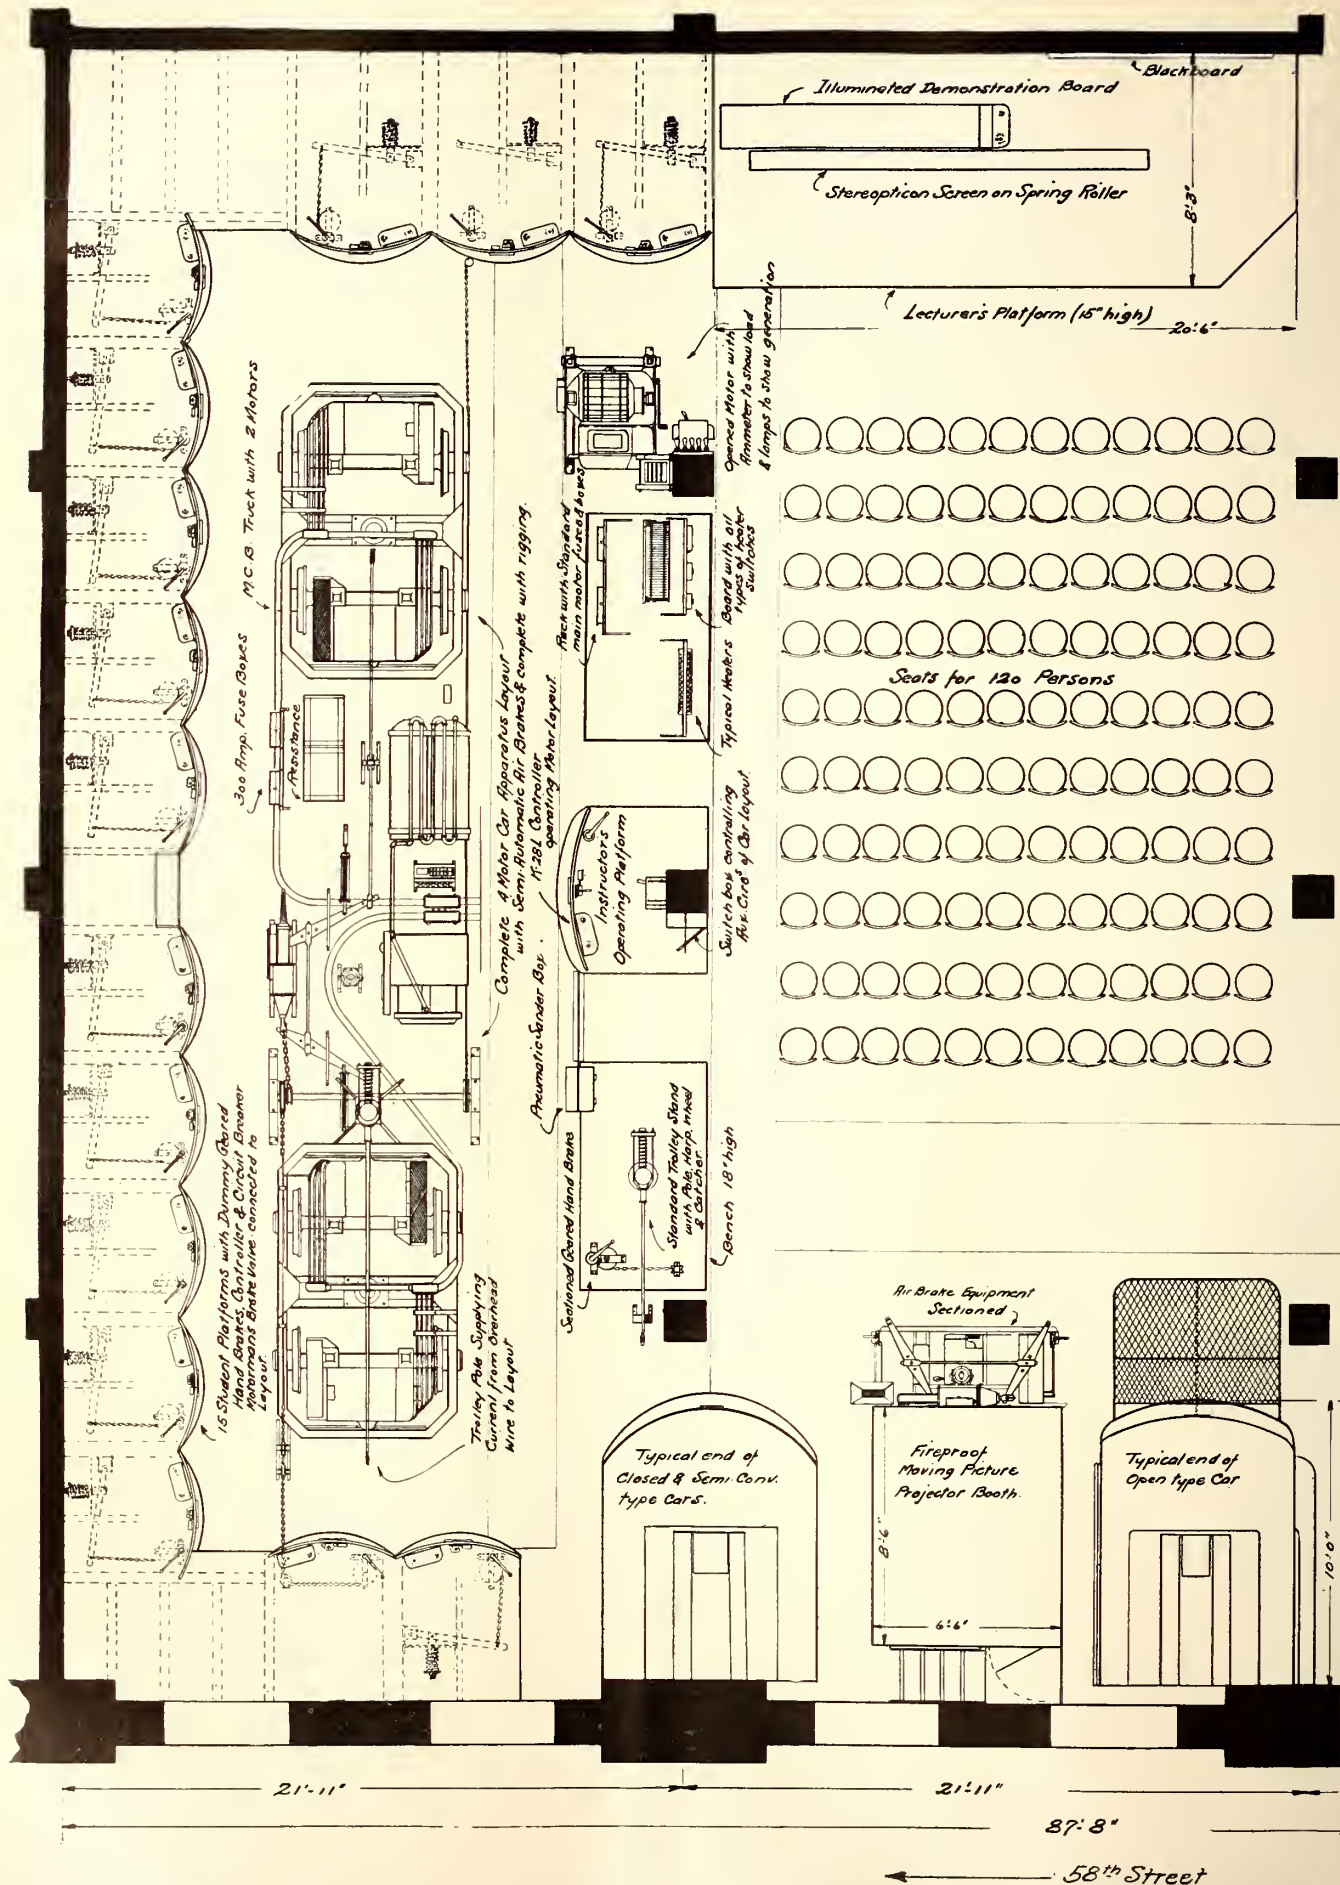

MOTORMEN'S ROOM

As the recruit motormen and conductors enter the motormen's or apparatus room, they are likely to be bewildered by an array of car equipment so extensive that it looks like an electric railway convention exhibit on but a slightly reduced scale. Yet, a few minutes' inspection will convince the visitors that they have before them an attractive as well as an instructive array of apparatus and equipment. In fact, news of the very elaborate outfit of this school has brought to the room many car platform veterans who have come on their own time to get a clearer idea of the apparatus that they handle every day. On a recent day, for example, 120 regulars visited the school.

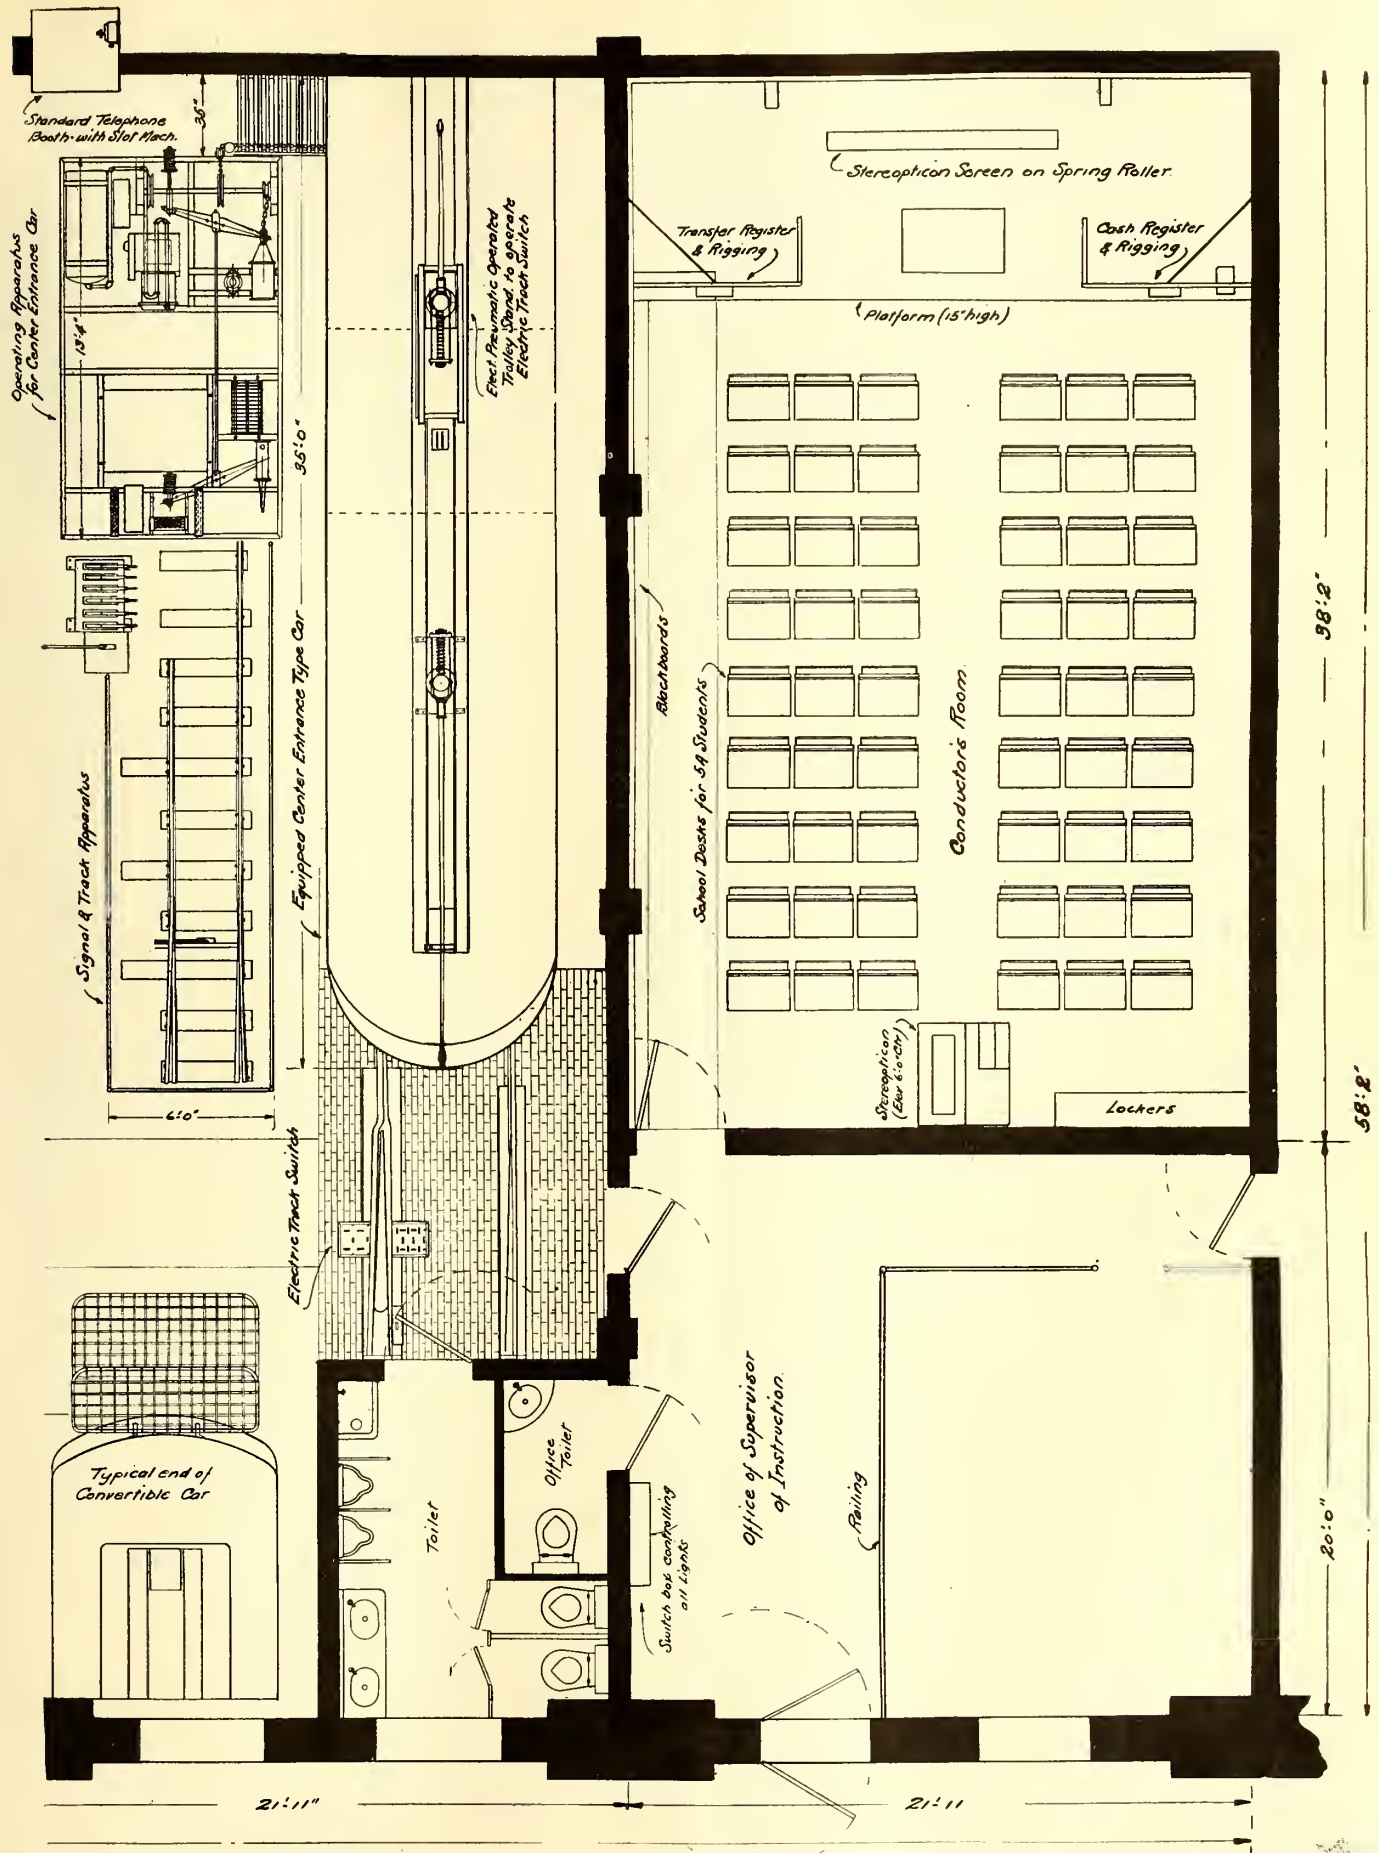

The motormen's room contains all the working apparatus, equipment and car sections beside the audi-

BROOKLYN SURFACE CAR SCHOOL—CONTACTOR AND OTHER EQUIPMENT ALONGSIDE CENTER-ENTRANCE CAR

torium, which has individual seats for 120 persons, a lecturer's platform and a moving picture booth and equipment for illustrating lectures.

FULL SECTION CAR MODELS

As shown on the accompanying plan, immediately on entering the room the visitors will observe at their left a series of three full-size sections of the general types of drop platform cars used in Brooklyn, comprising the cross-seat convertible four-motor type car, the semi-convertible closed two-motor type car, and the open car. Each model is 10 ft. long, so that it comprises not only a complete and operative vestibule but has also enough interior to show the seating arrangement, the location of register mechanism, signal cords, the position of the sand box, transfer box, heater switch and positions of most company announcements; also all bulkhead fittings, including curtains and the door mechanism. In the case of the convertible car, one side is shown with summer sash and the other with winter sash, while the open car has the regulation standard running boards and guard bars which can be raised and lowered. This car also has a composite platform equipment, representing the heavier open cars which have air brakes and pneumatic sanders in addition to the standard geared hand brakes, while the lighter cars of this type are without air brakes and have mechanically-operated sand boxes.

While, of course, the models are not movable, the

vestibules and platforms are fitted with every part of the equipment in its standard location, such as the switch boxes, controller brake staff and ratchet, brake valve, conductor's emergency valve, record card holder, etc. Many of the items bear metal signs to accustom the men to call things by their proper names so that, for example, a man will not refer to a contrivance as a wheelguard when he means a fender. The drills which the recruits receive on these models help to teach them their proper position on the cars and the correct operation of controllers, brakes and circuit breakers, closing or fastening of platform gates, adjustment of fenders and wheelguards, and the use of the switch irons, foot gong, conductor's emergency valve, etc., also the proper position and methods for the registration of fares and the transmission of signals.

The wheel-guard equipment has also been comprehensively covered, showing the two different types used in Brooklyn, and demonstrating their operation and the proper use of the emergency hooks during heavy snow storms, or when the guard becomes damaged. The two standard types of fenders also are shown, and instruction is given in their proper handling. The proper location and use of drawbars are also covered.

THREE-QUARTER MODEL OF CENTER-ENTRANCE CAR

To teach the men the use of the center-entrance car it was deemed desirable to build a three-quarter length, full-section model of the body in order to include the en-

BROOKLYN SURFACE CAR SCHOOL—REAR OF THE AUDITORIUM, SHOWING THREE FULL-SIZE SECTIONS OF CARS AND THE MOVING PICTURE BOOTH

BROOKLYN SURFACE CAR SCHOOL—SIDE VIEW OF THREE-QUARTER LENGTH CENTER-ENTRANCE CAR SHOWING LAYOUT OF EQUIPMENT ALONGSIDE, SPECIAL TRACK AND STUDENTS' STAIRWAY AT THE REAR

tire well construction and the ramps leading therefrom. In short, this model, which is built of steel, is a faithful replica of an actual car except that a portion of the seating is absent to give room for class instruction and to permit the exposure of the electropneumatic operation of the doors. Further, the working of the door-operating mechanism by hand or air is visible through the screens which replace the usual steel casing at this point, and a portion of the ceiling remains open to show the duct and fan motor used in the vacuum ventilating system.

Unlike the other models, this car is equipped with all the electrical and pneumatic apparatus connected and working. However, all the equipment ordinarily used

under the cars and consisting of the contactor box, resistors, relays, air compressor, governor, tanks, brake cylinder, slack adjuster, brake rigging, etc., is installed beside the car on the floor in approximately the same relative positions that the parts have under the operative cars. This permits ready inspection and examination. Following the practice applied throughout this room, each piece of apparatus is neatly finished in light colors and bears a metal sign with its name or identifying number, like the following: "Contactor Box"; "Air Reservoir, Drain Cocks and Safety Valve"; 1—"Control Resistance," 2—"Control Relay," etc.

The roof of the car is equipped with two trolley poles connected as in service, the entire equipment obtaining

BROOKLYN SURFACE CAR SCHOOL—THREE-QUARTER LENGTH MODEL OF CENTER-ENTRANCE CAR WITH AUTOMATIC TRACK SWITCH IN FRONT AND SIGNAL MECHANISM ALONGSIDE THE FRONT HALF OF THE CAR

its current from a standard trolley wire overhead. The rear pole in addition has a sliding device, used in connection with the electric track switch located ahead of the car.

In the case of the center-entrance car, therefore, the equipment is operated from the cab in such fashion that when the students are on the floor they can see what takes place in the main control and braking apparatus. Further, they can see the workings of the several safety relays which prevent opening of doors when power is applied as well as the opening of the control current when doors are open. Other operations observed by the pupils are fare collection, door operation, response to door and buzzer signals, automatic control of heaters by means of the thermostat, proper use of switches, replacement of fuses, etc.

TRACK SWITCH AND SIGNAL INSTRUCTION

The use of the electric automatic track switch is taught in connection with the operation of the center-entrance car equipment. A suitable area in front of this car is paved and equipped with a complete operating electric track switch. Placed on the wall to face

cars are operated over elevated tracks. As one of the illustrations shows, the equipment includes a dwarf signal, two-arm semaphore and switch levers with mechanical locks.

DESCRIBING THE COURSE OF THE CURRENT

The demonstration board which has been devised to show the course of the current and the operation of the control equipment from the point of entrance at the trolley wire to the point of return at the rail, is most ingenious and instructive. It is built of steel and ebony-impregnated asbestos and is placed in the front of the auditorium section on the lecturer's platform.

The accompanying illustration of the front of the board shows that it is laid out for a two-motor equipment with the usual appurtenances in miniature, all suitably designated. The energy for operating the devices on the board and for its lighting effects, is obtained by means of the trolley wire on the board and a standard K-11 controller with a special geared supplementary drum, carrying twenty-five fingers.

It will be seen that by use of the trolley cord a miniature trolley pole and stand of metal can be put in or

BROOKLYN SURFACE CAR SCHOOL—MODEL BOARD SHOWING THE COURSE OF CURRENT FROM THE TROLLEY TO GROUND

the motorman is the standard warning sign "Electric Switch—100 ft.," used in connection with automatic switches. As the car itself cannot be moved, the rear trolley stand and pole are moved to produce the same condition that arises when the current collector of a moving car enters the insulated section of the overhead contactor which is used in operating the automatic switch. The trolley stand is mounted on a ball-bearing track and returns to its normal position automatically. This movement of the trolley stand is obtained by means of electropneumatic mechanism similar to that of the center doors. This mechanism is operated by the instructor from a push button in the cab.

The students are shown that for straight rail the car must be run over the switch without power, while for taking the switch they should apply power only on the first point of the controller. The instructor meanwhile presses the button provided, which causes the trolley pole to move past the contactor located on the trolley wire and to cause the track switch to throw automatically. Of course, the proper throwing of switches by hand is also taught.

A portion of the space alongside the center-entrance model is employed for an exhibit of the signals which are used on those portions of the system where surface

out of contact with the strip of copper which is the source of all power supply. When the main switch is in, energizing the trolley wire and the trolley wheel placed against the wire, small cut lenses are illuminated at the trolley pole and stand, showing the live condition of these parts. When the circuit breaker is cut in, the lamp at that point is lighted as well as the one at the fuse box, and when the controller is opened the slots representing the trolley fingers are also illuminated, showing the live condition of all the various apparatus to that point.

Near the base of the board are cross-sections of two four-pole motors which are also arranged with lenses illuminated to various intensities. The shafts of these sections are extensions of the shafts of real motors installed behind the board. Each extended shaft carries a pinion which meshes with a corresponding gear. As the controller handle is turned, the slots inside the miniature controller are illuminated showing the various combinations of connections in the controller and the motor armature and gearing. The connections made in the real controller at each notch and the path of the current through the real, though concealed, resistors are ingeniously shown in the miniature controllers (the covers of which are hinged) by adapting the punctured-

roll principle of automatic piano players and by throwing lamps in or out of circuit by means of the contacts on the supplementary drum.

This third drum in the operating controller is used to secure the lighting, current flow and heating effects shown on the front of the board. When so employed, several banks of lamps behind the board are placed in circuit, but their illumination cannot appear on the front of the board because intervening brass screens cut them off from all openings. These brass screens, however, are perforated at such intervals that at each notch of the controller the various slots, of which there is one for each controller finger, are either covered, shutting off the light, or uncovered, permitting light to shine through and show the "live" condition. The screens are moved mechanically by means of a pinion and rack which is actuated through gearing on the K-11 controller. The slots representing the fingers have their connections painted and lettered so that the path of the current from the energized fingers can be readily traced out to the main cable through the resistors and motors. By the use of red lamps behind the miniature resistors a simulation of their heating is obtained, each point of resistance having a separate screened lamp put in or out by means of the supplementary drum at the proper time. The board is operated directly on the regular 550-600-volt circuit, and the lamps used are 23-watt and 10-watt, with five or more in series.

The demonstration board is supplemented by a diagram on which the circuits and apparatus are shown in heavy white lines against a faint outline of a two-motor car to indicate the position of each piece of apparatus on the car. The diagram also bears the necessary explanatory words and phrases to make it as clear as possible.

A modern moving picture and stereopticon equipment with a steel and asbestos booth placed between two car

BROOKLYN SURFACE CAR SCHOOL—DETAIL VIEW OF BOARD, SHOWING INSIDE OF MINIATURE CONTROLLER, GEARING AND SECTION OF MOTOR

models and elevated above the floor is another feature of the auditorium section. The special resistors necessary to reduce the 550-600-volt current are located in a housing under the booth and these, as well as the booth, are ventilated by means of a duct. A buzzer circuit enables the lecturer to signal the picture operator concerning changes in slides or films. A large spring roller curtain for images up to 12-ft. square is provided over the lecturer's platform for use with the stereopticon equipment.

DEMONSTRATING MOTOR

At the left of the instructor's platform is an opened GE-800 motor with a K-11 controller, standard resistors, circuit breaker, ammeter and bank of lamps above the breaker. A foot brake and brake drum are provided to demonstrate with the help of the ammeter how the energy consumption of the motor is increased when it is running against brake friction.

As this motor is open the explanation of the function of its various parts is understandingly made. This motor is also arranged to be operated as a generator by permitting the armature to spin and then throwing the circuit breaker and reversing the controller. Visual evidence of generation is afforded by means of the lamp bank which is momentarily lighted by the current generated. The brush-holders and revolving armature as well as all resistors are protected to prevent anyone making contact with them.

HEATERS, FUSES AND OTHER DETAILS

Directly in line with the demonstration motor is a rack showing the company's different types of heater switches, with and without covers. These are used to teach the correct way of cutting heaters in and out in operation. On the same stand and in electrical connection with the switches are one cross-seat and one panel heater.

On the opposite side of the same stand are mounted a group of 150-225-300-amp cartridge and one-ribbon type of motor fuse. Here the students are shown how to insert fuses correctly and to distinguish between the different sizes.

Boards are also provided on the columns for carrying the controller and air-brake handles used for the

BROOKLYN SURFACE CAR SCHOOL—TEST EQUIPMENT WITH AMMETER AND BANK OF LAMPS TO ILLUSTRATE USE OF MOTOR AS A GENERATOR

BROOKLYN SURFACE CAR SCHOOL—INSTRUCTOR'S PLATFORM WITH PORTION OF OPERATING FOUR-MOTOR EQUIPMENT

students' dummy platform outfits hereinafter mentioned. Each handle is stamped with the number of its location, partly for convenience and partly to inculcate the student's mind with the absolute need for orderliness.

Another display bench, 18 in. high, carries a complete current-collecting outfit made up of a trolley base, pole, harp, wheel and catcher. The instructor shows how emergency repairs can be made to current collectors quickly and safely. The same bench has a geared hand brake which is standard for Brooklyn cars, cut in section to show the features of its design, and a pneumatic sand box in operating condition.

A more elaborate detail equipment is that of a complete semi-automatic surface-car air-brake equipment with live and dead levers, connecting rod, pneumatic sand box, slack adjuster, etc. All the apparatus and

BROOKLYN SURFACE CAR SCHOOL—DISPLAY OF DIFFERENT STANDARD TYPES OF FUSE BOXES

pipings are cut in section so that the instructor may describe the internal operation and connections. This equipment is used not only for the enlightenment of platform recruits but also for men from the maintenance forces of the company.

DRILL PLATFORM INSTRUCTION

For instruction in the correct handling of controllers, fifteen drill platforms have been equipped with dummy geared hand brakes, controller, circuit breaker and foot gong, but with operative motorman's brake valves. The stands are so placed that all members of the class at drill can see every move of the instructor, whose own stand comprises operating equipment throughout. Between the instructor and his class is installed a complete four-motor car apparatus layout, including semi-automatic air brakes, whereby the instructor demon-

BROOKLYN SURFACE CAR SCHOOL—SPECIMENS OF THE DIFFERENT STYLES OF HEATER SWITCHES AND HEATERS USED ON SURFACE CARS

BROOKLYN SURFACE CAR SCHOOL—SECTIONALIZED AIR-BRAKE AND PNEUMATIC-SANDER EQUIPMENT

strates the different features of controller and brake operation.

The trucks of the M. C. B. type are raised off the floor and are equipped with two GE-800 motors, each of which has been rewound for slow speed since they are run without load. They operate with noiseless fiber pinions. As the air brake is operative from the valves on all sixteen platforms, a compressor of extra large capacity is used. The brake equipment consists of governor tanks, cooling coil, emergency valve, brake cylinder, slack adjuster and conductor's valve completely connected with the standard foundation rigging right to the trucks.

To simplify instruction the following features have been incorporated: Different colors for the various circuits and air pipes; illumination for each point of the screened resistors to show what resistance grids are in

circuit; a double-face gage on the brake cylinder to show the entire class how much air has been used in different applications; a turnbuckle in one of the pull rods to illustrate the working of the slack adjuster; a system of double-faced signs to designate properly every device; a complete car circuit of lights to illustrate the distribution of the different lamps of each circuit.

As most Brooklyn cars are equipped with semi-automatic air brakes and pneumatic sanders, instruction in their safe and economical operation receives much attention. The instructor, therefore, takes special pains to show the danger and waste inherent to excessive use of air, particularly by making needless emergency applications, as well as the proper methods in applying and releasing brakes so that smooth and efficient stops will be obtained.

INSTRUCTION IN TELEPHONING

To educate the students in the correct use of the telephone, a standard pay station with slot machine has been installed. This outfit is connected with a telephone in the outer office so that a regular conversation can be conducted. The need for instruction of this kind, even on city systems, is illustrated by instances where excited platform men have called up headquarters for a wrecker or other service but before hanging up the receiver have failed to mention the place where succor was needed.

OVERHEAD AND WAY SIGNS

To familiarize the recruits with the overhead and way signs, standard steel placards are suspended from span wires bearing such markings as the following: "Trolley Station"; "Cars Will Not Pass On This Curve"; "Section Insulator—Shut Off Power"; "Theater Stop"; "School Stop" and the arrow signs which are placed at intersections to show what lines have the right of way. The meaning of the different signs is explained to the men during their course of instruction.

Another Massachusetts Fare Increase

The Public Service Commission Grants a 6-Cent Fare to the Norfolk & Bristol Street Railway—The Reason Given Is "Inadequate Return on the Stockholders' Investment"

The Massachusetts Public Service Commission issued a decision on Aug. 19 granting to the Norfolk & Bristol Street Railway authority to establish a 6-cent fare unit upon its lines, in accordance with the petition of the company addressed to the board on March 12, 1915. The present cash fare is 5 cents. The company further desired to charge 1 cent per transfer issued, but the board refused to allow this. The decision is the third of its kind within a year, the Middlesex & Boston Street Railway and the Blue Hill Street Railway being the other companies to receive fare increases according to a well-defined policy of the commission, which recognizes the importance of additional revenue in cases where the petitioner demonstrates its necessity.

The main line of the Norfolk & Bristol runs from Norwood through Walpole, South Walpole and Foxborough to Mansfield, with a branch from Foxborough to Wrentham and a shorter branch from Walpole to East Walpole. This main line substantially parallels lines of the New York, New Haven & Hartford Railroad, the total trackage covering 22.02 miles. All but 0.5 mile is in the public streets.

In brief, the company's petition asked:

1. To make the cash fare 6 cents within the limits of any fare zone.
2. To charge 1 cent for every transfer issued.
3. To sell ticket books containing fifty tickets each at \$2.75 and books of 100 tickets for \$5.50. At present there are no tickets of this kind, but on certain routes round-trip tickets are sold at 15 cents under restrictions.
4. To sell for school children, entitled by law to half-fare transportation, special ticket books containing thirty-four tickets for \$1 and strips of ten tickets for 30 cents. At present strips of ten tickets are sold for 25 cents.
5. To issue transfers on the East Walpole branch between Lake Avenue, Walpole and the Norwood town line, and vice versa, for a single fare plus the 1-cent transfer charge.
6. To establish fare limits providing for one zone on the Wrentham branch with no transfer privileges, and to eliminate the zone between the Foxborough-Walpole and the Foxborough-Mansfield town lines.

After presenting the petition, the company, in conference with citizens of the affected towns, agreed to modify the proposed schedule as follows:

In addition to the ticket books and school tickets, the company proposed to issue strips of ten tickets for 50 cents, good for one ride within any fare limit when tendered at a point which the car is scheduled to pass before 8.30 a. m., and between 5 and 7 p. m.

The company estimated that the changes proposed would, if allowed, and if no decrease in traffic resulted, produce about \$10,000 additional revenue per year. The total operating revenue for the year ending June 30, 1914, was \$93,978.

The company is the successor of the Norfolk Southern Street Railway, organized in 1897 which went into a receiver's hands in 1899, with liabilities at the time of \$493,000. The road was sold in 1901 to a syndicate including the National Shawmut Bank, Boston, and other concerns. The total investment of the syndicate was \$303,670, in March, 1902. The Norfolk & Bristol company was organized in 1901 and purchased the road from the syndicate for \$345,000. It appears that the amount of stock and debts of the new company exceeded the replacement cost of the property by \$8,000. A part of the property was also involved in the claims of other parties supplying rails and car equipment, totaling about \$21,000. In 1908 the company effected a cancellation of liabilities amounting to \$147,168 by agreement of note holders in order to float a new bond issue. Since 1904 the present management has been in charge. Up to the present there has never been a fare increase, due in part to the 5-cent fare provisions in some of the original grants of location. The population of the territory increased from 19,044 in 1900 to 28,721 in 1915, a gain of 50.8 per cent. The respective towns on the system have the following populations by the 1915 State census: Norwood, 10,970; Walpole, 5478; Foxborough, 4115; Mansfield, 5765; Wrentham, 2393. No freight or express business is conducted.

OPERATING RESULTS

Since the beginning of operation the property has had a total operating revenue, to June 30, 1915, of \$1,003,012; operating expenses, \$848,726; net operating revenue, \$154,286; miscellaneous income, \$2452; gross income less operating expenses, \$156,739, with a deficit in net divisible income of \$18,191. The only dividends paid have been two of 3 per cent in 1912 and 1913. Earnings have been falling off since 1913, the gross operating revenue then being \$96,007 against \$88,435 for 1915. The accumulated deficit is \$30,191. The total assets are \$488,714, and the company has a capital stock of \$200,000 and funded debt of \$200,000, with no outstanding notes. Since the date of the last bond issue (1909) permanent additions have been made to the extent of \$30,009, taken from surplus earnings.

The book value of the permanent property is only \$21,627 per mile, a low figure in comparison with other Massachusetts companies. The engineering department of the board estimates the cost of the property at \$449,837, or only \$24,000 less than the total permanent investments reported in the company's balance sheet. The board holds, as in the Middlesex & Boston and Blue Hill cases, that the capital honestly and prudently invested must, under normal conditions, be taken as the controlling factor in fixing the rates, and sets forth \$400,000 as the amount upon which the return should be calculated, in view of the fact that the failure of the company to make adequate provision for depreciation does not appear upon the evidence to be due to the payment of unwarranted dividends or to mismanagement.

The income record of the company from 1909 to 1915 inclusive shows a net divisible income ranging from nothing to 6 per cent on the stock and averaging 3.27 per cent over and above operating expenses and fixed charges. The commission states that "as they stand, these figures indicate an inadequate return on the stockholders' investment," but before determining the need

Lines of NORFOLK & BRISTOL STREET RAILWAY

of additional revenue, the board considers a study of the operating expenses essential. This study shows that the company's officers have devoted part time to the management of the Norwood, Canton & Sharon Street Railway, operating 6 miles of track in adjacent territory, and the Norfolk & Bristol road rents equipment to the former at 1.5 cents per car-mile, while it actually costs the Norfolk & Bristol Street Railway at least 2.8 cents per car-mile for maintenance. Pending an agreement no bills have been rendered the Norwood, Canton & Sharon. The commission points out that the companies should reach a speedy agreement, effect a prompt settlement and adjust their relations on a definite cash basis for the future, so that the true operating expenses and income may appear. Such agreements, in the opinion of the board, should be in writing, and notice to that effect will be sent by the commission to all the operating companies in the State. Other criticisms are directed toward the company's methods of accounting, with the recommendation that an experienced bookkeeper be placed on the payroll instead of calling upon outside assistance. It is also held by the board that if the company's automobile equipment is confined to an existing runabout and a motor truck, eliminating from its expense account two touring cars garaged at the manager's residence in Boston, about \$1,750 per year can be saved. A comparison is made in the decision of the company's accounting and of the expenditures as determined by the Interstate Commerce Commission classification, adopted in 1914. Issuance of vouchers in more detail is also emphasized as desirable.

MAINTENANCE AND DEPRECIATION

An analysis of the maintenance expenses indicates that on the whole adequate provision has been made for this purpose. Until 1915 the company had accumulated no depreciation reserve, as such, when \$2,167 was so charged. The board points out that the rough rule of allowing 20 per cent of operating revenue to cover maintenance and depreciation is particularly questionable when applied to a small road with relatively low gross earnings. The commission finds that despite the fact that the company, out of its total net earnings has paid only \$6,000 in dividends to its stockholders and has apparently turned back more than \$30,000 into the property, it appears that the property may have depreciated in value to the amount of nearly \$110,000 as compared with the investment of \$400,000. Says the board: "The accumulation of a depreciation reserve or surplus fund equal to the entire amount of the estimated depreciation is perhaps more than good business policy necessarily requires; but the evidence demonstrates, we think, that while the Norfolk & Bristol has made some provision for depreciation, it has not made due provision."

NEED OF INCREASED REVENUE DEMONSTRATED

The inspection department of the board estimates about \$14,000 as the average expenditure which should henceforth be made each year for several years in order to maintain tracks and overhead structures in a safe and proper condition, and about \$11,000 for maintenance and depreciation of equipment. It appears that for the past two years, if the company had expended \$25,000 a year for maintenance and depreciation, it would have shown a deficit during that period of \$2,263. In order to make up this deficiency and to permit of a 6 per cent return to its stockholders, says the decision, the company must show an increase of more than \$13,000 over its average net earnings for the past two years. With the possible economies in operation indicated the company would appear on this basis to be entitled to an additional revenue of something more than \$10,000 a

year. The evidence does not indicate that the return to the stockholders, allowing for depreciation and an accumulation of proper surplus funds, would have been adequate if earnings had been more nearly normal, considering the effect of the financial depression. With a steady increase in population in the territory served and improving business conditions and with economies in operation or management it is possible, the board holds, that the company could in future earn an adequate return without an increase in rates; but the commission upon the evidence states that it would not feel justified in refusing an increase because of such speculations. The opportunity to reduce rates at any time if earnings prove excessive is always open. Upon the evidence, therefore, the commission finds that the need of additional earnings has been demonstrated.

EFFECT OF 6-CENT FARE ON TRAFFIC

The company's estimate of about \$10,000 increased revenue from the proposed changes in fare and zones, transfer charge and tickets, is based on the fares collected in 1914, and is made up on the assumption that the changes will not produce a decrease in traffic. The board calls attention to evidence that this assumption is likely to prove incorrect by the following table of revenue passengers carried by seven Massachusetts electric railways in the year before and in the year after the change was made:

Company	Revenue Passengers Carried	
	Before 6-cent Fare	After 6-cent Fare
Blue Hill	1,680,543	1,525,154
Boston & Worcester	11,143,040	10,481,902
Brockton & Plymouth	2,255,320	1,856,723
Concord, Maynard & Hudson	1,146,088	969,621 ¹
Connecticut Valley	3,714,765	3,357,857 ²
Lexington & Boston	2,766,618	2,688,114
Newton & Boston	1,402,385	1,313,947

¹ Five months at 5 cents, seven months at 6 cents.

² Three months at 5 cents, nine months at 6 cents.

While there may have been other contributing causes in certain cases, the table supports the theory that a 6-cent fare decreases traffic. The board considers that the company's estimates are on the whole reasonable. These assume that 40 per cent of the passengers will use the workmen's tickets in the morning and evening, and that 25 per cent of the remainder will use the 5.5-cent tickets.

APPROVAL OF INCREASED FARE

So far as the essential features of the petition are concerned, except with regard to a transfer charge, the board approves the proposed new schedule. Transfers are not to be issued at an additional charge, the board holds, because the total length of ride which can be secured with the use of a transfer is no longer than can be secured on other parts of the system, where cars are routed through.

Relative to the sale of tickets, the commission holds that the company should issue books containing eighteen tickets for \$1, so that regular patrons may have the opportunity, upon payment of a comparatively small sum, to secure transportation at a somewhat lower cost than the transient rider. The use of ticket books containing fifty rides for \$2.75 is also permissible. The board approves the reduction in the number of fare zones on Wrentham branch from two to one, with the abolition of the present transfer privilege between the Mansfield-Foxborough and the Foxborough-Walpole town lines, the company holding the view that the distance is not long enough to justify a two-fare zone at 6 cents. In the board's opinion, the necessity for the other changes in zones and transfer facilities is not demonstrated. The decision is to take effect within thirty days.

Cleveland Builds Four Operating Stations

Attractive Trainmen's Quarters, Commodious Running Repair Shops and Loop Storage Yards Are the Principal Features of These \$225,000 Layouts, of Which the Superior Avenue Station Is Described

In its operating station rehabilitation the Cleveland (Ohio) Railway has adopted loop-yard tracks and outside car storage in preference to inside car storage. The loop-yard tracks are a unique feature and have been found very advantageous from an operating standpoint. The shops for making running repairs at these stations are more extensive than those usually installed at such points, and greater attention than usual has been paid to the architectural appearance of these stations, as most of them are in residential districts. Finally, a great many conveniences for the trainmen were included in these buildings, and their interiors resemble in arrangement and pleasing appearance the rooms of a private club.

REASONS FOR PRINCIPAL FEATURES

Attractiveness, because the buildings were erected in residence districts, and permanency, because that class of construction has been found most economical, were the fundamental features which governed the design. Locations in residential districts or on property certain to develop into them, were selected because they would afford homes for the trainmen near at hand. In addition, dwellings are quite certain to spring up near the end of a line, the best location for a carhouse, and in the end contribute to the patronage of the service. Outside storage was adopted because the management believed that the interest on the unit price of inside storage would more than care for the reduction in paint life and other supposed disadvantages of this method of storing cars. The management also felt that since cars were on the streets practically eighteen hours each day, it was not essential to house them for the six remaining hours, particularly when land for yards could be purchased at a reasonable price. The attractive quarters for the trainmen conform to the policy of this company.

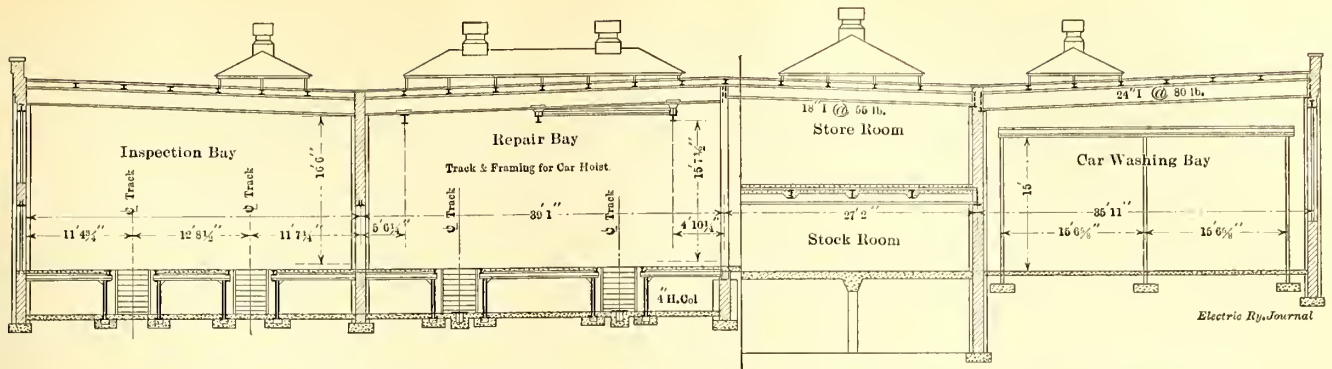

Four operating stations similar in design to the Superior Avenue station will be constructed before rehabili-

tation is complete. The St. Claire Avenue station was completed about two years ago. The Superior Avenue station has just been finished, and similar stations at Harvard Avenue and Fifty-fifth Street, and at Denison Avenue and Seventy-third Street will be constructed in the near future. Each outside loop storage yard is designed to store 193 cars, but sufficient area has been included in each property so that this capacity can be materially increased. In general, the loop storage yards occupy the rear of the property, with the operating station and the running repair shop near the track entrances. The loop storage yard arrangement provides entrance at one side of the yard and exit at the other, and the car movement in the yard is always in one direction. The general layout of the Superior Avenue station is shown in one of the accompanying illustrations.

It is of particular interest to note that expert knowledge of real estate values was employed when the sites for these new operating stations were purchased, as well as when the old ones were sold. While the business of the company is primarily that of railway operation, it has made it a policy to endeavor to collect profits from other sources. This has been particularly true of past real estate purchases for carhouses and shops, which at the present time have greatly enhanced values. The site purchased for the Superior Avenue station included 10 acres in what was originally a gully of little real estate value. At the time of the purchase, however, the company had in mind disposing of the waste track excavation and, in time, filling the gully to the level of the surrounding property. This has been accomplished during the last few years, and, because of the improved condition, the rapidly enhanced real estate values in the surrounding property has netted a handsome return to the company. In fact, it has received offers for small parts of this property which would much more than reimburse it for the original price paid for the entire tract. At the same time the location is central for the

CLEVELAND OPERATING STATIONS—FIRST-FLOOR PLAN OF SUPERIOR AVENUE STATION

track department, consequently an economical point from which to dispose of waste excavated material. The company believes that the cost of improving the property has been more than made up in the savings to the track department.

GENERAL LAYOUT

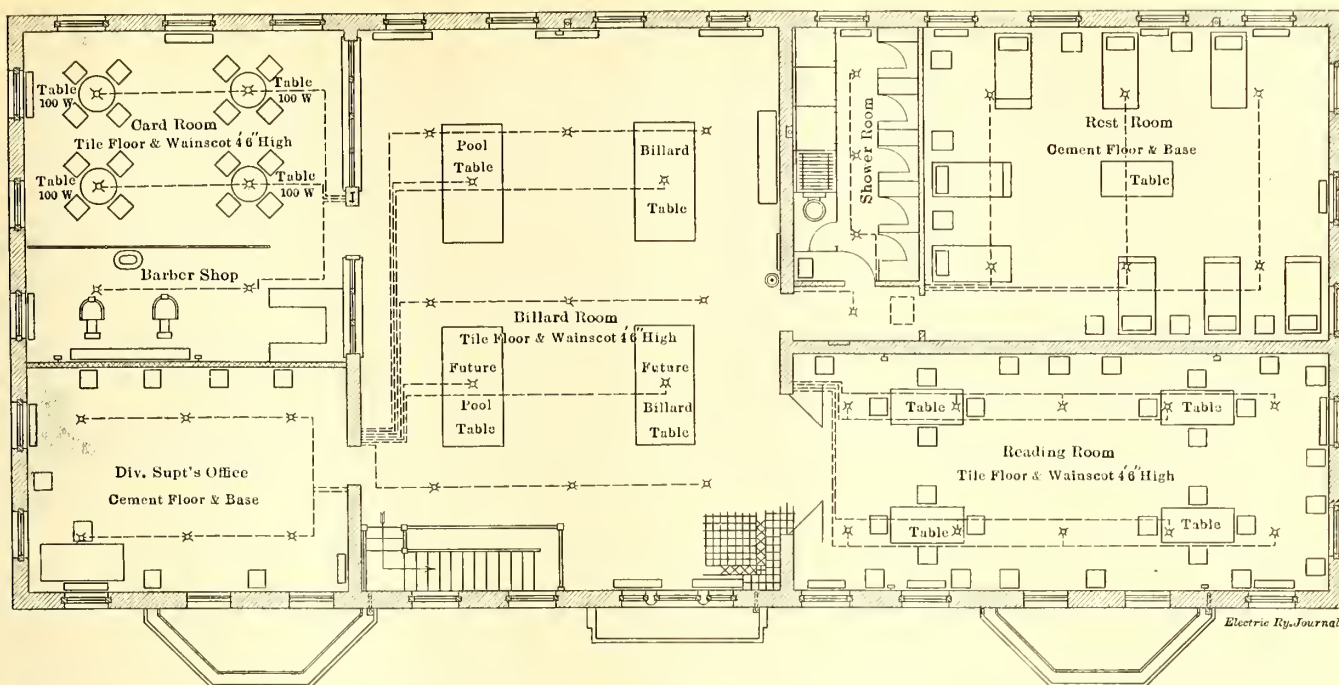

The Superior Avenue operating station occupies a tract of land approximately 300 ft. wide by 1500 ft. deep. Wye-track entrances lead in from Superior Avenue on each side of the property and form ladders for the tracks leading into the running repair-shop bays. From these the entrance tracks connect to the six loop storage tracks which occupy the rear of the property. Cars enter the yard from the corner of Indiana and Superior Avenues and leave by the tracks at the oppo-

site side of the property. A small loop passes around the operating station building at the front of the property and serves to turn the Superior Avenue cars in regular service, this being the end of the line.

The operating station is a two-story structure, 50 ft. x 110 ft. in plan, and the repair shop is a one-story building, 140 ft. 3 in. x 208 ft. in plan, with a partial second floor and basement. The floor plans of both of these buildings are shown in the accompanying illustrations. The station is a thoroughly fireproof, brick, concrete and steel structure in which there is no exposed steel other than the stairway, windows, doors and furniture. The shop building is also a brick, concrete and steel structure, but the beams and columns supporting the roof are exposed. A complete sprinkler system is installed in the shop, however, and this protective feature

CLEVELAND OPERATING STATIONS—GENERAL VIEW OF TRACK ENTRANCES TO SHOPS AND YARD

CLEVELAND OPERATING STATIONS—SECOND-FLOOR PLAN OF SUPERIOR AVENUE STATION

makes this a building upon which the minimum insurance rate was obtained.

Aside from the two large buildings there are a pump house and a concrete water storage well, both used in connection with the monitor fire-protection system in the open storage yard. The pump is electrically operated and automatically controlled, and has a capacity of 1000 gal. per minute at 125-lb. pressure. The grounds surrounding the operating station have been parked, while the track entrances flanking this area have been paved level with the top of rails with limestone screenings. The overhead construction was carefully planned to obtain permanency with the minimum number of poles. Tubular steel poles and span-wire construction were used throughout the layout. The tracks are laid with standard A.S.C.E. 80-lb. rail and man-

ganese center special work. The yard is lighted with 500-watt Mazda lamps suspended at 60-ft. intervals from the span wires. Reinforced-concrete trash bins between and beside the yard tracks were also provided at convenient intervals so that it would be unnecessary to litter the yards when cars were cleaned.

OPERATING STATION DETAILS

Essentially the operating station was planned as a division headquarters and includes dispatcher's, cashier's and division superintendent's offices. The portion of the building occupied by these, however, is small as compared with that devoted to the convenience and welfare of trainmen. The cashier's and dispatcher's offices are in one end of the first floor of this structure, while the remaining portion is divided into a handsomely-

CLEVELAND OPERATING STATIONS—REPAIR-SHOP BAY SHOWING CHARACTER OF CONSTRUCTION

CLEVELAND OPERATING STATIONS—VIEW OF BILLIARD ROOM ON SECOND FLOOR

CLEVELAND OPERATING STATIONS—VIEW OF SCHEDULE ROOM WITH METAL FURNITURE

furnished tile floor lobby, from which entrances lead into large toilet and locker rooms and a trainmen's schedule room. The space on the second floor is devoted to club rooms, with one corner serving as the superintendent's office. On this floor are card room, barber shop, billiard room, rest room, reading room and shower baths. Some of the more important rooms are shown in the accompanying illustrations. They are attractively finished in every detail and furnished with artistic all-metal furniture. The floors and wainscoting are of red square tile laid with black mortar. The lighting scheme is of both the direct and the semi-indirect types. A complete outfit of lockers for both the operating station and the repair shop was furnished by Merritt & Company of Camden, N. J. The metal furniture was purchased from the Art Metal Construction Company of Jamestown, N. Y.

In connection with the operating side of this station it is interesting to note that the cashier, in addition to handling the trainmen's supplies and turn-ins, also acts as a clerk to the dispatcher. The dispatcher, in turn, is the car-mileage accountant who keeps a careful record of the mileage made by each of the cars operating out of his station. This is a very important duty because under its contract with the city the earnings of the Cleveland Railway are based upon the car-miles run. This station operates regularly 101 cars, consisting of fifty-eight motor cars and forty-three trailers.

CLEVELAND OPERATING STATIONS—VIEW IN STATION LOCKER ROOM

In round numbers 200 trainmen work out of this station, and the club-room features are under their control. Certain nominal charges are made, and these are collected by the barber, who also cares for the club rooms. This money is turned over to the dispatcher who, in all cases, is the treasurer of the club and under a \$500 bond. Each club has a president and secretary elected to office, but it was deemed advisable that the dispatcher should be treasurer. A charge of 5 cents a night is made for the use of the cots in the rest room, there being fourteen in all. The barber is paid \$18 a week for his services in caring for the club rooms, showers and beds. He usually runs a small stand where cigars and candies may be had. With this and his barber work, he earns some money in addition to his weekly wage. A charge of 1 cent a cue is made for the use of the billiard tables, and a record of the collections for this is kept on a register. The company furnishes the billiard tables and twenty-four cues, and the employees keep them in repair.

RUNNING REPAIR SHOP

This building is divided into three bays, one serving for inspection purposes, another for running repairs and the third for car washing. Occupying a portion of the repair bay is a stock room where the repair parts are under the supervision of a clerk. A machine shop, an oil room and a boiler room containing the heating plant of the shop building and the operating station also occupy space in this bay. The repair shop of this station was made somewhat larger than those contemplated for the other stations, as it was intended to be a branch of the general repair shop. Light repairs to cars from the other operating stations will be made.

Included in the repair-shop equipment are one No. 2 Bridgeport wet and dry grinder, one 20-in. 8-ft. engine lathe, one 20-in. vertical drilling machine, one power-driven hack saw, one 26-in. power-driven hand saw, a forge and an anvil. Facilities for handling repair parts include a pit jack for motors, three 12-in. air hoists employed in lifting car bodies and removing trucks, two revolving jib cranes, one at each end of the shop, used in general movement of materials, and a motor-driven air compressor installed in the basement to supply air to the pneumatic hand tools and air hoists. A complete oil pump and tank equipment furnished by the Milwaukee Tank Works was installed in the oil room.

Both the repair and inspection bays are built with concrete floors and pits extending the full length of the bay under each track. These pits are constructed

with 7-in. plain girder rails spanning the interval between 4-in. H-column supports. The tracks in the inspection bay are on 17-ft. 2½-in. centers, a spacing which provides liberal aisles along the walls between the tracks.

All tracks in the repair shop are through tracks, entering each bay through openings equipped with double wooden swinging doors. A liberal number of Drouvé skylights equipped with Swartout ventilators furnish a uniform natural illumination. Artificial illumination is supplied by 60-watt tungsten lamps suspended on drop cords. The trolley wire is made continuous through the bays and the usual wooden trolley-trough construction is used. Heat in the repair shop is furnished through pipe coils mounted on racks, while in the operating station there are ornamental cast-iron radiators. Steam is supplied from the central boiler in the repair shop, and the system is of the vacuum type with Dunham vacuum traps for each radiator.

The partial second floor in the repair shop bay over the storeroom is given over to locker and toilet rooms for the shop employees. A portion of the second floor, however, is used for storing the Peter Smith Heater Company's hot-air heaters during the summer months. This storeroom opens into the car washing bay, where a hoist is provided to raise the heaters to the storeroom.

In connection with the washing and cleaning system it is interesting to note that the outsides of all cars are washed every three or four days and the cars are thoroughly washed on the inside every two months. Of course, the usual sweeping and dusting done each night is also a general practice. In connection with the regular method of cleaning, however, two types of vacuum cleaners are being installed for test at this station. Both of these cleaners are of a stationary type, one being furnished by the Spencer Turbine Cleaner Company, Hartford, Conn., and the other by the United Electric Company, Canton, Ohio. If these installations prove satisfactory it is contemplated that the vacuum method of cleaning cars will be extended to include all the stations on the system.

The several departments interested in this operating station installation supervised the design and construction work. Terence Scullin, master mechanic, was in charge of the shop layout; C. H. Clark, engineer maintenance of way, was in charge of track construction; L. P. Crecelius, electrical engineer, was in charge of the electrical layout, all work being under the general direction of J. J. Stanley, president. The building design and construction work, however, were under the supervision of David W. Morrow, of the firm of Morrow & Cross, civil and architectural engineers.

TEXAS HURRICANE—100-FT. BREAK NEAR ISLAND END OF GALVESTON CAUSEWAY APPROACH

Texas Hurricane Damage

The coast of Texas was swept on Aug. 16 by a tropical hurricane, considered the most severe in the history of Gulf storms. A gale which at times reached a velocity of 90 miles, took a heavy toll of lives and wrought property damage which it is impossible accurately to estimate. The storm centered at Galveston, but much damage was reported as far north as the central part of the State. Interurban and city railway service was demoralized along the coast.

About two o'clock on the afternoon of Aug. 16 an interurban car loaded with passengers attempted to leave the island for Houston. The car proceeded nearly to the lift bridge in the center of the causeway over Galveston Bay when a section crumbled and 2000 ft. was swept away by the current. The car rolled to one side, but remained partially in the breach. Most of the passengers escaped without injury. A single-track trestle over Galveston Bay is being discussed by railroad and traction men, as it would not take as long to build the trestle as to repair the causeway.

The city of Houston fared little better than Galveston as to wires and poles. In Waco all street cars were re-routed to avoid passing a seventeen-story building around which the storm seemed to converge.

The Southwestern Traction Company, operating between Belton and Temple, suffered only from trouble caused by wind. The entire damage to all the traction interests, excluding loss of revenues, is unofficially estimated at \$700,000.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Convention Program Includes Addresses by Governor H. W. Johnson, Ex-Senator Jonathan Bourne, Jr., Bion J. Arnold, Jesse W. Lilienthal, Paul Shoup, Prof. H. R. Hatfield, Prof. Carl C. Plehn and Messrs. Winslow and Teesdale, of the U. S. Forest Products Laboratory

PROGRAM FOR THE CONVENTION

The following program has just been announced by Secretary E. B. Burritt. It is still subject to revision.

PROGRAM OF AMERICAN ASSOCIATION

Monday, Oct. 4

9.30 a. m. to 5 p. m.

Registration and distribution of badges at booth, lobby of Native Sons of the Golden West Building.

Tuesday, Oct. 5

9.30 a. m. to 12.30 p. m.

Address of welcome, by Hon. Hiram W. Johnson, Governor of California.

Annual address of the president.

Annual report of the executive committee.

Annual report of the secretary-treasurer.

Appointment of convention committees:

- (a) Resolutions,
- (b) Nominations,
- (c) Recommendations contained in president's address.

Reports of committees:

- (a) Subjects,
- (b) Education,
- (c) Representing association at the American Good Roads Congress,
- (d) Valuation,
- (e) National joint committee on overhead and underground line construction.

Address on "Welfare Work," by Jesse W. Lilienthal, president United Railroads of San Francisco, San Francisco, Cal.

General discussion.

Reports of committees (continued):

- (f) Company membership,
- (g) Company section medal,
- (h) Federal relations,
- (i) Anthony N. Brady medal,
- (j) Compensation for carrying United States mail.

Wednesday, Oct. 6

9.30 a. m. to 12.30 p. m.

Reports of committees:

- (a) Electrolysis,
- (b) Ways and means,
- (c) Company sections and individual membership,
- (d) Dues of company section members,
- (e) Changes in constitution and by-laws,
- (f) Relations with State and sectional associations,
- (g) Public relations.

Address on "Government Ownership," by Ex-United States Senator Jonathan Bourne, Jr.

General discussion.

Reports of committees (continued):

- (h) Operation of motor vehicles,
- (i) Aera advisory,
- (j) Insurance,
- (k) Standards for car loading.

Thursday, Oct. 7

9.30 a. m. to 12.30 p. m.

Reports of committee:

- (a) Cost of passenger transportation service, including report of Bureau of Fare Research.

Address on "The Foundation Principles of the Valuation of Electric Railways," by Bion J. Arnold, chair-

man Board of Supervising Engineers, Chicago Traction, Chicago, Ill.

General discussion.

Reports of committees (continued):

- (b) Taxation matters,
- (c) On recommendations contained in the president's address,
- (d) Resolutions,
- (e) Nominations.

Unfinished business.

Election of officers.

Installation of officers.

Adjournment.

Friday, Oct. 8

3 p. m., Exposition Grounds

Presentation of testimonial from the Panama-Pacific Exposition Company, commemorative of the 1915 meeting, by exposition officials.

(Particulars to be announced.)

PROGRAM OF ACCOUNTANTS' ASSOCIATION

Monday, Oct. 4

9.30 a. m. to 5 p. m.

Registration and distribution of badges at booth, lobby of Native Sons of the Golden West Building.

Monday, Oct. 4

2 p. m. to 4.30 p. m.

Annual address of the president.

Annual report of the executive committee.

Annual report of the secretary-treasurer.

Appointment of convention committees:

- (a) Resolutions,
- (b) Nominations.

Reports of committees:

- (a) Standard classification of accounts,
- (b) Accounting definitions,
- (c) Representing association at convention of railroad commissioners,
- (d) Education,
- (e) Freight and express accounting,
- (f) Passenger accounting,
- (g) Joint report, passenger and freight and express accounting.

4.30 p. m. to 5 p. m.

Joint session with Transportation & Traffic Association
Report of committee:

- (a) Transportation-accounting.

Tuesday, Oct. 5

2 p. m. to 4 p. m.

Address (topic to be announced), by Prof. H. R. Hatfield, University of Chicago.

Paper on "The Merits of Prepayment Cars from the Viewpoint of the Accounting Department," by R. J. Clark, comptroller Metropolitan Street Railway, Kansas City, Mo.

4 p. m. to 5 p. m.

Joint session with Claims Association

Report of committee:

- (a) Claims-accounting.

Wednesday, Oct. 6

2 p. m. to 3 p. m.

Joint session with Engineering Association

Reports of committees:

- (a) Engineering-accounting,
- (b) Life of railway physical property.

3 p. m. to 5 p. m.

Changes in constitution and by-laws.

Address on "Treatment of Charges for Rent of Tracks and Facilities and Rent of Equipment," by Paul Shoup, president Pacific Electric Railway, Los Angeles, Cal.

Address on topic to be announced, by Prof. Carl C. Plehn, University of California.

Reports of convention committees:

- (a) Resolutions,
- (b) Nominations.

Election of officers.

Installation of officers.

Adjournment.

Friday, Oct. 8

See program of American Association.

PROGRAM OF ENGINEERING ASSOCIATION

Monday, Oct. 4

9.30 a. m. to 12.30 p. m.

Registration and distribution of badges at booth, lobby of Native Sons of the Golden West Building.

2 p. m. to 5 p. m.

Annual address of the president.

Annual report of the executive committee.

Annual report of the secretary-treasurer.

Appointment of convention committee:

- (a) Resolutions.

Reports of committees:

- (a) Lightning protection,
- (b) Standards,
- (c) Power distribution,
- (d) Standards (on recommendations contained in above report).

Tuesday, Oct. 5

2 p. m. to 3 p. m., joint session with Transportation & Traffic Association.

Reports of committees:

- (a) Block signals for electric railways,
- (b) Standards (on recommendations contained in above report),
- (c) Joint sub-committee on block signal rules,
- (d) Transportation-engineering.

3 p. m. to 5 p. m.

Reports of committees:

- (a) Equipment,
- (b) Standards (on recommendations contained in above report),
- (c) Buildings and structures,
- (d) Standards (on recommendations contained in above report).

Wednesday, Oct. 6

2 p. m. to 3 p. m., joint session with Accountants' Association.

Reports of committees:

- (a) Engineering-accounting,
- (b) Life of railway physical property.

3 p. m. to 5 p. m.

Reports of committees:

- (a) Constitution and by-laws,
- (b) Power generation,
- (c) Standards (on recommendations contained in above report),

Thursday, Oct. 7

2 p. m. to 5 p. m.

Reports of committees:

- (a) Way matters,
- (b) Standards (on recommendations contained in above report).

Paper on "Some Factors Affecting the Application of

Wood Preservation to Electric Railways," by Messrs. Winslow and Teesdale of the Forest Products Laboratory, United States Department of Agriculture, Madison, Wis.

Reports of committees:

- (c) Heavy electric traction,
- (d) Standards (on recommendations contained in above report),
- (e) Electrolysis.

General Business.

Report of convention committee:

- (a) Resolutions,

Report of committee on nominations.

Election of officers.

Installation of officers.

Adjournment.

Friday, Oct. 8

PROGRAM OF CLAIMS ASSOCIATION

Monday, Oct. 4

9.30 a. m. to 12.30 p. m.

Registration and distribution of badges at booth, lobby of Native Sons of the Golden West Building.

2 p. m. to 5 p. m.

Annual address of the president.

Annual report of the executive committee.

Annual report of the secretary-treasurer.

Appointment of convention committees:

- (a) Resolutions,
- (b) Nominations.

Reports of committees:

- (a) Accident prevention board,
- (b) Employment,
- (c) Ways and means.

Paper on "Automobiles," by S. B. Hare, claim agent Altoona & Logan Valley Electric Railway, Altoona, Pa.

Written discussion.

Tuesday, Oct. 5

2 p. m. to 4 p. m.

Paper on "Standardization of Claims Statistics," by E. E. Slick, claim adjuster Union Traction Company of Indiana, Anderson, Ind.

Written discussion.

4 p. m. to 5 p. m., joint meeting with Accountants' Association.

Report of committee:

- (a) Claims-accounting.

Wednesday, Oct. 6

2 p. m. to 3 p. m., joint session with Transportation & Traffic Association.

Report of committee:

- (a) Claims-transportation.

3 p. m. to 5 p. m.

Changes in constitution and by-laws.

Paper on "A Card Index and What It Means," by J. J. Reynolds, claims attorney Boston Elevated Railway, Boston, Mass.

Written discussion.

Thursday, Oct. 7

2 p. m. to 5 p. m.

Paper on "Safety and Its Relation to Conservation," by B. F. Boynton, claim agent Portland Railway, Light & Power Company, Portland, Ore.

Written discussion.

General business.

Reports of convention committees:

- (a) Resolutions,
- (b) Nominations.

Election of officers.

Installation of officers.
Adjournment.

Friday, Oct. 8

See program of American Association.

PROGRAM OF TRANSPORTATION & TRAFFIC ASSOCIATION Monday, Oct. 4

9.30 a. m. to 12.30 p. m.

Registration and distribution of badges at booth, lobby
of Native Sons of the Golden West Building.

AMERICAN ASSOCIATION LOCAL CONVENTION TRANSPORTATION COMMITTEE

President C. Loomis Allen has appointed the follow-
ing Pacific Coast railway men as a local transportation
committee to co-operate with the corresponding Manu-
facturers' Association committee of which A. G. Jones,
General Electric Company, San Francisco, is chairman;
Henry T. Jones, general superintendent United Rail-
roads of San Francisco, chairman; J. H. Handlon,

claim agent of the same company, and George H. Har-
ris, general superintendent San Francisco-Oakland
Terminal Railways, Oakland, Cal. The names of the
members of the Manufacturers' Association committee
were printed on page 319 of the issue of the ELECTRIC
RAILWAY JOURNAL for Aug. 21.

COMMUNICATION

Dangers of the Jitney

GARFORD MOTOR TRUCK COMPANY

LIMA, OHIO, Aug. 18, 1915.

To the Editors:

So long as the jitney movement is confined largely to
the second-hand motor car or prompted from a deter-
mination to get even with the public service corpora-
tions, there cannot be much assurance of permanence.
The feeling of being imposed upon and a spirit of re-
venge may induce a part of the public to endure hard-
ships, exposure and risks in cheap, poorly-constructed
and wornout equipment, but before long the same peo-
ple will become dissatisfied with such service and will
no longer be willing to be pushed around in crowds
while waiting on sidewalks for the privilege of riding
home in a motor car.

The progress of motor-bus transportation, whether
in the hands of public service corporations or in the
hands of private individuals and known as the jitney,
depends upon the following among other conditions:

1. Regularity and dependability of service.
2. Improvement of street conditions in the average
city to insure the lowest cost of maintenance; other-
wise, the cost will be excessive.
3. Selection of equipment from careful study of re-
quirements in order to insure comfort and safety equal
to that offered by the competitive service.

We hold public service corporations responsible for
the safety of their passengers, and why should not the
individual who attempts public service work be required
to safeguard his patrons? He should be held responsi-
ble, and his responsibility should be beyond any question
of doubt. Every street car is constructed with an al-
lowance of safety beyond any possible occupancy. The
placing of passenger-carrying bodies, with seating ca-
pacities of from ten to fifteen people and standing room
for as many more upon a second-hand pleasure car
chassis or equipment, originally built for a maximum
load of four to seven passengers, and bodies not more
than one-third to one-half the weight of the bus bodies,
endangers life and should not be allowed. These condi-
tions now exist wherever the jitney movement is under
promotion, and in the end must prove disastrous.

We would quickly condemn the public service corpora-
tions were they to offer the public such a conglomer-
ation of unsightly and unsafe equipment as may now be
seen upon the streets of many of our cities. I do not
mean to discourage the movement, but I believe we
should be fair to ourselves in demanding safety and
fairness to those whom we have invited to come into our
communities and invest their money in public cor-
porations and from whom we have always demanded
every comfort and safeguard. The adoption of the air
brake and block signal by the railroads came from the
demand for protection from their patrons and a realiza-
tion by the railroads of the value of such protection to
their patrons. The old wooden coaches, when all went
well, delivered their occupants to their destination but
not with that assurance of safety as with the present-
day steel coaches. Why should not the same considera-
tion be given in the transportation of passengers over
the streets of our cities?

S. M. WILLIAMS, Sales Manager.

Sioux City's Self-Lubricating Trolley Stand

BY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA)
SERVICE COMPANY

Self-lubrication combined with a dustproof, water-tight bearing has been attained in the trolley stand which has been in use on the Sioux City (Iowa) Service Company's cars for the past three years. This end was accomplished by designing the top member of the stand so that it completely incloses the bearing portions of the bottom member. These two members in turn are so constructed and arranged with respect to each other that intercommunicating oil wells and passages are produced which practically maintain all the bearing surfaces in a state of constant lubrication. A plan and a

SIOUX CITY SELF-LUBRICATING TROLLEY STAND

section of this stand are shown in the accompanying illustration. Ninety of these self-lubricating bases are in service on the company's cars and all of them were finished in the company's shops. The cost of each stand complete is approximately \$10.50. Fifty of the stands have been in service for three years and are still in perfect condition, it being necessary, however, to add a little oil each spring to make sure that the lubrication is perfect.

As mentioned before, the stand comprises essentially two parts, a top and a bottom casting. The bottom casting is dished and made with a centrally-located bearing post and a vertical annular wall concentric with the post. The annular wall is integral with the base plate and the bearing post is formed by a pin riveted

at its lower end to the plate. The cap or top casting is also integral in construction and rotates on the base. It is formed with inner and outer annular walls, the inner wall fitting into the space between the annular ring of the bottom casting and the post. Ducts through the inner top casting ring permit oil to flow freely on each side of it.

The cap is fastened to the center of the post by a stud bolt. The lower portion of this bolt screws into the post and the head fits into a recess in the cap casting. A brass washer interposed between the upper end of the post and the under base of the cap forms the bearing seat. By this arrangement the cap casting is supported entirely on the bearing post and rotates freely. The lower edges of the top-casting annular walls are a short distance above the bottom of the well formed by the bottom casting, hence friction between these parts at this point is obviated. The oil chamber between the post and the walls of the top casting is designed to receive a series of anti-friction roller bearings which fix the position of the upper casting on the post. In this way the side and vertical bearings are immersed in oil at all times, and being entirely inclosed are free from dust and water tight.

Reinforcing Metal Poles

BY G. H. M'KELWAY, LINE ENGINEER BROOKLYN RAPID
TRANSIT SYSTEM

In practically all large cities and also in many places where not only good appearance but also permanence is required, the metal pole, either iron or steel, has replaced the wooden pole which was at one time the standard. Although the first cost of the metal pole is much more than that of the wooden one, yet the former lasts so much better than the latter that, except for temporary work or where the wood poles can be obtained very cheaply, the iron or steel is to be preferred.

But the metal pole has been in service long enough to show that it cannot by any means be considered as a permanent fixture and that in time it must be either repaired or replaced. It might be supposed that careful painting would so prolong its life that it could be considered as never having outlived its usefulness, but the truth is that where the protection is most needed is the point where it is most difficult to apply the paint. A careful examination of the tables prepared by the manufacturers of trolley poles will convince a person that the weakest point on the pole, if it be made up of three sections of pipe, which is standard practice, will be at the base of the second section. Yet very few poles fail at that point and when they do they are nearly all new poles. After a pole has been set in the ground long enough to become weakened by rust the almost universal point of failure will be found to be at the ground line or very near to it.

So well have the manufacturers recognized the fact that there is the weakest point that they now make many poles with sleeves of standard or even extra heavy weight either rolled or shrunk on to the lower section at the ground line and so placed that when the pole is set the ends of the sleeve will extend a foot or

more above and below the surface of the ground. By the use of such a sleeve the thickness of the pole at the ground line is perhaps doubled and the life of the pole is increased even more than that, as, of course, it is not necessary that the pole be eaten entirely through before it fails.

Poles that have been set without the sleeves can be reinforced by either installing such sleeves after the rusting has begun or by interior reinforcement. The latter plan can be used even if the pole has been equipped with a sleeve. It could be arranged to install a second sleeve over one that had already been installed but that had been eaten through, although the writer has never heard of such a practice. The principal objection to such a plan would be the steadily increasing diameter of the butt of the pole owing to the added sleeves.

When reinforcing by means of the sleeve is used a choice can be made between the use of a solid or a split sleeve. If the solid sleeve is to be used on a pole already in service all of the arms and wires attached to it must be removed so that the sleeve can be slipped over the top and drop to its place at the butt. Many poles have ornamental rings placed around the joints and also at the ground line and these must be removed before the sleeve can be lowered into position. These rings or collars, although adding slightly to the appearance of the pole, are of no value in protecting the pole against rust, a claim sometimes made for them. On the contrary, they weaken rather than strengthen the pole because they afford a place where water can settle and remain instead of running off at once, as it will do if the joint is properly made and the ends of the pipe are chamfered so as to give no place for the water to lodge.

Either before or after the sleeve has been slipped over the pole, the ground or pavement at the base is broken away and excavated to a sufficient depth to allow the sleeve to be put on at the right height. The sleeve is then supported at the right height and the earth tamped around its bottom to hold it there. After that the sleeve is fastened to the pole by pouring into the annular ring between it and the pole a liquid material which will harden and hold them fast together. The first material to be used between the sleeve and the pole, so far as the writer is aware, was molten lead. This has now been superseded generally by either cement grout or sulphur. The grout is the more common filling material as the use of sulphur is patented, being the base of the patents issued to C. B. Voinow of the Philadelphia Rapid Transit Company. The sulphur, although costing more than the grout, makes a better job as it not only holds the sleeve tighter to the pole and so increases the strength of the pole, but also is an insulator and therefore prevents the leakage of current to the ground at the ground line, although of course leaving a path open for it further down where it will not do so much damage.

Many persons regard the claim that poles are injured through the leakage of current from the trolley wire or feeders through defective or weak insulators as being unfounded, but the writer cannot agree with them. Its truth was forcibly impressed upon him at one time when he was examining the poles on a certain street where all on one side of the street were in good condition but on the other side there were many badly weakened at the ground line. The only explanation that could be given for the difference in condition was that where the poles were bad they were used to support not only the spans and trolley wire but also a feeder wire, so that the deterioration must have been caused by electrolytic action due to the leakage of cur-

rent over the feeder insulators and down the poles to the ground.

When pouring the sulphur into the opening between the pole and the sleeve a piece of leather is held around the sleeve with its top slightly higher than the top of the sleeve. This is for the purpose of having the sulphur at the pole, when it solidifies, a little higher than at the sleeve, a result that is accomplished by wiping off the outer edge of the sulphur before it becomes too hard. The effect of this treatment is similar to that of a chamfered sleeve and causes the water to run off instead of lodging between the sleeve and the pole, which would occur if this plan was not followed and which does occur very often when the sloping portion of the sulphur is broken off after it has been carefully installed. This trouble is not confined to poles where sulphur has been used but is also found where the filling between the sleeve and the pole is of cement, which also should be so sloped off as to permit all water to escape.

The slipping of the sleeve over the top of the pole requires considerable work and makes a rather expensive repair when a number of spans or pull-offs are attached to one pole or when one or more feeder arms are attached to the pole and must be removed and the wires cared for while the sleeve is being put into place. In order to avoid this difficulty split sleeves have been used which need not be slipped over the pole but are merely put together at its base. These sleeves are made of either steel, or cast or malleable iron. Those first made had lugs through which bolts were passed in order to hold the two halves together. Since much trouble was caused by persons catching and tearing their clothes on the projections of either the lugs or the bolts that type is not much used at present. A malleable-iron sleeve of this type but without its objections is made and patented by the St. Louis Malleable Casting Company. Here the two halves have lugs cast upon them, so placed that the two halves dovetail into each other and are held together by means of steel pins passing through holes in the lugs, which are so rounded off as to prevent the possibility of anything catching in them.

Another sleeve very similar to that just described is made by the Drew Electric & Manufacturing Company, which also consists of a malleable-iron sleeve made in halves. The ends of these halves, however, are formed so as to look as if they had been bent over. As one edge bends outward while the other turns inward they engage with each other and the two parts are fastened together by merely slipping one edge into the other. Both of these last-named sleeves are made $\frac{3}{8}$ in. in thickness but the Drew sleeve is further reinforced by ribs that run down it from end to end. Both have inwardly projecting lugs which keep the sleeves a short distance from the pole and allow a space to be filled with cement or some similar material.

There is one more type of reinforcement which not only does away with the necessity of stripping the pole of its cross-arms and other attachments but also avoids the necessity of any digging about the foot of it in order that the sleeve may project below the ground level. In order to avoid these troubles the reinforcement is applied to the interior instead of to the exterior of the pole and consists of a plug of reinforced concrete.

Although poles have been reinforced by dropping into them a piece of tee-rail and filling in around this rail with concrete, this does not insure a good job as the piece of rail is not likely to be well centered, so that the pole is stronger in one direction than in another and there is no way of insuring that the direction in which

the greatest strength can be shown will be the same as that from which the greatest pull will come. Again, there is not the same adhesion between the concrete and the steel in this plan that there is in some of the others in which concrete is used.

A patent has been obtained for the use of a piece of pipe instead of the rail but by whom the writer does not know, and he also has never heard of the plan being widely used.

In the system installed by the New York Pole Company, which is covered by patents, the reinforcement consists of twisted steel rods fastened together at one end by being inserted into a casting and at the other by means of a cap, which, when released permits them to spring out into the shape of an inverted cone. This cone-shaped placing of the rods arranges the steel in the form best suited to the strain coming upon it. The strength of the reinforcement can be altered by changing the size or the number of the rods.

With this method the first thing to be done is to remove the pole cap and then to pour sand down into the pole until it is filled up to a point about 3 ft. below the ground line. The amount of this sand filling to be used is determined by dropping a weighted tape line into the top of the pole and pouring in the filling until the weight rests on the sand at the proper point below the top of the pole. Then the rods, held together at the bottom by the casting and at the top by the cap, are lowered into the pole, and when they reach the bottom the cap is pulled off allowing the tops of the rods to spring out until they touch the inside surface of the pole. Lastly the concrete is poured into the pole until it is filled above the ends of the rods which are generally 5 ft. in length. The pole cap is then replaced and the job is finished.

While this method does not have the protecting quality due to the insulating properties of the sulphur, employed with another plan of reinforcement, yet the reinforced concrete core is generally calculated so as to be equal in strength to a new pole of the size in which it is used as a reinforcement. Therefore, as the reinforcement can be considered as being indestructible, the pole never deteriorates below the strength of a new pole, even if the entire metal shell should rust away at the ground line.

Paint Renovator for Exterior of Cars

BY R. E. HEWITT, MASTER MECHANIC SOUTHERN PACIFIC COMPANY ELECTRIC LINES, WEST ALAMEDA, CAL.

The usual procedure for cleaning paint on cars when they came in for inspection, which is after 1200 to 1500 miles for motor cars and 2000 miles for trailers, was to place them on the wash tables and wash the outside of the car with a diluted mixture of oxalic acid and water, after which the car was thoroughly rinsed off with clear water. Due to the fact that the water used was more or less alkaline, it had a detrimental effect on the life of the paint and varnish. In order to overcome this condition various emulsions and car cleaners were tried without much success. Finally an experiment was made with what is known as Brook's "Car Renovator" and results obtained therewith have been most satisfactory.

This renovator is applied to a car once a month, and between these applications the car is simply rubbed down with clean waste. The renovator has a tendency to feed the varnish and paint, lengthening the life of both, and keeps the paint on the car looking clear, bright and otherwise presentable. This renovator has been adopted as standard for car cleaning by the Southern Pacific Company's electric lines.

Armature Removal

BY R. R. POTTER, SUPERINTENDENT OF EQUIPMENT NEW YORK, WESTCHESTER & BOSTON RAILWAY

The box type of motor frame has many obvious advantages, but its use involves a certain amount of difficulty in making repairs because of the lack of ready access to the armature that was the prominent characteristic of the early split-frame designs. The common method of dismantling the box-type motor requires the installation of a special machine with a heavy bedplate upon which are mounted two arms or centers to support the armature and a movable carriage upon which to rest the motor frame. This arrangement permits the frame to slide longitudinally off the armature after removing the bolts from the bearing housings, and the armature may then be inspected as it rests on the centers or else may be removed and transported to another part of the shop for repairs. However, this method is slow, and the

WESTCHESTER ARMATURE REMOVAL—LIFTING ARMATURE OUT OF FRAME

machine requires some skill in handling and involves a considerable investment as well as a material amount of valuable space upon the shop floor.

Wherever the shop space is limited and when economy has to be carefully considered the use of a special machine for armature removal is obviously undesirable, and as a substitute the method described in the following paragraphs may be used to good advantage. The only equipment required is an overhead crane or other lifting device, which is needed in any case if the armatures are to be handled with reasonable economy. This method, it may be said, has been in use at the shops of the New York, Westchester & Boston Railway for the past three years, during which time it has proved to be thoroughly satisfactory in every respect.

Under the method in question the first step is, of course, to remove the oil and waste packing from the motor bearings. The pinion nut is then unscrewed, and the pinion is heated gently with the circular flame of a gas pipe heater and at the same time wedged away from

and the cars better spaced. The depreciation of trolleys has also been materially reduced.

The diagram shows the relative locations of trolley wire, trolley contactors, aspect cases and relay cases.

Two aspect cases are used, each being equipped with a red lens and a green lens. Normally when the block is unoccupied a green light is displayed in the first aspect case directly opposite the entering contact-maker and a red light is displayed in the second aspect case about 165 ft. ahead. A motorman can enter the block if green is displayed at the first aspect case. Upon passing beneath the contact-maker, if the signal operates properly, the red light in the second aspect case will be extinguished and the green illuminated, giving him permission to proceed, while at the same time the green light will be extinguished on the first aspect case which is now behind the car, and the red will be illuminated, protecting him from a following car. Thus each car passing into the block runs by two green lights and leaves a red light behind it in the first aspect case.

If, however, a car should not properly operate the signal mechanism it would be stopped by the red light in the second aspect case. It will be seen that there is at all times a red light showing in one of the other of the aspect cases and a green light in the other. These two lights are in series and the opposite two lights are in series.

When the car passes out of the block under the contact-maker at the top of the hill the lights return to normal indication. The accompanying halftone shows contact-maker, aspect cases and relay box at the entering end of the block, located near a left-hand curve at the bottom of the steepest portion of the hill. The relay at the leaving end allows a normally alive operating wire which prevents the signal being cleared if the wire becomes crossed with the trolley. Provision is made that a dead ground or 'open' in this wire will prevent the signal being operated to show a proceed indication and will hold cars up by the red light.

A second lamp is provided in each aspect case to come into operation when one burns out, and constant current is provided in the lamp circuit to give uniform illumination with variable voltage. The current regulator is a simple laminated core solenoid device which so regulates the current that the amperage remains constant in the signal lights, regardless of the fluctuation in line voltage. This is ingeniously accomplished by having the core of the solenoid shunt steps on a resistance tube

to increase or reduce the resistance in the line as the voltage rises or falls. The lamps are hooded and show well even with the sun shining against them.

The signal has operated to date without failure, has given protection to approximately 44,000 through car movements, and has relieved an unsatisfactory operating condition. The signal used was purchased from the United States Electric Signal Company and is known as the Type S-2 car-spacing signal.

New 9-In. Grooved Rail for M. C. B. Flanges

The South Philadelphia improvement, now being carried out by the city of Philadelphia and the Pennsylvania and Baltimore & Ohio Railroads, involves, among other things, the laying of several miles of permanent track at grade in Delaware Avenue. In this connection the railroads and the city have worked out a design for a 159-lb. girder rail for general use in the city streets. Cross-sections of the rail and splices and of the approved form of track construction are shown.

Each joint is held with four 1 1/4-in. bolts, passing through 1 7/16-in. holes in the rail web, 1 5/16-in. round holes in the inside splice, and 1 5/16-in. x 1 3/8-in. elliptical holes in the outside splices. The spacing of the four holes is 7 1/2 in., 5 1/2 in. and 7 1/2 in., and the angle plates are 26 in. long. Each plate has two slots and two holes for spikes. The rails are laid on four-hole tie-plates 10 3/4 in. x 7 in. x 3/8 in., with a 3/8-in. shoulder on top and a 1/4-in. shoulder on the bottom. The ties are spaced eighteen to a .33-ft. rail, and for each 33-ft. length the rails are connected with six tie rods, consisting of 2 3/4-in. x 3/8-in. forged bars threaded at the ends and held by a standard square nut each side of each rail web.

The adaptability of this type of rail for tracks laid and operated in a public street used intensively by all

CAR-SPACING SIGNAL—SIGNAL EQUIPMENT AT ENTERING END OF BLOCK

CROSS-SECTIONS OF JOINT AND TRACK, DELAWARE AVENUE, PHILADELPHIA

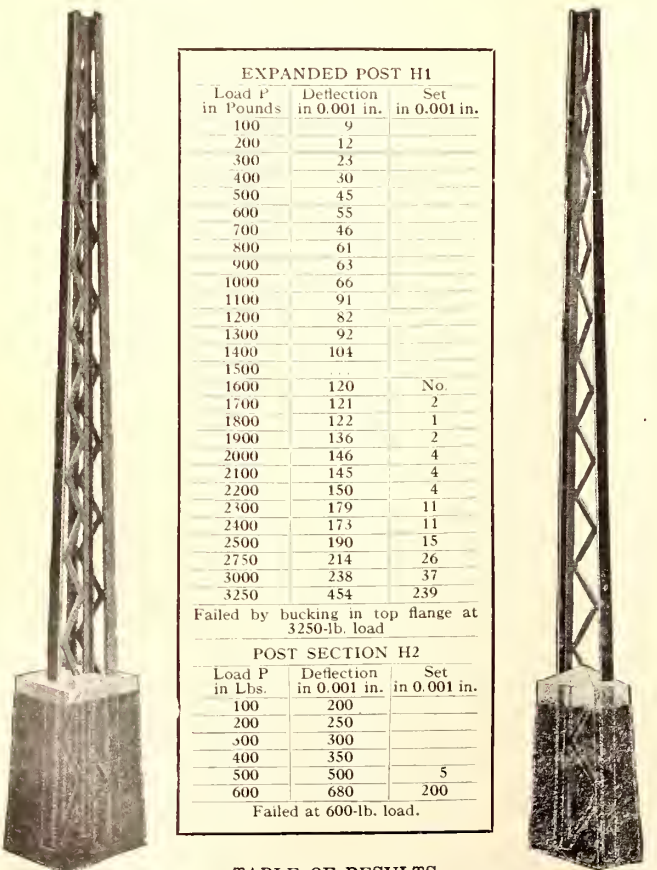

classes of vehicles was carefully considered before a conclusion was reached.

Arrangements have been made with the Pennsylvania Steel Company to supply this new section of rail, which is undoubtedly the heaviest rail of the grooved girder type in this country for which rolls have already been cut.

Steel Pole Strength Per Pound Increased

The demand for a light steel pole weighing about the same as a wooden pole and costing but little more has been supplied by an expanded-metal steel pole which has been put on the market recently. This pole is manufactured from a special rolled H-beam section by an expansion process which increases the strength about 400 per cent without adding to the weight. Accordingly comparatively light sections which, as they come from the rolls are not strong enough to serve as poles in span-wire construction, are sheared, expanded hot and formed into Warren trusses which furnish sufficient strength to meet any average line demand. Although the result is unusual it is logical from an engineering standpoint since it is a well-known fact that a truss structure provides maximum carrying capacity at minimum weight. By utilizing the web for the truss members the expanded-steel pole has no metal which is not performing its proportional share in carrying any load applied to the pole.

An expanded 6-in. H-section in a 30-ft. pole tapers from 6 in. at the top to 17 in. at the base. Careful tests to determine the strength of this pole indicate that it will carry eighty No. 8 wires at 100-ft. spacing or twelve No. 4 wires at 300-ft. spacing. A 30-ft. pole weighs complete without cross-arms or fittings 588 lb., which is slightly in excess of the weight of the 30-ft. wooden pole required for span-wire service. On the other hand, this expanded metal pole costs little more than

CORNER POLE

TABLE OF RESULTS OF TESTS

TROLLEY POLE

EXPANDED AND UNEXPANDED POST SECTIONS, SHOWING POINTS OF APPLICATION OF TEST FORCES (See table)

twice the wooden pole but has much greater strength. Under actual test, a force of 1500 lb. applied 18 in. below the top of a 30-ft. pole set 5½ ft. in the ground, deflects the pole 1 11/16 in. A comparison of the strength of one of these expanded sections with the original section is shown in the accompanying illustrations. This test was made in the Illinois Steel Company's testing laboratory, and the results show quite clearly the increased metal efficiency obtained by the expanded process. Any tendency of the metal to crystallize or fatigue in the expansion process is obviated by preheating the sections to a cherry red just before they are expanded.

The advantages claimed for this pole by the Bates Expanded Steel Truss Company, Chicago, Ill., the manufacturers, include primarily a light-weight steel structure of great strength which may be installed at a cost of material and labor equal to that of wooden poles. Maximum life is obtained by setting these poles in concrete and being a one-piece structure with all exposed surfaces, all parts are readily accessible for painting. The metal is ¼ in. thick, consequently will resist corrosion for a long time. The pole also has all the advantages of a fabricated structure but the elimination of bolts and rivets permits equivalent strength at a greatly reduced weight. Being a light-weight simple structure these poles are as readily and cheaply set as wooden poles and require no special apparatus. Wooden or steel cross-arms may be attached to these poles by L-bolts, the poles being drilled for any number at the time they are manufactured. It is also interesting to note in connection with the manufacture of these poles, that they are dipped while hot into a special preservative bath shortly after they leave the expansion machine. In the heated condition the preservative penetrates the metal which should give it extraordinary life in resisting the elements. The expanded-metal pole is only one of many products which this company is marketing. The others include expanded-metal concrete reinforcement, expanded-metal fence posts, car sills and truck frames.

Cause of Noisy Gears

In an English contemporary it is suggested that noisy gears are caused by small quantities of air which are trapped in the interstices between the teeth that are in mesh and then are hurled out at sufficient frequency to produce an audible musical note, the general action resembling that of the siren. Tests show that the pitch of the note is a simple function of the number of teeth passing a given point per second. For example, a thirty-six-tooth gear making 484 turns per minute (giving 290 teeth passing a given point per second) gives the note that is produced on the standard musical scale by a frequency of 290. Where more than one pair of gears are operating the interferences obscure the musical note and produce an objectionable noise.

News of Electric Railways

PROTECTING LONG ISLAND AUTOMOBILISTS

One Automobile Every Four Seconds at Merrick Road Crossing Presents Safety Problem

The extent of automobile traffic on Long Island, and the urgent necessity for co-operation by motorists in the efforts to prevent accidents at railroad crossings, are strikingly shown by the results of a special count of the traffic taken on Sunday, Aug. 8, by the Long Island Railroad. At the Merrick Road crossing, in Springfield, 9408 automobiles passed between midnight Saturday and midnight Sunday. Of these 4245 were east-bound and 5163 west-bound. At the Barnum Island Road crossing, on the Long Beach branch, 4739 cars passed in the same period, of which 2620 were east-bound and 2119 west-bound. In the single hour from 11 a. m. to noon on Sunday, 845 motor cars passed over the Merrick Road crossing. This is at the rate of more than fourteen cars a minute, or about one every four seconds. The cars counted at these two crossings were, of course, only part of the total number that were operated on Long Island on Aug. 8. Furthermore, nearly all of them must have crossed the company's tracks at other points, not once but several times during a day's run.

The Long Island Railroad is continuing to do all in its power to protect the crossings. Heavy pole gates similar to those recently put in operation on the Long Beach branch have been installed at Central Islip, Suffolk County, protecting the main line tracks through that town. These gates are expected to prove a deterrent to those motorists who, in the past, have been reckless enough to dash their cars through the lighter wooden gates directly before approaching trains. The company has been authorized by the Board of Supervisors of Nassau County to install, at certain points, traffic posts similar to those used by the New York City traffic squad. It is expected that this will be very helpful in the campaign for safety.

STILL ANOTHER COMPANY PUBLICATION

Puget Sound Company Recognizes Value of Proper Propaganda Work

The Puget Sound Traction, Light & Power Company, with head offices in Seattle, Wash., has closed the contest which had for its object the selection of a name for a pamphlet issued by the company in the interests of the company, its employees and its patrons. The pamphlet first made its appearance on the cars of the company July 28, and since that date has appeared regularly each week. To date the leaflet is known as *What's Its Name*.

The contest mentioned closed on Aug. 15, and it was announced that the name selected would be made public on Aug. 25. Three prizes were offered as follows: \$15 for the best name; \$10 for second best and \$5 for third best. In speaking of the contest *What's Its Name* said:

"Some of the suggestions sound good, but we won't give them away until Aug. 25. A number of them are red-hot brickbats, not without a touch of humor. For instance: *The Last Gasp*, *The Wail*, *The Sardine Box*, *The Apologist*, *The Last Stand*."

In addition to propaganda the publication contains information of value to the traveling public, such as city car schedules, interurban schedules, etc. Through it the company is placing before its patrons the side of a corporation in the controversy between the local company and the city of Seattle. In the issue of Aug. 11, *What's Its Name*, on a page entitled "Out in the Open," said:

"Some people have criticised us because we have applied to the Public Service Commission of this State for relief from the continued attacks made on our business by the city of Seattle. 'Brazen audacity of a predatory corporation' is what critics call it. It's nothing of the kind. In taking our case before the State Commission, we told the truth, went into all the details, made a clear and concise statement of our position—and asked for judgment and justice, nothing more."

DISORDER IN WEST PENN STRIKE

The cars of the Allegheny division of the West Penn Traction Company, Pittsburgh, Pa., were tied up on Aug. 19 by a strike of the union operators, who demanded the recognition of their organization. The company issued a statement asking the indulgence of its patrons until it could resume operations. This statement announced that the company was recruiting new men. The company says that its open shop contract runs until 1916 and was signed by all its employees. It is asserted that no favoritism was shown to anyone, whether a member of the union or not, and that all men who desired to do so might belong to the union without prejudice. On Aug. 21 the company re-established service. Disorder followed almost immediately, and on Aug. 22 several cars were stoned and one was set on fire in East Deer Township. On Aug. 24 Patrick Gilday, head of the State Bureau of Mediation and Conciliation, and Francis Feehan, local representative of the department, interviewed representatives of the company and striking employees of the Allegheny division. Mr. Gilday was quoted as stating that there was every hope of a speedy settlement by a submission of the controversy to arbitration.

RHODE ISLAND ARBITRATION

Hearings in the Rhode Island Company arbitration proceedings were continued at Providence with the introduction of evidence by employees in miscellaneous shop departments on behalf of the union. Five weeks of testimony have now been heard by the board. The company's side of the case will probably be begun soon. In the recent proceedings, W. D. Wright, superintendent of maintenance and equipment, said that had there been no union agreement, it would have been probable that the wages of men in the shop would have been increased in the past two years, following a policy of recognizing able workmen. Considerable evidence was presented by the men as to the compensation of various trades in the shops. Among the hourly rates were: welder, 28 cents; wheel grinder, 28.5 cents; tinsmith, 33 cents; radial drill operator, 26.5 cents; wheel stripper, 23 cents; car cleaner, 23 cents; storekeeper, 25.5 cents; assembler, 22 cents; babbitters, 24 cents and 29 cents; valve grinder, 32 cents; boring mill operator, 29 cents; air compressor repairer, 28 cents; blacksmith, 31 cents; car wiring, 20 cents and 26.5 cents; steam fitter, 25.5 cents; armature winder, 22 cents and 23 cents; carpenter, 32 cents. The board has visited the principal shops, power plant and electric freight station of the company. In testifying about power plant conditions, a switchboard operator said that while the capacity of the Manchester Street station at Providence has been increased 50 per cent in the last eight years, the work of a switchboard operator has not increased in severity although the responsibility was greater now.

BIDS RECEIVED FOR RAPID TRANSIT MATERIAL

During the week ended Aug. 21 the Public Service Commission for the First District of New York opened bids on many important rapid transit contracts. Following are the lowest bids received on the contracts, excepting that for the supply of ties and timber, which is not yet available:

Station finish, Routes Nos. 16 and 18, being respectively the Jerome Avenue and White Plains Road elevated lines in The Bronx: Altoria Realty & Construction Company, \$860,636. Supply of felt pads: The Q & C Company, \$9,957. Tie plates: Type "A," Herbert W. Lockwood, \$123,975; type "B," L. D. Rockwell, \$13,267; type "C," L. D. Rockwell, \$5,140; type "D," Herbert W. Lockwood, \$8,239; types "E-2," "W" and "X," Ramapo Iron Works, \$2,901. Cast iron: American Brake Shoe & Foundry Company, \$10,528. Special Work, Order No. 3: Ramapo Iron Works, \$54,950. Special Work, Order No. 4: William Wharton, Jr., & Company, \$41,907. Malleable iron: Foran Foundry & Manufacturing Company, \$36,118. Screw spikes: American Iron & Steel Manufacturing Company, \$25,741.

The contract for ties and timber calls for about 35,000,000 board feet, for use on all lines of the dual system.

EXTENSION OF CIVIC OPERATION RECOMMENDED

R. C. Harris, Works Commissioner of Toronto, Ont., has reported in favor of civic operation of the Mimico and the Scarboro branches of the Toronto & York Radial Railway. Replying to a request from Mayor Church for an expression of his views on the question, Mr. Harris on Aug 10 reported as follows:

"I am of opinion that, having decided to acquire the Mimico and Scarboro branches of the Toronto & York Radial Railway, the city should operate a service over the section acquired, namely, within the city limits. I estimate that the deficit on operation alone, after crediting probable fares, would amount to \$23,200 annually on the Mimico line and \$21,280 annually on the Scarboro line. This is, of course, exclusive of interest, sinking fund and depreciation. When Kingston Road is widened a further expenditure will be entailed for permanent double tracks, located in the center of the roadway. Against these deficits would be credited such amounts as the Ontario Railway Board decides should be paid to the Toronto & York Radial Railway for operating privileges."

Of the Mount Pleasant Road car line Mr. Harris says that if the property for the complete extension is acquired he will, at the next meeting of the committee on works, present bridge plans for the crossing of the Belt Line Railway. It will then be necessary to proceed with the grading of the street and the construction of the railway. Prior to construction being started it will be necessary for the corporation to adopt a policy as to the southerly terminus of the line.

THE STORM AT ST. LOUIS

The storm of Aug. 20 played havoc with the steam and electric lines at St. Louis. Despite the adverse conditions, traffic was restored on the morning of Aug. 21 on nearly all of the divisions of the United Railways with the exception of the Jefferson Barracks, Creve Coeur Lake and Market Street and Manchester lines west of Kings Highway and the Kirkwood-Ferguson line. The University line was placed out of commission early on Aug. 20, as water flooded the tracks and made traffic impossible. About 8 p. m. the line was re-opened. The regular Creve Coeur line suspended operations entirely. Passengers to Vinita Park were carried over the Midland line from Page Avenue and the Suburban tracks. Cars to Jefferson Barracks were unable to cross the bridge at the River des Peres, as the spans were considered dangerous early in the day. While the cars on the Cherokee, Tower Grove, Bellefontaine, Cass Avenue, Seventh Street, Broadway, Grand Avenue, Jefferson Avenue, Sarah Street, Union Avenue, Wellston, Broadway, Park, Compton, Eighteenth, Natural Bridge, Vandeventer and Page lines did not run on schedule, traffic was not suspended on these divisions. Special telephone operators were placed at the switchboards at the general offices of the United Railways at Park and Vandeventer Avenues to furnish information to the public as to traffic conditions. More than 3000 inquiries had been answered up to 9 o'clock p. m. on Aug. 20.

DECISION IN TORONTO EXTENSION CASE

The Ontario Railway & Municipal Board on Aug. 16 confirmed the right of the Toronto & York Radial Railway to construct a line connecting its Yonge Street tracks with a proposed terminal on its Farnham Avenue property. The board's judgment approved the company's application and plans, subject to modifications that may be necessary after hearing the city's objections on engineering grounds. The judgment, which overrules the city's objections on legal grounds to the company's application, was not pleasing to Mayor Church, and the Board of Control may be asked to authorize an appeal against the order. Chairman McIntyre, in giving judgment, stated that there could be no doubt whatever of the need of such a terminal as was proposed, since the returns of the company showed that 5,000,000 passengers and considerable freight were carried annually. The chairman said:

"The right claimed by the company is so trifling an amplification of rights long enjoyed without question, and so obviously necessary to the proper discharge of its functions, that it might well be held to be implied on the ground of powers lawfully exercised by the company for years."

He said further that, apart from implied authority, the express terms of the railway act warranted the conclusion that the company was entitled to connect its tracks with its terminal.

The Board of Control, in conference privately with the city legal department, decided on Aug. 17 to appeal to the Privy Council against the decision of the board in allowing the Toronto & York Radial Railway Company this right. The Board of Control claims that its decision in appealing is not so much a question of the right-of-way across the street being a menace to the public as of a policy on the part of the city. One of the comptrollers said:

"If the company secures that right-of-way, there is a possibility that the Canadian Northern Railway interests might extend their steam railway over the present right-of-way along the west side of Yonge Street to the old terminal."

If such should be the case the city might not be able to prevent the steam road from connecting with the radial lines, because the steam road has a dominion charter. The city previously received a decision from the Privy Council preventing the Toronto & York Radial Railway from crossing the streets south of Farnham Avenue over its own private right-of-way.

WORK OF NEW YORK INDUSTRIAL COMMISSION

A statement of the working of the new State Industrial Commission law in New York was prepared for the *New York Times* by W. C. Archer, second deputy commissioner in direct charge of the settlement of claims, and approved by John Mitchell, chairman of the commission. The statement, published on Aug. 24, follows in part:

"The new Industrial Commission which superseded the State Workmen's Compensation Commission and the Department of Labor on June 1 finds itself after two months in command of the situation but with its hands full of work. It should be appreciated, however, that with functions so vast, powers so various, and duties so numerous, it will take time for the commission to develop the plans in the minds of the lawmakers in framing the law creating the department. The new workmen's compensation law under which employers, in accordance with the schedule of benefits, may make direct agreements with their workmen for compensation, has not been in operation long enough fully to develop a normal experience and thus give a basis for accurate and useful comparison with the former law. It may be said, however, that the number of accidents reported is on a par with experience developed under the first compensation laws.

"Fully 90 per cent of compensatable cases arising under the new law have already developed into claims and agreements and the relative percentage is increasing day by day. The first two months under the new law showed a falling off in cases. This is attributable to the general lack of understanding of the terms of the new law, the time required by insurance companies to reorganize to meet the new situation, and the time required to make and distribute the required forms and to become acquainted with them. But the last two months have seen the very reverse of such condition, and the gain has been so rapid as to bring the aggregate up to 90 per cent, and to indicate an early approach to a fully normal condition as measured by the experience of the last year.

"The bureau has about cleared its books of all cases arising before April 1, namely, under the old law, except those which because of continuing disability must reappear from time to time on the calendar until recovery can guide a final disposition. Death benefits and benefits arising out of the more serious cases, such as amputations, &c., will run on, some of them for years and some of them during the lifetime of beneficiaries. In handling its claims this bureau, in spite of the disadvantage of the vacation period, is up to date with its work and few complaints are heard.

"The State insurance fund enters upon its second year with a substantial increase in the amount of business done and with a splendid demonstration of its ability to retain its first year's business. This is a splendid showing, especially in the face of its being compelled to do business without solicitation and with no other means than through correspondence to explain away the many misrepresentations made by those whose personal interest would desire to embarrass it. Notwithstanding its initial lower rates it has

been able further to reduce its rates and at the same time to give back to its contributing employers substantial refunds through rate reductions."

Mr. Archer said that not only did the direct settlement make possible a saving of upward of \$100,000, but that it enabled the commission to keep within 1,000 cases of the calendar, the minimum possible under the two weeks' injury clause, whereas under the old law, by which the commission heard every claim, the calendar was generally about 6,000 cases behind. Under the new law the commissioners hear only claims where the employer and employee are unable to agree upon a settlement.

Plea Allowed for Fuller Particulars.—Circuit Judge Hunt in the Federal District Court at New York has granted the plea of the indicted directors, officials and counsel of the New York, New Haven & Hartford Railroad for an opportunity to learn more particulars regarding the prosecution for conspiracy begun by the government.

Two Holyoke (Mass.) Arbitrators Selected.—William H. Brooks, attorney for the Holyoke (Mass.) Street Railway, has been chosen by the company as its representative in the forthcoming arbitration proceedings dealing with wages and related conditions of working. Former Mayor John J. White of Holyoke has been named by the union as its representative. The third member of the board is to be appointed by Governor Walsh.

Chicago Elevated Moves Offices.—The general offices of the Elevated Railroads of Chicago, Ill., have been moved from the Royal Insurance Building, where they have been for a number of years, to the new Edison Building, at the corner of Adams and Clark Streets. For the present the general offices will be located on the eleventh, twelfth and thirteenth floors of this building, but eventually the entire twelfth floor will be given over to this company. The Edison Building is also the new home of the Commonwealth Edison Company.

Municipal Belt Line Suggested for Baltimore.—Mayor Preston of Baltimore, Md., has sent a plan to the city planning commission for a municipally owned and electrically operated belt line railroad connecting with the Pennsylvania, Baltimore & Ohio, Western Maryland and Maryland & Pennsylvania Railroads, with provisions for new tunnels through the city and a grand union station at the Fallsway and Bidle Street. The proposed roads and tunnels were outlined and suggested by William H. Maltbie and Daniel B. Banks and would represent an outlay of \$17,369,000.

Detroit Purchase Election Nov. 2.—The Common Council of Detroit, Mich., has set Nov. 2 as the day on which the electors will vote on the proposition of purchasing the lines of the Detroit United Railway within the one-fare zone. At a meeting of the Council on Aug. 23, the plan for the purchase and the charter amendment authorizing it were laid upon the table for thirty days, as provided by statute. Mayor Marx, members of the Street Railway Commission and others addressed the Aldermen in advance of the selection of the date, urging the acceptance of the purchase plan.

Washington Valuation Progress.—On Aug. 23, E. W. Bemis, director of the valuation bureau, and Charles L. Pillsbury, his assistant in immediate charge of the work of valuing the properties of the public service corporations in Washington, D. C., reported to the Public Utilities Commission on the progress of the work. Whether or not the valuation of all the public utilities is entirely completed in November, it will be so nearly finished by that time, according to Mr. Bemis, that the commission will be in possession of sufficient information to enable it to take up rate and other questions that have had to be held in abeyance on account of lack of information.

Cincinnati Transit Commission Law in Effect.—The law creating the Rapid Transit Commission of Cincinnati has gone into effect, and Mayor Spiegel has called the attention of the City Council to the necessity of prompt action in passing an ordinance authorizing the appointment of members of the commission. It is the Mayor's idea that there should be public discussions of the subject to ascertain the will of the people in regard to the proposed bond issue and their choice of routes for a rapid transit railway as marked out by the present unofficial commission. It seems unlikely

that the question of issuing bonds will be placed before the voters at the November election. The Mayor states that he will not make public the names of the commissioners until their appointment has been authorized by the Council.

Must Secure Permits for Highway Rights.—Public utility companies seeking to secure rights-of-way on Pennsylvania State highways must first secure permits from the State Highway Commissioner, according to a ruling made by Highway Commissioner Cunningham, in the South Portage Railway controversy. Tracks laid by the company were ordered removed by William Uhler, chief engineer of highways. The company secured an injunction to restrain the State from interfering with the tracks. Later Commissioner Cunningham informed representatives of the company that they must vacate the injunction and remove the tracks, after which the matter would be taken up.

Commissioners Continued as Constitutional Officers.—In a revised article which was reported on Aug. 19 by the committee on public utilities of the New York State Constitutional Convention, the public service commissioners are continued as constitutional officers, despite the criticism which that provision received in the debate before the article was sent back to the committee for revision. The revised draft provides that the present commissioners shall serve out their terms. Their successors will be removable by the Senate on the recommendation of the Governor, who must file a statement giving the grounds for asking their dismissal. Another feature transferred from the old article would prohibit the Legislature from undertaking any rate legislation, except after the Public Service Commission has been consulted and has submitted a report as to the reasonableness of the measure. A new provision in the revised article would permit the Legislature to change the jurisdiction and number of public service commissioners. The two commissions are continued.

Promoting Publicity in Dallas.—Edward T. Moore, manager of the Dallas (Tex.) Consolidated Street Railway, in announcing the appointment of Bradley B. Hogue as assistant to the manager in charge of publicity said in part: "I am glad to announce the appointment of a Dallas man to this position. We believe the steps the company takes to develop further and to improve more fully a Dallas service for Dallas people constitute news items that are a gratification to Dallasites and a valuable advertisement of the progressiveness of Dallas to outsiders. While our desire to give out news items of interest is strong, our nose for news is often weak. We have, therefore, decided on creating this position and filling it with a former newspaper man, who knows a 'story' when he sees one. A part of Mr. Hogue's duties will be to act as sort of first aid to the reporter in search of a story here. I know of nobody who shows more genuine enthusiasm over the job than a reporter after news and when I can help satisfy that enthusiasm I am glad to do it." The appointment of Mr. Hogue was noted in this paper for Aug. 21.

Signing of Construction Contract Ordered.—Supreme Court Justice Shearn in a decision handed down on Aug. 23 granted a peremptory writ of mandamus directing the Board of Estimate and Apportionment of New York City to "reconvene forthwith" and sign the contract with the Holbrook, Cabot & Rollins Corporation for the construction of the Times Square section of the Broadway-Seventh Avenue subway. The mandamus writ carries with it, too, an order that the Board of Estimate prescribe the amount of corporate stock needed to meet the city's obligation in carrying out the contract, and directs the Comptroller to issue the stock "without any condition or proviso whatever." The Public Service Commission is also directed to do its part. The Justice takes into consideration the act of the Board of Estimate in amending the contract with regard to extra work after bids had been opened and the Holbrook, Cabot & Rollins Corporation had been discovered to be the lowest bidder. This action of the Estimate Board was taken on the recommendation of Tilden Adamson, Director of the Bureau of Contract Supervision, after the Public Service Commission had accepted the contract form without alteration and sent it to the Estimate Board for approval. Justice Shearn finds that the Estimate Board had no power to so alter the contract. The principles involved in the case were referred to in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, page 328.

Financial and Corporate

ANNUAL REPORTS

Seattle Municipal Street Railway

The City Utilities Department, which has charge of the operation of the Seattle (Wash.) Municipal Street Railway, has issued the following income, profit and loss statement of the company for the year ended May 31, 1915:

Revenues:	Division		Total
	A	C	
Passenger	\$14,854	\$15,749	\$30,604
Freight		1,802	1,802
Miscellaneous	2,938	103	3,041
Total	\$17,792	\$17,654	\$35,447
Operating expenses:			
Way and structures.....	\$ 659	\$2,225	\$2,884
Equipment	1,285	709	1,994
Power	6,056	4,944	11,000
Conducting transportation:			
Passenger conductors and motormen..	10,732	8,764	19,496
Freight conductors and motormen..		788	788
Car house employees.....	3,412	1,201	4,613
Other transportation employees.....	578	1,036	1,614
Other transportation expenses.....	584	277	861
General and miscellaneous.....	79	3,039	3,118
Total	\$23,385	\$22,983	\$46,368
Loss on operation.....	\$5,593	\$5,329	\$10,921
Interest on bonds.....			13,500
Grand total			\$24,421

The Seattle Municipal Street Railway has two lines owned and operated by the city—Division "A" within the city limits, approximately $4\frac{1}{2}$ miles in length, consisting of $3\frac{1}{2}$ miles of double and $\frac{3}{4}$ mile of single track, beginning at Third Avenue and Pine Street and running in a northerly direction to Thirteenth Avenue West and Nickerson Street. The other line, Division "C," was a gift to the city by real estate speculators who, finding the property a heavy financial burden, offered it to the city as a gift. The road cost \$125,000, is approximately $8\frac{1}{2}$ miles long, with $4\frac{1}{2}$ miles within the city limits and 4 miles outside, runs in a southerly direction beginning at Spokane Avenue and Iowa Street, and ends at Seahurst. The lines are widely separated—about 3 miles apart, and in opposite parts of the city—one in the south and the other in the north end.

The miscellaneous receipts of Division "A" in the above table represent simply accrued book accounts for the rental of cars by Division "A" to Division "C," no cash being involved. During the year Division "A" carried 339,611 pay passengers and Division "C" 305,495, or a total of 645,106. The passenger car miles totaled 168,452 for Division "A" and 143,942 for Division "C," while the freight car miles numbered 4 328 on Division "C." The earnings per car mile were \$0.1056 on Division "A" for passenger service and \$0.1101 on Division "C" for passenger service and \$0.4161 for freight service, while the operating expenses per car mile were \$0.1388 on Division "A" for passenger service and \$0.1541 on Division "C" for passenger service and \$0.1820 for freight service.

The loss of \$24,421 for the year is exclusive of interest on borrowed funds, depreciation, taxes, damages, overhead charges of any kind, as well as accounting, superintendence and legal expenses. As showing what a small part of the loss suffered by the community through the operation of the railways is included in this figure, it has been estimated that exclusive of charges for superintendence, accounting, legal insurance or damage expenses, the charges for taxes, depreciation and interest on borrowed funds alone would amount as follows:

Interest at $4\frac{1}{2}$ per cent on \$90,000 borrowed from garbage fund	\$4,050
Interest at $4\frac{1}{2}$ per cent on \$9,000 borrowed from general fund for operation.....	405
Interest at $4\frac{1}{2}$ per cent on \$27,500 borrowed from general fund to rehabilitate Division "C".....	1,224
Interest at $4\frac{1}{2}$ per cent on \$10,000 borrowed from general fund for operation (three months).....	113
Depreciation at 4 per cent on \$403,000 plant cost Division "A".....	16,120
Depreciation at 4 per cent on \$156,000 plant cost Division "C".....	6,240
Lost taxes, Division "A," on 45 per cent valuation.....	7,435
Lost taxes, Division "C," on 45 per cent valuation.....	2,878
Loss 2 per cent on gross passenger receipts.....	612
Total	\$39,077

Alabama Traction, Light & Power Company, Ltd.

The statement of income, profit and loss of the Alabama Traction, Light & Power Company, Ltd., New York, N. Y., for the year ended Dec. 31, 1914, is as follows after eliminating inter-company items:

Operating revenues:	
Light and power department.....	\$513,234
Railway department	94,463
Gas department	45,358
Water department	4,539
Total	\$657,594
Deduct:	
Rebates and discounts.....	\$35,137
Reserve for bad debts.....	2,679
Total	\$37,816
Net operating revenue.....	\$619,778
Operating expenses:	
Light and power department.....	\$217,577
Railway department	71,841
Gas department	27,665
Water department	5,209
General expense	1,000
Total	\$323,292
Net operating income.....	\$296,486
Add interest on deposits.....	3,070
Gross income before deducting bond interest and depreciation	\$299,556

The war in Europe has resulted in a general business depression far more severe than any which had previously existed. As a direct consequence it has been impossible to secure new power business on the scale anticipated, and at the close of the year the company's revenue was very considerably short of the amount necessary to cover fixed charges and operating expenses.

At the outbreak of the war tentative arrangements which had been made in London for the further financial requirements of the company could not be consummated. In London on Oct. 21, 1914, about 75 per cent of the bondholders agreed to defer for three years the bond interest due on Sept. 1, 1914, and March 1, 1915; to cancel the obligations contained in the trust deed to provide a sinking fund for the repayment of the bonds, and to authorize any of the subsidiary companies to issue bonds or debentures in the nature of prior lien securities under certain restrictions.

The directors deemed it advisable to arrange for an issue of bonds of the Alabama Power Company, the principal operating company, and in connection with such issue to merge all the subsidiary companies into the Alabama Power Company. This merger was effected and arrangements were closed early in March, 1915, for the sale of \$2,000,000 of three-year 6 per cent gold bonds to Harris, Forbes & Company, New York. The sale of the new securities enabled the company to liquidate all its obligations and to proceed vigorously with extensions.

ENGLISH LINES SHOW VARIED RESULTS

The London County Councils Tramway, London, England, had a deficit for the year ended March 31, 1915, after all charges, of £33,172. Passengers carried numbered 550,497,993 as compared with 522,952,640 in the preceding year. The total income for the year was £2,399,847 and operating expenses, including the war allowance to employees on active service, were £1,700,571, leaving net of £699,276. Car-miles operated during the year were 58,978,792 and the cost per car-mile of the electric railways, excluding war allowances, was 13 cents. Including war allowances, this cost was 13.6 cents a car-mile. The receipts on the electric lines were 19.4 cents a car-mile, as compared with 18 cents a car-mile for the preceding year. Up to March 31, 1915, capital expenditures on the lines had been £13,315,723, of which £287,604 was expended in the fiscal year.

The committee in charge of the tramways is taking steps to improve the financial position of the undertaking and attaches great importance to the consolidation and the linking up of the lines, a matter which has been held in abeyance for the present. The committee states that the conditions under which the undertaking has been worked since the outbreak of the war have been abnormal, producing results not fairly comparable with results under

normal conditions. During the first four months of the financial year the tramways were worked under normal conditions, the results being satisfactory. The receipts from April 1 to Aug. 5, 1914, were about 5½ per cent more than the receipts for the corresponding period of 1913.

The effect of the war on the Manchester (England) Corporation Tramways was to reduce the revenue for the last year by £23,434. The total for the year ended March 31 was £901,875, as compared to £925,309 in the previous year. This decrease was caused by the great falling off in the traffic receipts since the outbreak of the war. If normal conditions had prevailed throughout the year the traffic receipts, instead of showing a decrease, would, according to the annual report issued, have shown a considerable increase. The receipts for the first four months clearly indicated this, and there is no doubt that but for the war the estimate of the revenue (£950,600) made at the beginning of the financial year would have been realized. The effect of the war, therefore, has been to cause a drop in revenue of nearly £50,000.

Considerable savings were made in the operating expenses as compared with last year, but the total expenditure was largely increased by the war service allowances (£31,763), representing mainly the payments made to the 1554 men who had joined the colors up to the close of the financial year. The net result shows that after paying the £100,000 in relief of the rates it was possible to pay only £48,584 to the reserve renewals and depreciation account, as compared to £97,219 paid to this account last year.

The total revenue of the Leeds Municipal Tramways for the year ended March 31 was £422,353, an increase of £6,312 over that for the previous year. Operating expenses being deducted left a net revenue of £200,310, as against £195,730 in the previous year. The working expenses are approximately 53 per cent of the total revenue. After deducting the interest paid on capital, income tax, rent on lines and war allowances to dependents of those employees on active service, there was left a balance to be carried to the appropriation account of £147,479, which compares with £151,735 in the preceding year.

The amount to be set aside for depreciation was £56,230; and with further deducting the cost of upkeep of permanent way and electrical renewals, there was left a net surplus of £79,389, available for the relief of the rates. This is the largest amount ever applied from this undertaking to the relief of the Leeds rates. Prior to the outbreak of the war it was estimated that the relief would amount to £92,463, but the first ten weeks after the war began showed a reduction in revenue of £6,800, while war payments to employees' dependents represent an annual sum of £4,340.

WEST VIRGINIA MERGER RUMORED.

The visit of a party of West Virginia traction officials and Eastern bankers to various traction systems of the state has led to the rumor that a gigantic traction merger is planned to give a continuous trolley system through the interior of the state, reaching almost from border to border. The rumored merger would mean the amalgamation of the Monongahela Valley Traction Company, the Weston-Glenville Traction Company, the Kanawha Traction & Electric Company and possibly the Parkersburg and Charleston systems and the construction of connecting links.

The bankers and traction officials are traveling in automobiles from the southern terminal of the Monongahela Valley Traction Company's system at Weston by way of Glenville and Burnsville to Parkersburg and Charleston. Among those in the party are George T. Watson, Fairmont, vice president Consolidation Coal Company; James O. Watson, Fairmont, general manager Monongahela Valley Traction Company; S. D. Camden, Parkersburg, president Parkersburg, Marietta & Interurban Railway; T. Edward Hamilton, president Hamilton Banking Company, Baltimore, Md., and R. C. Hoffman, of the Pennsylvania Steel Company, Philadelphia, Pa.

American Public Utilities Company, Grand Rapids, Mich.—At the annual meeting of American Public Utilities Company Walter H. Lippincott was elected a director to succeed Henry S. Morris, Philadelphia.

Buffalo (N. Y.) Southern Railway.—At a recent meeting of stockholders William A. Bundy and Charles B. Pheller, Buffalo; David K. Harrington, Orchard Park, and John J. Roberts, New York, were elected directors of the Buffalo Southern Railway.

Brantford (Ont.) Municipal Railway.—The Brantford Municipal Railway after six months of operation has earned sufficient to cover the operating expenses and leave a balance of \$8,284. After payment of local taxes and fixed charges, however, there is a net deficit of \$3,438. The commission hopes that the system will pick up within a year, when Mohawk Park is improved and a loop line in Eagle Place taps the factories of the city, which have hitherto not been reached.

Everett Railway, Light & Water Company, Everett, Wash.—An election was to be held on Aug. 24 on the question of issuing \$1,100,000 of 6 per cent bonds, the proceeds of which it is proposed to use for financing the purchase or the condemnation and purchase of the plant belonging to the Everett Water Company, which is owned by the Everett Railway, Light & Water Company.

Fort Wayne & Springfield Traction Company, Decatur, Ind.—At a receiver's sale on Aug. 12 the Fort Wayne & Springfield Traction Company was bid in by Martin Gerke for Mrs. Rosetta Dirksen and Mrs. Emma Gere, who represent an organization of the old stockholders. It is reported that these stockholders have organized the Fort Wayne, Decatur & Southern Traction Company to operate the line. The sale price was \$78,000, a deposit of \$5,000 having been required of all bidders. The buyers have sixty days to pay the balance. It was the fifth time the road had been offered for sale and the second time it was sold. Last May the same persons bid in the road for \$84,000, but failed to make the required payments, forfeiting a deposit of \$1,000. The sale is expected to be confirmed at once by the Circuit Court. Previous references to this company were made in the *ELECTRIC RAILWAY JOURNAL* of May 13 and 22, June 19 and July 31.

Los Angeles & San Diego Beach Railway, San Diego, Cal.—The Los Angeles & San Diego Beach Railway has filed with the California Railroad Commission an application for authority to issue a \$15,000 note for four months at 6 per cent to the American National Bank, San Diego, to renew a similar note. The proceeds were spent for betterments to the railway.

Philadelphia Company, Pittsburgh, Pa.—The Duquesne Light Company, which is controlled by the Philadelphia Company, recently issued \$1,000,000 of additional 7 per cent cumulative preferred stock. The company now has \$1,700,000 of such stock outstanding.

San Francisco (Cal.) Municipal Railways.—The gross receipts of the San Francisco Municipal Railways for July were \$221,337. This averages \$7,140 per day and is the heaviest gross return in any one month since the system has been operating.

San Francisco-Oakland Terminal Railways, Oakland, Cal.—The suit brought by the Anglo-California Trust Company, San Francisco, against the United Properties Company and other stockholders of the Oakland Railways, as noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, for recovery on the issue of \$2,500,000 of Oakland Railways notes of Aug. 12, 1912, is said to have been made to protect the noteholders in the event that the pending reorganization of the San Francisco-Oakland Terminal Railways, which controls the Oakland Railways and is in turn controlled by the United Properties Company, is not carried out. It is said that the statute of limitations would have made the trust company unable to sue after Aug. 15. The California Railroad Commission has issued a supplemental opinion in the application of the San Francisco-Oakland Terminal Railways for authority to pledge with the Commonwealth Bonding & Casualty Insurance Company \$18,000 face value of its general lien mortgage bonds and \$40,000 face value of the same bonds as security for surety bonds in connection with damage suits.

Seattle, Renton & Southern Railway, Seattle, Wash.—The Supreme Court, in modifying an order entered some months ago by Judge A. W. Frater in the Superior Court, states that Peabody-Houghteling & Company, who are

interested in the Seattle, Renton & Southern Railway, are entitled to interest as well as the full amount of the loans made to the local company. The claim was that of a general creditor and rested upon notes given from time to time in exchange for loans. The lower court declined to allow interest, as noted in the *ELECTRIC RAILWAY JOURNAL* of Feb. 13, 1915, but the Supreme Court has ruled that it must also be paid. The court has also affirmed the decision of Judge Frater making preferred the claim of Augustus H. Peabody, trustee for the holders of \$1,000,000 bonds of the railway.

Southern Traction Company of Illinois, East St. Louis, Ill.—A suit to determine the various interests of claimants against the property of the Southern Traction Company of Illinois has been filed in the United States Court at Danville. The action is brought by the Union Trust Company & Savings Bank, St. Louis, Mo., trustee for the original bondholders. The line was partially constructed for 15 miles near St. Louis, by former United States Senator William Lorimer.

Syracuse & South Bay Electric Railroad, Syracuse, N. Y.—On account of unexpected and unavoidable delays of a routine nature, it is said that the foreclosure sales of the Syracuse & South Bay Electric Railroad and the Syracuse, Watertown & St. Lawrence River Railroad will not be possible until the latter part of October or early in November. Previous references to these companies were made in the issues of the *ELECTRIC RAILWAY JOURNAL* of May 29 and June 19.

Toronto (Ont.) Railway.—Seventy-nine 4½ per cent currency bonds, par \$1,000, and 305 sterling bonds, par £100, issued under the first mortgage dated Sept. 1, 1892, have been drawn for redemption at par and interest on Aug. 31 by the Toronto Railway.

Union Traction Company, Santa Cruz, Cal.—A meeting of bondholders of the Union Traction Company was scheduled for Aug. 25 to investigate the condition of the corporation through the appointment of a committee of bondholders. Owing to the prevalence of the auto habit, the gross earnings of the company fell off from \$82,000 during the year ended June 30, 1914, to \$69,377 in the last fiscal year. The deficit for the year just ended was \$11,116. An amount of \$23,636 was on June 30 due to the Coast Counties Gas & Electric Company, which owns the Union Traction Company stock but has not guaranteed any of its obligations.

United Railroads of San Francisco, San Francisco, Cal.—The California Railroad Commission has extended the effective date of its order of May 17, requiring the United Railroads of San Francisco to set aside \$550,000 a year for three years for betterments, until such time as the commission has denied or granted the petition for a rehearing that has been filed by the company. The company protested that it was impossible for it to comply with the order.

Westinghouse Electric & Manufacturing Company, Pittsburgh, Pa.—Up to the close of business on Aug. 17 stockholders had subscribed for \$18,237,000 of new convertible bonds from the \$18,695,000 offered for subscription at 105. Under the terms of the agreement the unsubscribed bonds, \$485,000, will go to the holders of the old bonds. Of the total subscriptions payment was made in full for \$16,423,000 of bonds. On the balance the first installment was paid. The conversion plan, which was declared operative by Kuhn, Loeb & Company in July, was described in the *ELECTRIC RAILWAY JOURNAL* of May 8.

Winnipeg (Man.) Electric Railway.—The Winnipeg Electric Railway has applied to the London Stock Exchange for the listing of £400,000 of 4½ per cent perpetual consolidated debenture stock. This makes a total listed of £900,000.

Youngstown & Ohio River Railroad, Leetonia, Ohio.—The gross earnings of the Youngstown & Ohio River Railroad during the year ended June 30, 1915, totaled \$290,164, as compared to \$273,603 for the preceding year. The operating expenses, taxes and rentals increased from \$175,678 in 1914 to \$185,674 in 1915, giving net earnings of \$97,925 in 1914 and \$104,490 in 1915. The bond interest each year amounted to \$50,000, so that the surplus for the last fiscal year was \$54,490 as compared to \$47,925 in 1914.

DIVIDENDS DECLARED

Louisville (Ky.) Traction Company, 2½ per cent, preferred; quarterly, 1 per cent, common.

Northern Ohio Traction & Light Company, Akron, Ohio, quarterly, 1¼ per cent, common.

Wisconsin-Minnesota Light & Power Company, Eau Claire, Wis., quarterly, 1¼ per cent, preferred.

JITNEY JOTTINGS

Public Service Commission and Court Action in New York on Jitney

The Public Service Commission for the Second District of New York, in addition to the court action taken recently to restrain the operation of jitney-bus lines in Rochester and Corning which have not secured certificates of public convenience and necessity, has instituted upon the complaint of the New York State Railways and the Corning & Painted Post Street Railway action against three jitney operators in Corning and seven in Rochester. These proceedings will be before the commission itself. The complainants allege that the jitney men are operating in violation of the law passed at the last session of the Legislature by carrying passengers within a city of the State for 5 cents and in competition with a common carrier, and invoke the power of the commission to stop them. The complaints have been served on the various jitney men, and upon receipt of their answers dates for hearings will be set by the commission.

Both the street railways allege that their business is being injured by the operation of these vehicles contrary to law, and claim the same protection from the Public Service Commission as might be afforded to an individual. The hearings before the commission will amount to a trial of the issue as to whether or not the jitneys are violating the law. Should it be proved that they are, the commission is empowered to take legal steps to prevent their operation.

In addition to the cases mentioned, the commission also has in the correspondence stage a number of similar matters from cities all over the State, in some instances originating with citizens and in others with street railways. As yet there has been but one formal application to the commission for a certificate of public convenience and necessity for the operation of a jitney line. This came from the Troy Auto Car Company, but was withdrawn in order that the proprietors of the line might make some changes in their incorporation. As rapidly as formal complaints are made the commission, according to its established procedure in all cases, serves the complaint on the alleged offender, and after giving him an opportunity to answer tries the issues which may thus be joined. The complaints served on Aug. 20 in the Rochester and Corning cases are the first which have been made formal.

The motor-bus service between Lockport, N. Y., and Olcott Beach on Lake Ontario, a distance of 12 miles, for which a fare of 50 cents was charged, was dealt a death blow by Justice Brown in the Special Term of the Supreme Court in Buffalo, N. Y., in an opinion handed down, in which the justice held that the owners of the line must get a certificate of necessity and convenience from the New York State Public Service Commission, Second District, and a permit from the City Council of Lockport. The court granted an injunction restraining Mr. Hurtgan from operating his motor vehicles and carrying passengers for hire in Lockport. Burt G. Hurtgan, Newfane, owned the line. Arguing before the court, counsel for the defendant claimed that he did not collect fares between points in Lockport nor did he discharge passengers anywhere within the city limits, but merely operated a bus line between two points in the State over a state highway, not in violation of any law and not under the jurisdiction of any commission or law-governing body. Representatives of the International Railway, who filed the complaint against the jitney service, held the line was in competition with the railway and ran parallel to its right-of-way for miles. The court held the service was under the jurisdiction of the Thompson law passed last winter.

The jitney situation in Philadelphia has undergone such rapid changes during the week that overnight developments have cut the number of cars operating on Broad Street from 1200 to eight. This was the result of the police department enforcing the ordinance regulating jitneys. Drivers who had threatened to run the police gauntlet and risk arrest underwent a change of heart. Three unbonded drivers who operated were arrested. One of them was released because

he told Magistrate Beaton in City Hall that he operated from a fixed stand and charged more than 5 cents for a ride. The other two were discharged when they explained that they operated large machines and came under the provisions of the omnibus bill of 1907 by carrying thirty or more passengers.

That all the Philadelphia jitney ordinance is in force excepting that part of one section requiring the jitneys to travel over the whole of prescribed routes for a fare of 5 cents; that to make "sight-seeing" cars out of jitneys would be evading the law, and that the \$2,500 bond required for each car operating as a jitney was prepared in accordance with the ordinance were declared to be the facts in an opinion given by City Solicitor Ryan to Director of Public Safety Porter. In his opinion Mr. Ryan said: "In connection with the general jitney question, I would suggest that neither you nor I have any power to alter or amend the terms and provisions of the ordinance in relation to the duties devolved upon us respectively by it, without regard to our private opinions on the subject."

The first section of the ordinance specifically exempts "any street railway car or motor-propelled vehicle used exclusively for sightseeing purposes." Mr. Ryan held that under this exemption any vehicle which is in good faith used genuinely for what are known as sightseeing purposes at the time of the passage of the ordinance should be permitted to run without reference to the requirements which the ordinance contains.

In Gloucester City, N. J., an ordinance regulating jitneys has been passed by Councils, fixing the license fee at \$20 for each car having a seating capacity of four, \$25 for a car having a capacity of five, \$30 for those of six, and increasing by \$5 per person up to \$50 for machines carrying ten persons. The license fee applies to both residents and non-residents.

I. M. Howell, Secretary of State of Washington, reports that since the jitney bus-bonding law, passed by the 1915 Legislature, went into effect on April 1 911 jitney buses have been bonded in first-class cities of the State. Of this number eighty-three have been cancelled or surrendered, leaving 828 jitney buses operating on Aug. 15. The cities affected by the jitney bus law are Seattle, Tacoma, Spokane, Bellingham and Everett. The law provides for a bond of \$2,500 for each jitney operating in a first-class city. The figures of Mr. Howell show that most of the withdrawals have come from Spokane, due no doubt to stringent municipal regulation, as compared with the ordinances regulating buses in Seattle and Tacoma. In Spokane eighty-eight jitneys have been bonded, but of this number twenty-two have surrendered their permits. In Seattle 628 permits have been issued. Of this number forty-five have been surrendered, leaving a total of 583 still operating. Surrender of the bonds and permit has been made either at the request of the bonding company or the jitney-bus operator himself. In the former instance the bondsman has asked to be relieved of the risk, while in the latter the operator has found a more lucrative field of endeavor in another city or has retired from the business. The complete figures are as follows: Seattle, permits, 628; cancelled, 45; net, 583. Tacoma, permits, 144; cancelled, 13; net, 131. Spokane, permits 88; cancelled, 22; net, 66. Everett, permits, 39; cancelled, 3; net, 36. Bellingham, permits, 12; cancelled, none; net, 12.

The Common Council of Lansing, Mich., has passed a regulatory ordinance governing jitney buses by which they must pay a license fee of \$26 annually and provide a bond of \$10,000 as a protection for passengers. The jitney bus men threaten court action to prevent enforcement of the ordinance. Considerable feeling exists against the jitney men because after the cars stop running at night they boost their fare to 10 cents.

The city of Los Angeles, Cal., on Aug. 5 paid to the secretary of the Auto-Bus Owners' & Operators' Association \$4,000 as refund on excess jitney bus license fees received by the city. Other similar claims are pending.

The city ordinance of Austin, Tex., regulating the jitneys was held void and of no effect by District Judge A. S. Fisher in the N. C. Partin habeas corpus proceedings that grew out of opposition on the part of the jitney men to the ordinance. The court holds the attempt of the city to define certain cars

as jitneys to be in violation of constitutional rights. It holds that the city has the power to license automobiles, but not to discriminate between service automobiles. Calling certain cars jitneys gives the city no right to impose a heavy tax upon them. The right of the city to control the street is upheld. Referring to the I. W. Sullivan case, in which case the Court of Criminal Appeals upheld the Fort Worth jitney ordinance, Judge Fisher ruled that, that where cases are similar it is the duty of the lower court to follow the higher court's ruling, but where the facts are not similar and there has been no ruling by the higher court, investigation and ruling in a case are within the right of the lower court. Judge Fisher ruled that the case of Partin was different in some of its particulars from the so-called Sullivan case.

Injunction against operators of some 300 jitney buses in Memphis, Tenn., having been denied the Memphis Street Railway in the local courts, an appeal has been taken to the State Supreme Court. An effort will be made to have the case argued before the sitting of the court at Knoxville in September. The street railway case does not involve the question of the constitutionality of the State law, which provides that municipal authorities may require \$5,000 indemnity bonds. This, however, has been raised in other cases now before the Supreme Court. In Memphis such an ordinance was prepared but has not been made effective, pending decision of the question.

The Quincy (Ill.) Street Railway has filed a petition with the State Public Utilities Commission of Illinois for the regulation of jitney buses in that city. The company desires that the jitneys be restrained from operating on the streets on which there are street cars. The date for the hearing has not been set.

The jitney bus ordinance was passed by the City Commission of Springfield, Ill., on Aug. 10. The ordinance provides for a bond of \$5,000 for cars carrying five or less passengers and an additional bond of \$500 for each additional passenger capacity. Before the new ordinance was read Commissioner Reece was given leave to withdraw the original ordinance, which has been slumbering in committee. The substitute provides that the following licenses shall be paid each year: For cars carrying five passengers, \$5; cars carrying from five to eight passengers, \$7; cars carrying from eight to ten passengers, \$10; cars carrying more than ten passengers, \$25. The license shall be paid October 1. Drivers of cars engaged in jitney service must secure a permit from the Mayor and Commission on payment of a fee of 50 cents, and are to be provided with a numbered badge, and the age for drivers is from eighteen to sixty years. Owners of cars who apply for licenses will be compelled to certify the route over which they are to drive. This section of the ordinance was opposed by the owners at a recent hearing, upon the ground that the enforcement of this section would make the cars common carriers and place them under the jurisdiction of the State Utilities Commission. Terminals will be established, but must be outside of the zone bounded on the north by Madison Street, the south by Capitol Avenue, the west by Second Street and the east by Eighth Street. Cars are allowed to stop for a period of not to exceed five minutes at crossings, and cars must be brought to standstill not less than 70 ft. from the crossing intersection. The cars are to be operated for at least six hours a day. Violation of the ordinance is punishable by a fine of not less than \$5 or more than \$200, and conviction may also bring automatically the revocation of the license. The ordinance will go into effect thirty days after its passage.

The Jitney Service Company, Williamsport, Pa., has requested the Public Service Commission for permission to withdraw its request for a certificate approving its incorporation. The reason stated is that the business of the jitneys in Williamsport has fallen so much that it was not deemed to be expedient to make further expenditures at this time.

In upholding an ordinance enacted by the Council of Independence, Judge Foran of Cleveland, Ohio, said that jitney bus owners must be required to give continuous service at regular intervals and must bear a portion of the taxes. He also suggested a \$10,000 bond and license fees. The court said that the jitney bus should be fostered within all reasonable limitations.

WISCONSIN JITNEY LAW

Summary of Provisions of Recent Measure Placing Jitneys Under the Jurisdiction of the Railroad Commission

The Governor of Wisconsin on Aug. 17 approved chapter 546 of the laws of 1915 relating to the operation of motor vehicles for the carriage of passengers for hire upon streets and highways. Except for two sections the act took effect upon passage and the measure in its entirety will go in effect on Sept. 1, 1915. The measure declares as a common carrier every motor vehicle affording a means of local street or highway transportation similar to that furnished by street railways and indiscriminately accepting and discharging passengers. Such vehicles are required to operate over such general routes or within such territory and during such hours as may be reasonably required for the accommodation of the public in accordance with the provisions of the measure. No vehicle is to be operated in passenger transportation unless there has been filed with and accepted by the Railroad Commission an indemnity bond issued by a security or indemnity company authorized to transact business in Wisconsin, and the bond must provide that the company issuing it shall pay all damages not exceeding \$2,500 to any one person or \$5,000 for any one accident resulting from the negligent use of the automobile. Applicants for permission to operate in Wisconsin must state their name and residence, the general route or the territory over which it is proposed to operate, the proposed hours of service and the rate of fare to be charged. Regarding the authority of the commission the law says:

"If the railroad commission shall determine that such bond complies with the provisions of section 1797-63 and that the rates specified in the application accompanying the same are reasonable for such character of service, and that the proposed general route, or territory to be covered, and the hours of such operation are reasonably adapted to the accommodation of the public, it shall, regardless of any other service now furnished, accept such bond and shall thereupon issue to such applicant a certificate setting forth the fact that the applicant has in respect to the vehicle described therein complied with the provisions of section 1797-63 and section 1797-64."

Any person who operates a motor vehicle in contravention of the provisions of the section of the law governing bonding, who transports in any vehicle a larger number of passengers than the number specified in the bond as the carrying capacity of the vehicle, who charges a rate of fare other than that prescribed in the application accompanying the bond, or who fails to operate the vehicle upon the general route or within the territory and during the hours set forth in his application, is to be deemed guilty of a misdemeanor and upon conviction be fined not less than \$10 nor more than \$100 for each offense and in default thereof may be committed to the county jail for not less than ten nor more than ninety days. Every city, village and town within or through which any motor vehicle is operated for public hire may require local consent for operation and as a condition of such consent may require reasonable compensation for the repair and maintenance of pavement and bridges and compensation for the regulation of street traffic and for any other expenses occasioned by the operation of the automobile.

LIMITS FIXED FOR PARCELS ON NEW YORK CARS

The Public Service Commission for the First District of New York has adopted a final order establishing rules and regulations to govern the carrying of parcels and newspapers upon the subway and elevated lines operated by the Interborough Rapid Transit Company, and upon the subway and elevated lines of the New York Consolidated Railroad Company, the Nassau Electric Railroad and the South Brooklyn Railway.

The regulations governing the Interborough Rapid Transit Company's lines allow the carrying of newspaper bundles in the rush hours under certain restrictions, prohibit the sorting of papers on the cars and the throwing of packages from the trains. In non-rush hours the restrictions are not as stringent. As to parcels other than newspaper bundles, passengers will not be allowed to enter any station with

bulky baskets or bundles, but only with ordinary hand satchels and parcels that can be conveniently carried on their laps or under seats without inconvenience to other passengers. No inflammable material will be admitted.

The regulations on the other lines permit the carrying of bundles of newspapers upon the platforms of elevated trains, but not inside the cars except between the hours of 2 a. m. and 6 a. m. Such bundles will be carried, subject to certain restrictions, which are formulated in the regulations. Passengers will not be allowed to carry very long or bulky articles or packages which are likely to cause accidents or serious inconvenience to other passengers. All articles which the guard thinks may be carried without danger or inconvenience and which are too large to be carried on the inside of the car, including bass drums and other articles for which special permits have been issued, must be kept on the platform in the custody of the owner.

All companies have been notified to file an amendment to their passenger tariff schedules to conform with the regulations. The proceedings which brought about the order were begun last May, after several persons with large bundles had been denied access to the subway and had complained to the commission. The Publishers' Association has already given its sanction to the order so far as it applies to newspaper bundles.

NEW TRAFFIC REGULATIONS PROPOSED

As a result of numerous investigations of street accidents involving automobiles and horse-drawn vehicles, extending over a period of several months the street traffic committee of the Safety First Society of the City of New York, has approved reports recommending new regulations, which it is believed will tend to minimize the number of preventable accidents occurring upon the public streets. The following recommendations, approved by the street traffic committee have been referred to William Bondy, general counsel of the society, with instructions to prepare the necessary ordinances for early introduction in the Board of Aldermen.

1. A new ordinance to provide for the elimination of dazzling head and side lights.
2. An ordinance requiring parallel parking at the curb for all vehicles of the delivery type.
3. An ordinance requiring the use of mirrorscopes on all motor vehicles operated in Greater New York. (New Jersey now requires the use of mirrorscopes.)
4. An ordinance requiring owners of all motor vehicles with chain drive to inclose the chains with suitable guards.
5. An ordinance making it a misdemeanor for any person to "hitch on" or trespass upon a motor truck or horse-drawn vehicle, unless employed by the owner of such vehicle.
6. An ordinance requiring that when a motor vehicle is at a stand-still and unattended, the vehicle shall be safeguarded as follows: (a) The motor of a gasoline propelled vehicle must be stopped; (b) on electric motor vehicles the control handle or the current cut-off switch must be locked so that the vehicle is rendered inoperative; (c) on all steam-propelled motor vehicles, the throttle or shut-off valve must be locked so as to render the vehicle inoperative; (d) the emergency brakes on a motor vehicle must be properly set so as to prevent such vehicle from moving.

The police department has been requested immediately to enforce the 8-ft. leeway law, the ordinance requiring lights on all vehicles. Among the members of the street traffic committee of the Safety First Society of the city of New York are George Keegan, general superintendent of transportation of the New York Railways, and J. A. Ritchie of the Interborough Rapid Transit Company.

SHOWING THE FARMER

A recent bulletin from the bureau of crop estimates of the Federal Department of Agriculture is in line with the argument which R. H. Wyatt, general freight agent of the Louisville & Interurban Railway, Louisville, Ky., has been presenting to the farmer patrons of the lines. One of the important features of the bulletin, which contains the findings of an investigation, is the statement that the average length of haul for the farmer who takes his produce to market by wagon is 6.5 miles, while the average time required to make the circuit is slightly more than half a day. For those farmers who are located beyond the normal radius

from their markets, not including the extreme cases, the average haul has been found to be 8.7 miles and the average time to make the circuit is three-fourths of a day.

Mr. Wyatt, discussing the proposition from the viewpoint of the Louisville & Interurban Railway, took the average figures, 6.5 miles and a half a day in time, and estimated that this represented a cost in time of man and team of at least \$2.50 on the average, of course, figuring that no team owner would sell services of man, team and wagon for less, while the average cost for hauling produce from all points on the company's lines to the freight depot, where the commission men would get it, he figured at between 50 and 75 cents a load. The commission man's charges would hardly be more than 50 cents on the average load, which would give the farmer a margin of between \$1.50 and \$1.25, out of which the costs of his delivery to the electric line would have to come, of course. But Mr. Wyatt figures it as a probability that the commission merchant's superior salesmanship and greater familiarity with the market would enable him to sell the produce to better advantage.

Two of the drawbacks to increasing the volume of this farm-to-market business, Mr. Wyatt said, are the distrust of the commission man by the farmer and the fact that the farmer has not been educated up to figuring comparative costs. Both of these are things the electric railway people will have to overcome before they will make much progress in taking over this farm-to-market business, Mr. Wyatt believes. His own propaganda along the line that the farmer's time in his fields is much more valuable to him, especially during the growing season, than it is on the road or in the market, is bearing fruit, and Mr. Wyatt is frequently asked for his reasoning on the proposition by producers along the lines of the company.

Gorge Lines Inspected.—The members of the Municipal Board of the Province of Ontario, with directors and engineers of the International Railway, Buffalo, N. Y., have inspected the Canadian line of the Great Gorge Route along the brink of the gorge and in the vicinity of the recent accident. The board will make a report as to suggested changes in equipment. The Attorney-General of the Ontario province will not take any action until after the report has been filed.

Skip-Stop Rejected in Newark.—The Board of Works of Newark, N. J., has disapproved the plan for skip-stops within the city proposed on behalf of Verona and other places near Newark. The motion that the board should not agree to any skip-stop was carried with the comment that the citizens of Newark should not be deprived of any transportation accommodations to which they were entitled. Residents of Verona, Montclair, Bloomfield, Glen Ridge and Caldwell are said to be considering a plan for the operation of a skip-stop service by the Public Service Railway in these places.

"Near-Side" Stop Agitation in Denver.—The "near-side" stop has come up as a subject of controversy in Denver, Col. The Denver Tramway is trying to secure an expression of opinion from the people, and has published a pamphlet to inform its patrons before they make a decision. A vote is to be held to see whether a "near-side" or "far-side" stop shall prevail at street intersections. The tramway has resorted to the popular vote before in order to settle controversies, particularly in connection with running express cars, and has accepted the majority opinion. The policy of frankness with the public and willingness to meet the majority opinion in cases of controversy is doing a great deal to keep the company in popular favor.

Courthouse Don'ts for Trainmen.—N. W. Funk, of the legal department of the Louisville (Ky.) Railway, in the last issue of *Trolley Topics*, makes the following suggestions under the heading of "Some Courthouse Don'ts." "Don't come in and take the witness stand chewing gum. Don't take the witness stand and chew your finger nails. Remember your testimony is the chief factor in our success or failure in the courthouse. A bad impression made on the jury by you cannot be cured by twenty disinterested witnesses. Many an employee will wonder why we have lost a case when we apparently have all the testimony. I have given you the answer. Don't guess wildly at speed. I have heard men state on the witness stand that they were going 1 m.p.h. between intersections. A man walking slowly goes

3 m.p.h. This sort of testimony will wreck the best defense in the world."

Unsuccessful Attempt to Compel Operation of Toronto Line.—The city of Toronto, Ont., through Works Commissioner Harris, made an unsuccessful attempt on Aug. 29 to secure from the Ontario Railway Board an order compelling the Toronto Railway to give a service on the new Ossington Avenue line. Mr. Harris pointed out that the delay of the city in completing the roadbed was due to difficulty in obtaining material, and claimed that but for the company's delay in laying tracks in the first place, the work would have been all done now. In any event, the line was quite safe for operation. Chairman McIntyre observed that the company held otherwise, and when the commissioner announced that he could produce evidence to prove that the line was safe, Mr. McIntyre informed him that the board's engineer had gone over the line and took the same view as the company's engineers. The operation of the line, accordingly, must wait until the city has completed the work of paving, which will be about Sept. 1.

Not a Fatal Accident in Louisville in a Year.—Results of the first year during which the safety-first work of the Louisville (Ky.) Railway has been in effect have been compiled by the company and show that the efforts of company and employees in eliminating accidents have been effective. In the first place the report shows that not one fatal accident has occurred on the city lines during the year, in the face of the fact that the company operated its greatest mileage and in the year carried a total of 100,000,000 passengers. There were four fatal accidents in the first half of 1914, before the safety-first movement got under way. In 1913 there were fifteen fatal accidents; in 1912 twelve, and eleven each in the two preceding years. In the case of the Louisville & Interurban Railroad the record is marred by one death, for which the coroner's jury held the company blameless. During the previous year there were six fatal accidents on the company's lines. Not only was the number of injuries to pedestrians reduced, but the movement was otherwise beneficial. Street car collisions were reduced by 62 per cent, and there was a reduction of 50 per cent in reports of persons falling in boarding or leaving cars or after leaving them. One item, the number of collisions between street cars and automobiles, shows an increase. This is attributed to the large increase in the number of automobiles. Since the inauguration of the police crusade against reckless motor driving, however, there has been a marked decrease in these accidents. There are sixteen lines in the city, covering 87½ miles of road. The mileage during the year was 11,897,848.

What the Interurban Has Done for Indianapolis.—Commenting recently on the growth of 38 per cent for Indianapolis and on 19 per cent for St. Louis during the last census decade the *St. Louis Republic* said: "A number of railroad systems are managed from St. Louis. Not one road of any size is managed from Indianapolis. St. Louis lies just across the Mississippi from the greatest deposit of good steam coal adjacent to any American city; Indianapolis gets its coal from considerable distances. St. Louis has a river channel connecting it with the sea; Indianapolis has no navigable water. St. Louis is located on rolling hills of great scenic beauty and giving ideal drainage; Indianapolis is as flat as the top of a dinner table. St. Louis is far from any other large city; Indianapolis has achieved its remarkable growth within 183 miles of Chicago. St. Louis has two important universities; Indianapolis has none. St. Louis is a wealthy city; Indianapolis has almost no large fortunes. St. Louis is the world's center in a number of lines of manufacture; Indianapolis has many small, prosperous shops, but few large ones. Fast interurban trolley lines have made it easy for the people of a circle of 250 miles in diameter to visit Indianapolis. In the streets of the capital, the man from Fort Wayne rubs elbows with the man from Terre Haute; the shopper from Columbus meets her old school friend from Logansport. A trolley map of Indiana looks like the spokes of a wheel whose hub is the city of Indianapolis. A city without great wealth, without large industries, without a university, without navigable water, without coal, without natural beauty of site, has grown because it made it easy for its neighbors for 100 miles around to drop in before dinner, per trolley car, and leaving after an early supper, to get home by bedtime."

Personal Mention

Mr. Daniel M. Shepler has been appointed superintendent of the Pekin (Ill.) Street Railway, controlled and operated by the city.

Mr. John M. Padgett, formerly with the Associated Press and the *Republican* at Denver, Col., for about two years with the *Daily Capital* at Topeka, Kan., has been appointed to the claims and publicity department of the Illinois Traction Company. He will handle work for the company's railways at Topeka, Wichita and Atchison.

Mr. William D. Ainey, Montrose, Susquehanna County, has been appointed chairman of the Public Service Commission of Pennsylvania by Governor Brumbaugh. Mr. Ainey, who was appointed a commissioner in the spring of 1915, has been acting as chairman, being the junior in the commission. The new chairman has served as a United States Congressman and was a member of the House committee on foreign relations. He was born at New Milford, Pa., and was graduated from Mansfield Normal School and Lehigh University. He was District Attorney of Susquehanna County for two terms until elected as a Congressional representative.

OBITUARY

J. C. Espy, superintendent of transportation of the Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio, is dead as a result of wounds self-inflicted, presumably in a fit of despondency brought about by the death of his wife and by his own failing health. Mr. Espy was for some time a locomotive engineer on the Lake Shore Railroad. Sixteen years ago he entered the service of the Cleveland, Painesville & Eastern Railroad as a motorman. After several years of service he was promoted to dispatcher, and five years ago was made superintendent of transportation of the company.

John R. Graham, president of the Bangor Railway & Electric Company, Bangor, Me., and one of the most prominent public utility men in the East, died at his summer home in Intervale, N. H., on Aug. 24. Mr. Graham was born in the north of Ireland in 1847. During the Civil War he served in Massachusetts infantry and cavalry regiments, and after the close of hostilities established a shoe factory at Quincy, Mass., which has since been continued by his sons. Mr. Graham entered the street railway field at the reorganization of the Quincy Street Railway and when that company was merged with the Old Colony system he became a vice-president of the latter. He was a member of the first rapid transit committee of the Massachusetts Legislature, established at Boston in 1893, was a member of the Quincy City Council for two terms, a director of the Quincy Electric Light & Power Company, and a trustee of the Quincy Savings Bank. In 1902 Mr. Graham engaged in the rehabilitation of the electric railway, lighting and power system at Bangor in association with the banking houses of J. & W. Seligman, New York, and E. W. Clark & Company, Philadelphia. Mr. Graham was also closely identified with the acquisition of the electric railways now forming the system serving the region between Waterville, Me., Lewiston and Bath. More recently he was instrumental in the formation of the Cumberland County Power & Light Company, Portland, Me., which now operates the electric railway and central station service of Portland and the surrounding region. Mr. Graham was a director of the Merrill Trust Company, Bangor; Union Trust Company, Ellsworth; president of the Bangor Power Company, the Orono Water Company, the Bar Harbor & Union River Power Company, and the Graham Realty Company. In July, 1914, he entertained the New England Street Railway Club at his hotel in Bangor and at his private and experimental farms in the outside country, the occasion being one of the most memorable in the history of the organization. He was an honored guest at meetings of the Massachusetts Street Railway Association, and in 1914 received a loving cup at a dinner at Young's Hotel, Boston, from former associates in the Legislature. Mr. Graham was twice married and leaves his second wife and ten children by his first marriage, one of whom, Mr. Edward M. Graham, is assistant to the president of the Bangor company.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Boise Valley Traction Company, Augusta, Me.**—Incorporated in Maine to construct and operate a railway by steam, electric or other motive power. Capital stock, \$1,000,000. Officers: Franklin P. Ferguson, Brooklyn, N. Y., president; E. M. Leavitt, Winthrop, treasurer, and E. L. McLean, Augusta, clerk.

***Salem-Pennsgrove Railway, Salem, N. J.**—Incorporated in New Jersey to construct a line from Salem to Pennsville and Pennsgrove. Incorporators: Arthur B. Smith and Isaac S. Smashey, both of Salem. [July 31, '15.]

FRANCHISES

Ceres, Cal.—The Tidewater Southern Railway has asked the Council for a franchise to extend its tracks through Ceres.

North Andover, Mass.—The Bay State Street Railway has received a franchise from the Council to extend its double tracks on Sutton Street, North Andover.

Westborough, Mass.—The Worcester Consolidated Street Railway has asked the Council for a franchise to relocate its track on Main Street, Westborough.

Cleveland, Ohio.—Petitions have been filed with the City Clerk of Cleveland asking for a referendum vote on the franchise granted the Cleveland, Akron & Canton Terminal Railway for a four-track freight subway under East Fifty-fifth Street, Cleveland. [July 31, '15.]

Portland, Oregon.—City Attorney La Roche has been asked by Commissioner Daly to prepare a council resolution, declaring the franchise of George F. Huesner to construct an interurban electric line from Kenton to the West Side Business District forfeited, and providing for proceedings to confiscate the \$10,000 bond furnished by Mr. Huesner to guarantee construction of the line. The franchise was granted to Mr. Huesner two years ago, and called for the completion of the line and starting of operations within eighteen months. This time has expired and nothing has been done toward construction. Mr. Huesner recently asked for an extension of time, which was denied by the Council.

Parkersburg, W. Va.—The Kanawha Traction & Electric Company has asked the Council for a franchise to lay double track on Murdock Avenue from Pottery Junction to Thirteenth Street.

TRACK AND ROADWAY

Phoenix (Ariz.) Railway.—This company has commenced taking up its double track on Roosevelt Street preparatory to changing the line to Fourth Street.

***Jonesboro, Ark.**—Plans are being considered to construct an electric railway from Jonesboro to Nettleton. Frank Weisbord, Indianapolis, Ind., is interested.

Pacific Electric Railway, Los Angeles, Cal.—The committee which was appointed a year ago to secure rights-of-way and subscriptions of money for condemnation proceedings, the purchase of depot sites, etc., which are to be turned over to the Pacific Electric Railway as a bonus for which it agrees to construct an electric railway to traverse the southeast section of Glendale and the eastern part of Tropic, reports that it has sufficient deeds to rights-of-way and subscriptions of cash to insure the construction of the road. The line will be 2½ miles long. A site has been purchased for depot, carhouse and park purposes. The total value of the depot sites and rights-of-way to be turned over to the company is estimated to be \$51,000.

Castro Point Railway & Terminal Company, Richmond, Cal.—The Railway Commission of California has issued an order authorizing the Castro Point Railway & Terminal Company to issue 890 shares of its capital stock of a par value of \$100 a share, to repay Blake Brothers \$18,403, the San Francisco Quarries Company \$21,070, and its attorneys

\$490. The balance is for other advances and for new construction on 2 miles of railway from the San Pablo quarry to a connection with the Richmond Belt Line Railway, all in Richmond. The company's capital stock is \$100,000, divided into 1000 shares, of which 110 are outstanding. It has no other evidences of debt.

Municipal Railways, San Francisco, Cal.—The Board of Works has contracted for all material needed for the construction of the Municipal Railway lines on Church Street and across Golden Gate Park, and is awaiting action by the Board of Supervisors before proceeding further. The contract for 9800 ties has been awarded to the Navarro Lumber Company. The Board of Supervisors has yet to decide the route for the line across the park, and has to declare whether the city will lay tracks on Market Street, from Church Street to Van Ness Avenue, or use the United Railroads tracks for that distance.

Illinois Traction System, Peoria, Ill.—This company suffered the loss of 300 ft. of track and the Coon Creek bridge, near Clinton, during the recent severe storm and high waters.

Aurora, Elgin & Chicago Railway, Wheaton, Ill.—This company is being urged to build a loop through the western part of Elgin. Such a loop would connect the Wing Park line with the North State Street line. The laying out of the North State Street tracks, which are now being placed on a lower level on account of new paving, is in accordance with the loop idea.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company is making preparations to build 60-ft. concrete poles to be used on its high-tension lines, especially at railroad crossings. Wooden poles have been used heretofore. The company has for the last five years used concrete poles of shorter length which have proved entirely satisfactory.

Tri-City Railway, Davenport, Iowa.—Double tracks are now being laid by this company on Seventeenth Avenue between First and Seventh Streets, East Moline. It is more than likely service to Campbell's Island will be discontinued on Oct. 15.

Hutchinson (Kan.) Interurban Railway.—Work has been begun on the extension of this company's tracks, which will be used by the Arkansas Valley Interurban Railway as an entrance to Hutchinson. The Hutchinson Interurban Railway will lay the track from Avenue A and Lorain Street south across its tracks, east on Carey Boulevard to the section line ½ mile east of Lorain Street and north to a connection with the Arkansas Valley Interurban line extending west from Burrton.

Wichita Railroad & Light Company, Wichita, Kan.—New track is being laid by this company on East Douglas Avenue east of Rock Island Avenue, Wichita. Concrete foundation will be used.

Cumberland Traction Company, Edmonton, Ky.—Work has been begun on this company's proposed railway between Edmonton and Elizabethtown. It is stated that the Greenup Electric Company, Elizabethtown, will supply the power for operating the cars and that the plans contemplate the completion of the road by the first of the year. Burkesville, Ky., interests are quoted to the effect that if the Cumberland road is built they will construct a 30-mile line from Burkesville to Edmonton to connect with it. [Aug. 21, '15.]

***Topsham, Me.**—Fred B. Teeling, Litchfield, is interested in a project to construct an electric railway from Topsham to Monmouth, to connect with the Lewiston and Waterville division of the Lewiston, Augusta & Waterville Street Railway at or near Tacoma. Mr. Teeling has presented his proposition to A. H. Ford, general manager of the Lewiston, Augusta & Waterville Railway, who has signified his interest in the project. Under the plan outlined, the road would start at Topsham or Brunswick, extending to Bowdoinham and Richmond Corner, through Litchfield, crossing the Lewiston, Augusta & Waterville Street Railway at Tacoma, thence to Litchfield Mills and Monmouth, a distance of 33 miles.

Worcester (Mass.) Consolidated Street Railway.—Work has been begun by this company repairing its tracks on Berlin Street, Clinton.

Detroit, Almont & Northern Railroad, Detroit, Mich.—Operation has been begun on this company's extension between Almont and Imlay. The company is being urged to extend its lines to Brown City and Marlette.

Grand Rapids (Mich.) Railway.—Work will soon be begun on the construction of an extension of this company's line on Plainfield Avenue, Creston, from the present terminal at Ann Street, N. E., to Knapp Street, N. E.

Jackson Light & Traction Company, Jackson, Miss.—The work of reconstructing this company's tracks on West Capitol Street has been completed.

***Opheim, Mont.**—It is reported that North country farmers, allied with the American Society of Equity, contemplate the construction of an electric railway from Opheim to Nashua. It is also reported the towns of Glentana and Baylor will join in the movement, which has for its principal object the gaining of more efficient means of transportation for farm products to the main line of the Great Northern Railway.

Public Service Railway, Newark, N. J.—Work has been begun by this company on the relocation of its tracks on Springfield Avenue between the Elmwood Avenue loop and Forty-third Street, Irvington. The tracks are to be shifted to the center of the roadway.

Trenton & Mercer County Traction Corporation, Trenton, N. J.—In connection with the repaving of West State Street between Calhoun and Prospect Streets this company is laying new ties and rails. The rails will be welded.

United Traction Company, Albany, N. Y.—This company is reconstructing and laying considerable new track in Albany and Troy. Rail weighing 70 lb. to the yard and 7-in. T-rail weighing 95 lb. to the yard is being used.

International Railway, Buffalo, N. Y.—New tracks will be laid by this company on Elmwood Avenue between Potomac and Forest Avenues, Buffalo. The company has agreed to remove one of the tracks of the abandoned line on Young Street between Main and Delaware Streets, the city to remove the other track. E. G. Connette, president of this company, announces that the directors of the system have decided to provide trolley service along Bailey Avenue on the east side. Tracks will be laid for part of the distance next year. The company has a franchise in the street and a year's extension was granted by the last Legislature.

Piedmont & Northern Railway, Charlotte, N. C.—Work has been begun by this company on the construction of a 1-mile extension at Charlotte to the Elizabeth Mill.

Cleveland (Ohio) Railway.—Work has been begun by this company on the extension of its Buckeye Road line from East 116th Street to East 130th Street, Cleveland.

Lake Shore Electric Railway, Cleveland, Ohio.—Plans are being considered by this company to double-track its line on West Erie Avenue, Lorain, between Ashland Avenue and the city limits.

Columbus Railway, Power & Light Company, Columbus, Ohio.—Plans are being made by this company to relay its tracks on Long Street and Main Street, Columbus. Mayor Karb has declared that the company must use grooved rails on these streets.

Mahoning & Shenango Railway and Light Company, Youngstown, Ohio.—Work has been begun by this company on the construction of its extension on East Washington Street, New Castle, to Cascade Park.

Oklahoma & Interstate Railway, Oklahoma City, Okla.—The Central States Construction Company has been chartered in Oklahoma with a capital stock of \$100,000 to build this company's proposed line to connect Tulsa, Miami, Collinsville, Joplin and other points. The incorporators are John R. Rose, J. R. Eldridge, G. C. Jones and A. G. Ritz, all of Oklahoma City. [April 17, '15.]

Bridgeburg, Ont.—It is reported that the plan to construct a hydro-electric line to connect Bridgeburg, Ridgeway and Fort Erie is being revived. W. G. Athoe, Ridgeway, is interested.

Philadelphia, Pa.—The contract for the construction of the City Hall station section of the Broad Street subway under City Hall and Market Street has been awarded by A. M. Taylor, director Department of City Transit, to the Keystone State Construction Company for \$1,700,000. The

contract for the construction of nearly 5 miles of concrete foundations for the steel supports of the Frankford Elevated Line from Callowhill Street to Unity Street was awarded to James D. Dorney for \$142,490. Construction work will be begun on Sept. 13. [July 10, '15.]

Scranton & Binghamton Railway, Scranton, Pa.—This company's extension from Foster to Brooklyn is practically completed and it is expected that cars will be running to Montrose by Dec. 1. Much progress has been made during the year on the extension to Binghamton.

Nashville & Eastern Railway, Nashville, Tenn.—DeKalb County has authorized the sale of \$150,000 thirty-year 4 per cent bonds, the proceeds to be invested in an equal amount of the capital stock of the Nashville & Eastern Railway. This practically assures the construction of the line between Nashville and Smithville. The bonds are to be issued and sold after the railway is completed and in operation. The Nashville, Chattanooga & St. Louis Railway will be electrified from Nashville to Lebanon and will connect with the extension to be built to Smithville. Charles Edwards, Nashville, is interested. (July 31, '15.)

Dallas (Tex.) Consolidated Electric Street Railway.—City Commissioners of Dallas have passed an ordinance granting Edward T. Moore of this company and associates ninety days' extension in the franchise ordinance covering trackage privileges for the proposed union interurban passenger station at Wood Street and Jackson Street. The plans include the erection of a ten-story building to be used as a terminal interurban station and office building for street car properties. Mr. Moore stated that several interurban interests entering Dallas have come to an agreement for the joint use of an interurban station and financial negotiations necessary to procure the money have progressed to an extent to assure the beginning of the work within ninety days, for which the extension was asked.

Galveston (Tex.) Electric Company.—Repairs have been begun on this company's line on which part of the track was completely washed out by the recent storm. A single-track pile trestle will be immediately built from Virginia Point on Galveston Bay to replace part of the causeway wrecked by the storm.

Houston, Richmond & Western Traction Company, Houston, Tex.—This company has awarded a contract to Moore & Son, Lufkin, to grade from the Brazos River to the city. [July 24, '15.]

Rutland Railway, Light & Power Company, Rutland, Vt.—New 80-lb. rail has been received and work will be begun at once by this company on the reconstruction of its tracks on Strong's Avenue, Rutland, between Madison Street and City Hall. The company is also placing new ties at various points on the main line.

***Richmond, Rappahannock & Northern Railway, Richmond, Va.**—Surveys have been begun by C. L. Ruffin, Richmond, for this company's proposed line from West Point to Urbana, 17 miles. The company was incorporated on July 30 with \$300,000 common stock and \$200,000 preferred stock. Officers: Warner Moore, president; H. L. Lewis, vice-president; R. H. Bruce, treasurer, and James Mullin, Jr., secretary.

Virginia Railway & Power Company, Richmond, Va.—This company plans to build double track on Fourteenth Street from Mayo Bridge to Cary Street, Richmond.

Olympia Light & Power Company, Olympia, Wash.—Mayor Mottman and the Council have ordered this company to move its tracks on East Fourth Street from the north side to the center of the street.

***Washington Electric Company, Olympia, Wash.**—The State Highway Commission has granted to this company a railroad right-of-way 15 miles southeast of Chehalis in Lewis County, where it is reported an electric line will be built.

Puget Sound Traction, Light & Power Company, Seattle, Wash.—An ordinance has been passed by the Council for the establishment of the proposed grade separation at Argo, and a date will be set in the immediate future for the hearing of the interested property owners and various railroad companies involved, which include the Puget Sound Traction, Light & Power Company, the Oregon-Wash-

ington Railroad & Navigation Company, the Great Northern Railway and the Chicago, Milwaukee & St. Paul Railway. The work will cost approximately \$450,000, and will be borne by the companies named. A concrete tunnel 1700 ft. long is included in the improvement.

Monongahela Valley Traction Company, Fairmont, W. Va. It is reported that this company is considering the extension of its line to New Martinsville to connect with the lines along the Ohio River. One survey is between Mannington and New Martinsville and another between Lumberport and New Martinsville, but no decision has been reached as to which will be used. Either of them would connect Fairmont and Clarksburg with the western terminus. Another proposed line extends from Weston to Glenville, and another line which has been surveyed extends from Clarksburg to Buchannon. Surveys have also been made between Clarksburg and Philippi and some rights-of-way have been secured.

Ohio Valley Electric Railway, Huntington, W. Va.—It is reported that this company plans to build an extension from Ashland, Ky., north to Russell.

Pan-Handle Traction Company, Wheeling, W. Va.—This company is repairing its track between Warwood and Wellsburg.

SHOPS AND BUILDINGS

Shore Line Electric Railway, Saybrook, Conn.—Plans are being prepared by Cudworth, Woodworth & Thompson for the construction of a new carhouse to be erected by this company on the site of its old carhouse in Thamesville, destroyed by fire last fall. The building will be 60 ft. x 250 ft. and will be constructed of brick.

Joliet & Eastern Traction Company, Joliet, Ill.—Work will be begun soon on the new carhouse of this company at Frankfort, Ill. The building will be of concrete construction and will provide storage for four cars. There will also be repair shops in the building where cars of the eastern division will be repaired.

Pekin (Ill.) Municipal Railway.—This company will build a carhouse on the ground recently purchased for that purpose in the Rosedale addition to Pekin.

Kankakee & Urbana Traction Company, Urbana, Ill.—This company has completed and is now using a new modern passenger and freight station at Rantoul, Ill.

Arkansas Valley Interurban Railway, Hutchinson, Kan.—Plans are being prepared by Crowell & Van Meter, Wichita, for the construction this fall of a \$10,000 terminal by this company. The structure will be two stories high and will be of brick and stone.

New York Municipal Railway Corporation, Brooklyn, N. Y.—With the approval of the Public Service Commission for the First District of New York, the New York Municipal Railway Corporation has awarded to John Thatcher & Son the contract for the construction of stations in connection with the third-tracking work on the Broadway elevated line in Brooklyn, for \$320,325. The contract calls for the construction of stations at Hewes Street, Lorimer Street, Flushing Avenue, Myrtle Avenue and Broadway, Kosciusko Street, Gates Avenue, Halsey Street and Chauncey Street. All these stations are on the Broadway line between Havemeyer Street and East New York, where the third-tracking work is already under way. The commission has awarded the contract for the construction of station finish on Section No. 2 of Routes Nos. 36 and 37, the Astoria elevated line in Queens Borough, to Charles Meads & Company, the lowest bidders, for \$268,192.

Cleveland & Youngstown Railway, Cleveland, Ohio.—Petitions have been filed with the city clerk of Cleveland asking for a referendum vote on the franchise granted this company for a freight terminal at Broadway and Orange Avenue, Cleveland.

POWER HOUSES AND SUBSTATIONS

Shore Line Electric Railway, Saybrook, Conn.—This company has completed plans for a brick and concrete power station, 45 ft. x 80 ft., 25 ft. in height.

Illinois Traction System, Peoria, Ill.—This company has received four new transformers for use in its substations at St. Joseph, Ill. The plant will be rearranged at the time the new transformers are installed.

Manufactures and Supplies

ROLLING STOCK

Alton, Granite & St. Louis Traction Company, St. Louis, Mo., is reported as expecting to purchase new cars of a modern type to be used between Alton and St. Louis.

Manchester (N. H.) Street Railway has placed in service a new closed car, built in its shops. Another car is being constructed and will probably be in operation in two months.

Anaconda (Mont.) Street Railway, noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21 as having ordered six new 50-ft. cars, has placed this order with the St. Louis Car Company.

Danville Street Railway & Light Company, Danville, Ill., has placed the third pay-as-you-enter car in service in this city, this car to be run on the West English and the Soldier's Home line.

Southwestern Gas & Electric Company, Texarkana, Tex., is about to receive three 21-ft. steel car bodies which have been built by the St. Louis Car Company. They are of the pay-as-you-enter, double-end vestibule type, equipped with GE-54 motors and Brill 21-E trucks. On May 15 this railway placed in service three cars built by the same company. These cars are of pay-as-you-enter type, 28 ft. long, double truck, steel bodies, equipped with GE-201 motors and Brill 39-E trucks.

TRADE NOTES

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, has received an order for the complete equipment of the Seattle, Renton & Southern Railway's cars with thirty SR-95 "Golden Glow" headlights. An order for equipping half of the interurban cars of the Atlantic City & Shore Railroad, using "Golden Glow" T-128 headlights has also been received. The Savannah Electric Company has ordered twelve SR-95 headlights for its suburban cars.

Duff Manufacturing Company, Pittsburgh, Pa., manufacturer of the well-known Barrett lifting jacks, is building an extension to its main factory building, 150 ft. x 125 ft. in width. With the extension the main building will be 625 ft. by 125 ft. wide, and will contain the most modern equipment. A 5-ton bridge transfer crane and monorail conveying system is also being installed, together with considerable additional equipment. All equipment has been purchased and is being installed.

Bertram Smith, well known in the storage battery business for the past fifteen years, has been appointed manager of the Detroit office of the Edison Storage Battery Company. About a year and a half ago Mr. Smith joined the Edison interests as assistant manager of the Edison Storage Battery Supply Company of San Francisco, the distributor for the Edison nickel-iron-alkaline battery on the Pacific Coast. Directly previous to his connection with the Edison company he was manager of the battery department in the Chicago branch of the United States Light & Heating Company. He was formerly secretary and treasurer of the National Battery Company of Buffalo until its consolidation with the United States Light & Heating Company. In order to better serve its customers in eastern Michigan, as well as Ohio and adjoining territory, the Edison Storage Battery Company recently moved its Cleveland office to Detroit, where it has located in the new David Whitney Building.

Thomas W. Casey has been elected vice-president and a director of the National Pneumatic Company of Chicago and New York. Mr. Casey will also be general sales manager of the company and will have charge of the sales office which will be located in New York City. Mr. Casey has been prominently identified with the popularizing and exploiting of the prepayment car from its inception into the United States, having come from Montreal with the first pay-as-you-enter car which was exhibited at the American Electric Railway Association convention held in Columbus, Ohio, in 1906. Mr. Casey was general manager of the Pay-as-You-Enter Car Corporation, and after the merger of that corporation with the Pay-Within Car Company

in March, 1911, when the Prepayment Car Sales Company was formed to carry on the work, Mr. Casey was elected president of the new organization, and since that time the work has been carried on under his direction. Having decided to enter the manufacturing field he has joined the force of the National Pneumatic Company. Mr. Casey has a thorough knowledge of the electric railway business, especially in the mechanical line, having been connected with the Montreal Street Railway Company for upwards of seventeen years in various positions, being general purchasing agent at the time he resigned from that company. Prior to going with the Montreal Street Railway Company Mr. Casey was employed on the Canadian Pacific construction under the late Sir James Ross.

ADVERTISING LITERATURE

D. & W. Fuse Company, Providence, R. I., has issued a catalog relating to the design and construction of its inclosed fuses. The catalog discusses the external appearance of the fuses, describes the link constructions of the various kinds, explains the filling of the fuses and finally contains an account of the mechanical methods employed in their construction.

S. K. F. Ball Bearing Company, New York, N. Y., has issued Bulletin No. 15 on the characteristics of ball bearings for automobile worm drives. The catalog describes the simplicity of the bearing construction, the ease with which the bearings are mounted and assembled, and their noiseless operation and efficiency. The proper method of lubrication for worm drives and the calculation of end thrust and radial loads are also explained.

The Engineer, London, England, has issued its regular annual directory, the contents of which include an abridged index to the editorial columns of *The Engineer*, from January to December, 1914, a list of technical terms in French, German, Italian and Spanish for use as a foreign buyers' guide, an iron and steel trade directory and buyers' guide, including telegraphic addresses and telephone numbers of firms included in the buyers' guide and a list of standard and new technical books.

E. I. duPont de Nemours Powder Company, Wilmington, Del., has issued a valuable booklet entitled "Road Construction and Maintenance." Although the booklet deals broadly with this subject, it includes information of special interest and value to the electric railway construction and maintenance of way engineer, owing to the helpful instructions which it contains on the proper methods of blasting for the construction of rights-of-way and pole holes. The process of loading poles for blasting is clearly described with the aid of diagrams, and illustrations of the blasting supplies required.

Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has issued a reprint of an article which appeared in the July issue of *The Foundry*, and entitled "How Titanium Aluminum Bronze Is Produced." The article is well illustrated with views of the modern equipment and facilities of this company's plant at Niagara Falls, N. Y., for making and testing this valuable alloy. This company makes a full line of brass and bronze castings and also specializes in the manufacture of high-grade bronzes. Where special requirements are presented use is made of a research or experimental foundry department equipped with both coke and electric melting furnaces and controlled, as is the production foundry, by complete chemical, physical and microscopical laboratories.

Carnegie Steel Company, Pittsburgh, Pa., has issued a pamphlet entitled "Structural Beams," second edition, dated as of August 1st, 1915, which covers a new line of sections supplementary to the American standard beam sections. In recent years, especially in the construction of modern office buildings and buildings intended for light machine shop work, it has frequently been found desirable to use deeper beams than required for safe carrying capacity as determined by the floor loads required by the building laws of various cities with a result that the full strength of a standard beam section is not always developed. It was natural that in the endeavor to meet this condition designers should follow the outline of the American standard profiles which, in turn, were based on the original German

normal profiles, and in consequence light weight sections have been made heretofore with the flanges of the same width and taper but somewhat thinner and also with thinner webs than the minimum weight American Standard sections. The beam sections illustrated in this pamphlet constitute, however, a radical departure from those profiles as regards width, slope and thickness of flanges: the 24-in. beam with a width of 9 in. as compared with the 7-in. of the American Standard section. The 12-in. beam has a flange width of 6 in. as compared with the 5-in. width of the American Standard section. The 27-in. beam is made with the same flange width as the 24-in. beam, but the flange widths of the other sections follow the depths in a gradual sequence; the slope of the flanges is uniformly 1 in 11. The carrying capacities of these sections are theoretically somewhat less than the carrying capacities of the corresponding minimum weight standard sections. Pound for pound, however, the metal has equal if not greater efficiency with the additional advantage that the new sections have somewhat greater lateral stiffness due to the greater width of their flanges. There is no 20-in. beam in this new series which is graduated by intervals of 3 in. in the sizes, 12 in. deep and over.

NEW PUBLICATIONS

Resuscitation from Electric Shock, Traumatic Shock, Drowning, Etc. By C. A. Lauffer, M. D., medical director, Westinghouse Electric & Manufacturing Company. Second edition, enlarged. John Wiley & Son, Inc., New York. 90 pages. Price 50 cents.

This is a revised reprint of the paper presented by the author before the Philadelphia Electric Company Section, N. E. L. A., in 1912, and explains the prone-pressure or Schaefer method of inducing artificial respiration, including complete directions for self-instruction.

The Act to Regulate Commerce Construed by the United States Supreme Court. By Hubert Bruce Fuller. John Byrne & Company, Washington, D. C. 585 pages. Buckram, \$6.

This book is intended to collate and to discuss the decisions of the United States Supreme Court on the interstate commerce act. While primarily a treatise for lawyers, it is not beyond profitable perusal by laymen who desire to know how rate, traffic and similar questions arising under the act are being construed by the court of last resort. To railroad officers, shippers, bankers and investors, the book is an invaluable compilation of needed information.

Graphical Determination of Sags and Stresses for Overhead Line Construction. By Guido Semenza, consulting engineer, and Marco Semenza, electrical engineer, both of Milan, Italy. Translated from the Italian by C. O. Mailloux. McGraw-Hill Book Company, Inc., New York. Twenty-four pages of text, with many inserted charts printed on bond paper. Cloth, \$3 net.

This set of charts with explanations is designed for the use of men engaged in line construction. The charts are plotted from formulae which are derived and explained for the benefit of those who care to follow the theory, but the charts can be used without a knowledge of this theory. The method followed by the authors includes provision for ice and wind loads, temperature changes, difference in elevation of spans, etc.

Alternating Current Electricity and Its Application to Industry. By W. H. Timbie, head of the Department of Applied Science at Wentworth Institute, and H. H. Higbie, professor of electrical engineering at the University of Michigan. John Wiley & Sons, Inc., New York. 534 pages. Cloth, \$2 net.

The authors have incorporated in this text-book on the elements of its subject the results of years of successful teaching experience. It represents an earnest attempt to assist students to secure a working grasp of a difficult subject by making it tangible. The book abounds in analogies and practical problems, and wherever possible pictures of commercial apparatus are introduced. While intended as a text-book for students with a very elementary knowledge of the elements of electricity, it could be studied with profit by electrical workers who are familiar with the fundamentals of physics, algebra, geometry and trigonometry.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.

Consolidation of STREET RAILWAY JOURNAL JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, SEPTEMBER 4, 1915

No. 10

AN OPPORTUNITY FOR SALESMEN

A very interesting suggestion, which should appeal to the managers of electric railway properties, particularly small ones, was recently received by the editors from the superintendent of a railway and lighting company in the Middle West. The suggestion is simply that visiting salesmen be invited to talk to groups of employees interested in the salesmen's specialties. The plan has been tried on this property with good success, and undoubtedly the same idea has occurred to managers elsewhere. The modern salesman in this field is particularly well qualified to describe recent developments in the several lines of electric railway work. By the very nature of his work he must be up to date, and if he is successful in selling goods he must be enthusiastic regarding them. He has at hand exactly the information regarding railway supplies which operating men want and, as the average salesman is a fluent talker, he should have no difficulty in presenting this information attractively. If he will confine his remarks to topics on which he has first-hand information he is assured of the attentive interest of his audience. Here is a simple educational opportunity which requires no organization, would yield good results to all concerned, and would cost nothing to put into operation.

REAL DIRECTORS NEEDED

The caustic comment of the Interstate Commerce Commission in regard to the Rock Island board of directors adds one more authority on the side of those who assert that corporations have a vital need for directors who actually direct. We have long believed that too great a premium is placed upon the board membership of "big" men, chosen because of the glamor of their names rather than for the time, energy and enthusiasm that they can bring to their work. It is not a question of ability to direct in the case of the man of large affairs, but of his tendency to abuse his ability by accumulating so many directorships in addition to his regular business that he cannot acquire and maintain the close insight into the properties that a real business-minded director should have. "Big" directors are prone to acquiesce, without knowledge or investigation, in what certain others more directly concerned with the management of the property desire to have done, forgetting that a directorship is a position of trust and that any dereliction or neglect of responsibility therein is the more to be condemned as the prominence and the business sagacity of a director increase. We believe that no corporation should choose, and no man should accept a position as, a director unless he

is prepared to acquaint himself thoroughly with the commercial, technical and public policy problems of the company. Furthermore, the board of directors should be small enough to permit frequent convening and prompt action—seven or nine members are quite sufficient in most cases. A board thus constituted would be organized for work and not for show.

REDUCING WAGES BY ARBITRATION

The decision of the board of conciliation and investigation in the British Columbia Electric Railway wage arbitration is vitally important to all electric carriers, for it is an excellent example of the use of the Canadian industrial disputes act as a means of lowering wages as well as of increasing them. The theory underlying the decision, however, is not altogether satisfactory. The points at issue were easily proved—the general business depression in Vancouver has led to a wide-spread wage reduction, the cost of living has decreased, the financial condition of the company is making it unable to continue the old wage rates, and since 1913, in spite of the depression, the wages, because of the sliding scale, have advanced about 8 per cent. Yet of the desired 15 per cent reduction only an average of 7 per cent is recommended by the board, with reasoning that seems to be a compromise on basic principles. The board concluded that the financial standing of the company should not be a governing or controlling factor in recommending wage rates, yet it remarks that an outline of the company's financial condition is wise as showing that the company is not in a position "to deal liberally" with its employees. In dealing with a prosperous company are we to suppose that the board would adhere to this principle that the financial standing is not a controlling factor, but would analyze such standing to show that the company could, if it so desired, deal "liberally" with its employees? Financial standing should or should not be considered—there should be no vacillation on this point. Incidentally, we may say, it should be considered until some system of control causes increases in wages to be automatically followed by equal increases in rates. The board in the present case believes in a "fair wage based on proper conditions"—this apparently under the general depression and lower cost of living means about 7 per cent less than existing wages. We wonder if this figure, however, did not easily come from simply reverting in general to the 1913 wages, in spite of the expressed approval of the board for the general principle of the sliding scale system, which had caused the increase since 1913. In short, while the reduction is gratifying,

we are sorry that the board has not met with greater exactness and clearness the issues raised, for they merited an exhaustive and authoritative study.

ELECTRIC RAILWAYS AND THE JITNEY BUS

In a recent issue of the *American City*, Dr. Clyde L. King, the author of an article on the jitney in our issue for Aug. 21, discusses the probable effect of the jitney upon street railways. He concludes that "the jitneys will probably not seriously disturb the existing business of street railway companies, while they can be used to develop new business and to give the cities more elastic and more rapid transit facilities." This conclusion is based upon a consideration of the cost limitations of jitney development, the new avenues of transportation that will be opened up by both the jitneys and the larger buses, and of the facts that each type of transit tends to develop its own customers, that the jitney probably picks up many pedestrians who would not otherwise use the street cars and that the "riding habit" tends to increase more rapidly than the population. He adds, "That the jitney and the motor bus should be regulated, goes without saying. As a minimum, permits should be required, routes and fares specified, and minimum provisions for public safety and convenience enforced. Chauffeurs should pass an examination and be licensed, cars should be periodically examined, and requirements for driving and for loading and unloading should be enforced. Reasonable bonds may well be required to insure indemnities in case of accidents, limitations should be placed on overcrowding, * * * definite routes should be required, and destinations plainly indicated in large letters." He also recommends a special pavement tax based on the use of the streets and the additional cost of repairs to the pavements caused by jitney bus operation. If these conditions are enforced the jitney will begin to assume the aspect of a real public utility, not full fledged, perhaps, but at least incubated.

The position of the ELECTRIC RAILWAY JOURNAL on this subject was clearly stated in an editorial printed in the issue for July 3 where we expressed the belief that bus lines operating under electric railway conditions will not be permanently profitable. If the jitney or the auto bus should look for chances to serve where the street car cannot operate, it would be a welcome addition to the transportation needs of a community and might prove, in many cases, profitable to the operators. But it is cold comfort to be told that under the conditions under which these cars have been operated the existing business of street railway companies will not be seriously disturbed. The trouble has been that the jitney has thrived by skimming the cream from the business of the electric railway and has forced upon the latter an unfair proportion of the long-haul business. Professor King fears that the street railway companies will aim to have the tax on jitneys so high as to be prohibitive, but he recommends himself for the jitneys in addition to the requirements already mentioned, transfer provisions, limited franchises, police traffic regulation, limitation of traffic to designated

roads of proper stability and character, efficient safety fenders and standardization and publicity of accounts. We have no fear, if the regulations on all of these points are at all as stringent as those applied to electric railways, that the motor bus will find that it can no longer compete with electric cars and will assume its proper place, namely, as a supplement to electric railway service rather than as a competitor to it, or else will drop out.

THE 1915 CONVENTION PROGRAM

The American Electric Railway Association is to be congratulated upon the early completion and announcement of its convention program, printed in full in last week's issue of the ELECTRIC RAILWAY JOURNAL. The members of the association little realize the labor involved in making up such a program and in marshalling the committee reports and addresses for actual presentation. Close scrutiny of the program will reveal a very ingenious dovetailing of the sessions to provide for overlapping where mutual interest makes joint consideration of certain topics desirable. Those who have followed week by week the reports of committee activities as they have been recorded in this paper must appreciate the substantial value of the work done this year. Never have there been more important reports to be considered and never have they been presented more systematically and effectively.

The industry looks to the annual convention program to reflect its live problems. Topics and speakers are selected with a view to stating the problems clearly and pointing out fundamentally correct solutions for them. The topics selected for consideration by the American Association this year are, therefore, significant. These topics are government ownership, principles of valuation, and welfare work, and these are to be discussed by Ex-United States Senator Jonathan Bourne, Jr., Bion J. Arnold and Jesse W. Lilienthal, respectively. It is interesting also to note the topics which are to take the attention of the affiliated associations. The accountants this year are to discuss their ideas of the prepayment car, under the leadership of R. J. Clark, and the more technical subject of the treatment of charges for rent of track and equipment will be presented by Paul Shoup. Two professors are to address the accountants, and these speakers are apparently left free to make their own selection of topics. The engineers, too, are this year calling in outside experts to give them the benefit of the government researches into wood preservation. At Madison, Wis., a federal laboratory is maintained for the conducting of researches on the properties of forest products. The electric railway industry has much to gain by close co-operation with this laboratory. In addition to papers on technical topics the Claims Association is to consider broadly the subjects of automobiles, and safety and its relation to conservation. The claims departments of electric railways "have magnified their office" in recent years by reaching out into the field of conservation of life with the idea of reducing claims to the minimum. The program of the Transportation & Traf-

fic Association is also replete with interest, with one outside address and committee reports on subjects of great concern to the industry.

In commenting upon the 1914 program we called attention to a tendency to reduce the number of addresses and papers, as pressure for program space for the presentation of the committee reports became greater. While the idea was not expressed at the time, we had supposed that the limit had about been reached with a reduction of 40 per cent in the number of papers over the preceding year. That this is not so is indicated in the present program where the number is still further reduced. It seems to us most profitable to occupy the larger part of the convention time with careful consideration of committee reports, the balance being devoted to inspirational and technical addresses, few in number but comprehensive in scope and powerful in inception and in delivery.

CO-OPERATION IN "MISSIONARY WORK"

In encouraging manufacturers to build within their territory electric railway companies should co-operate with the local electric light and power companies in deciding what factory locations will be most economical for themselves as regards distribution of current, construction of new transmission lines and track and convenience of handling transportation. Having made this agreement they may then jointly, and therefore more effectively, describe to the prospective manufacturer the special local facilities afforded by natural resources, convenience of location and cheapness of light and power and of freight transportation. When these companies are under a single management with a common source of current supply, the matter is, of course, simplified. A still more economical arrangement is possible for the holding company interested in several electric properties. In this case it would be more profitable for the management to attract a residential population to one of its railway properties which specializes on passenger transportation, while manufacturers should be drawn toward a property capable of industrial development where an adequate equipment for handling electric railway freight is provided and where, if possible, cheap hydroelectric power may be obtained.

An example of successful co-operation was recently shown by the railway and power companies of a certain small-sized city, just outside of which lay a large undeveloped slate quarry. Representatives of the local electric companies succeeded jointly in interesting the investor in a process for grinding slate into a roofing material by selling him on the installment plan a plot of land for a factory and agreeing to build a freight siding alongside of the plant. Reasonable rates were granted for electric freight transportation and electric power. At one time the obligations of the manufacturing concern to the electric companies amounted to \$12,000. This amount, however, was all paid back out of the earnings of the thriving industrial, which had increased its monthly payments for electric service from only \$40 the first month to \$1,800 two years later.

CARS AT LESS THAN COST

We are in receipt of a letter from a car builder who says: "If a railway man believes that he is entitled to a fair return on his investment, why is he so pleased when he cajoles a feeble-minded car builder into accepting an order for cars in ruinous competition at less than the cost of manufacture? If selling transportation at less than cost is an economic crime, why is not buying cars at less than cost an accessory to a similar crime? If the ELECTRIC RAILWAY JOURNAL protests against the one, why should it not also protest against the other?"

We do. We believe that cut-throat competition among supply dealers is just as disastrous in the long run for the purchaser as it is for the seller, and this is so whether the articles sold are car bodies, or anything else a company uses. No business can continue unless it makes a fair return on the investment. If the condition of the car-building business is such that the manufacturer who is favorably situated for manufacturing and uses economical methods cannot sell his output at a sufficient profit to pay a good return on his investment, the railway companies will ultimately suffer. Builders will have to turn to other lines of work, and when the demands for cars come, the few car-building companies which remain will be able to charge very high prices. Railway companies have a vital interest in the continued prosperity of those from whom they purchase supplies.

In stating this conclusion, however, we must not lose sight of the differences in underlying principles of the business conducted by a public utility and by a manufacturer. The prices at which the utility sells its service are fixed by law; those at which the manufacturer sells his product, by competition. The law says to the utility: "We guarantee you a monopoly of your business. The service which you sell is a necessity, and if you fixed your own prices the consumer would have to pay them no matter what they are. Hence you shall charge only so or so much." The manufacturer, on the other hand, can charge anything that he wishes, and no limit is set to the profits which he may make. If the railway is limited by law or by the action of public service commissions to its possible profits, it should have some assurance from the State that the prices which the State sets for its service should not be so low that the company cannot earn a fair return on a fair investment. There is no limit under the law for the prices which a manufacturer may receive for his products or for the profits which he can make, and, in return, there is no warrant under the law which will assure him even a fair return on a fair investment.

For these reasons the legal situation, so far as the manufacturer and the public utility are concerned, is radically different. But this does not change the business condition that the railway companies are not permanently benefited when the situation is such that for any considerable time they can purchase apparatus at less than the cost of its manufacture under economical conditions.

Steel Cars for Chicago & Milwaukee Electric Railroad

These All-Steel Interurban Railway Cars, Which Are Designed for High-Speed Train Operation, Are Built Without Continuous Center Sills and Are Provided with Extensible Vestibule Trapdoors for Use with Raised Station Platforms Having Various Clearances

The Chicago & Milwaukee Electric Railroad is about to place in service fifteen all-steel, double-end cars which are being delivered at the present time by the builders, The J. G. Brill Company. The cars are intended for high-speed interurban service, and they are constructed with corresponding strength, but they possess the unusual feature of an underframing without continuous center sills, the buffing and pulling strains being transferred to the side girders. The over-all dimensions conform to the clearance requirements of the Northwestern Elevated Railroad, to which the Chicago & Milwaukee Railroad connects and over which the interurban line may have occasion to operate to obtain entrance to the Chicago loop district. Owing to the presence of the raised station platforms over part of the route, vestibule trapdoors have been provided, these being arranged because of clearance variations so that they will slide outward when necessary and thus fill any gap between the station platform and the car.

For the present, the cars will be used in an hourly limited train service between Evanston, Ill., and Milwaukee, Wis., a distance of 73 miles. The limited trains in this service run through the densely populated suburban section immediately north of Chicago and through a number of manufacturing centers between this district and Milwaukee. Present schedules require two hours and eighteen minutes to make this run, which contains a maximum of twenty stops, but with the new equipment it is planned to reduce the time to one hour and fifty-five minutes. With this fast schedule, speeds up to 65 m.p.h. will be the rule, single cars and multiple-unit trains being operated according to the varying requirements of the daily service.

STEEL FRAMING DETAILS

The car bodies contain the customary main passenger and smoking compartments and a saloon. There are vestibules at each end, and a corner of each of these is partitioned off to form a motorman's cab. The general dimensions are shown in the accompanying table.

The most striking feature in the design is the omis-

sion of continuous center sills between buffers. Although this constitutes a novelty for interurban service it conforms to the most modern practice in the design of the side-girder steel cars because it permits a more uniform distribution of the buffing and pulling strains throughout the car frame and provides, at the same time, a relatively light-weight structure. Details of the underframe are shown in one of the accompanying illustrations. In this it will be noted that two 6-in., 23.8-lb. girder-beam center sills transfer the buffing strains from the anti-climbers to the car-body framing. These beams are spaced on 28-in. centers, and they extend only from the anti-climbers to the first underframe panel points inside the body bolsters.

To provide against the destructive effect of collisions the vestibule underframing is made particularly heavy. The two girder-beam center sills under the vestibule have a $\frac{1}{8}$ -in. top cover plate riveted to them, and that portion of the vestibule between the circular 6-in., 10 $\frac{1}{2}$ -lb. channel buffer and the step openings also is covered with $\frac{1}{8}$ -in. plate. The vestibule framing above the underframe is substantially built, the end door openings being formed by 6-in., 13-lb. channels riveted between the center sills and the 3 $\frac{1}{2}$ -in. x 2 $\frac{1}{2}$ -in. x $\frac{1}{4}$ -in. angle deck plate, which is made continuous across the end of the car.

The arrangement of the structural steel members in the body-bolster panel is rather unusual and results in a very rigid, shock-absorbing structure. The two heavy girder-beam center sills, in connection with two 6-in. x 3 $\frac{1}{2}$ -in. x 5-16-in. side-sill angles, form the longitudinal members. These are held rigidly in position by 4-in. x

CHICAGO & MILWAUKEE CAR—EXTERIOR VIEW

4-in. x 5/16-in. angle diagonal braces riveted between the outer corners of the underframe bolster panel and the point where the bolster connects to the girder-beam center sills. To give these diagonals additional stiffness under compressive strains, they are tied at the middle to the center sills by 2-in. x 1 1/2-in. x 3/16-in. angles.

End sills are formed of 6-in., 10 1/2-lb. channels, and to give them additional lateral stiffness these are provided with 1/2-in. x 6-in. cover plates which are securely riveted to the top and bottom flanges and to the side sills. The floor beam at the first panel point inside the body bolster is a heavy member, being formed of an 8-in., 11 1/4-lb. channel. The center sills are riveted to one side of this channel and the members of the floor system in the three central panels of the car-body underframing are riveted to the other. From the rigidly constructed bolster panels at each end of the underframe, buffing and pulling strains are transmitted to the central panels, which are also braced diagonally. The longitudinal floor-system members in these central panels are formed by two 5-in., 9-lb. channels spaced on 36-in. centers. Two transverse 3-in., 4-lb. channel cross-bearers to each set of diagonals also aid in stiffening the underframe between the bolster panels.

Structural steel shapes arranged for fifteen windows on each side are used in framing the car body. The side girder is formed of 1/8-in. plate 3 ft. 3/4 in. deep which is riveted to a 6-in. x 3 1/2-in. x 5/16-in. side-sill angle at the base, and to the 4-in. x 1/2-in. dropper bar at the belt rail. T-beam window posts on 2-ft. 11-in. centers are continuous from side sill to side sill. The letterboard is formed of two angles and a 10 1/2-in. x 1/8-in.

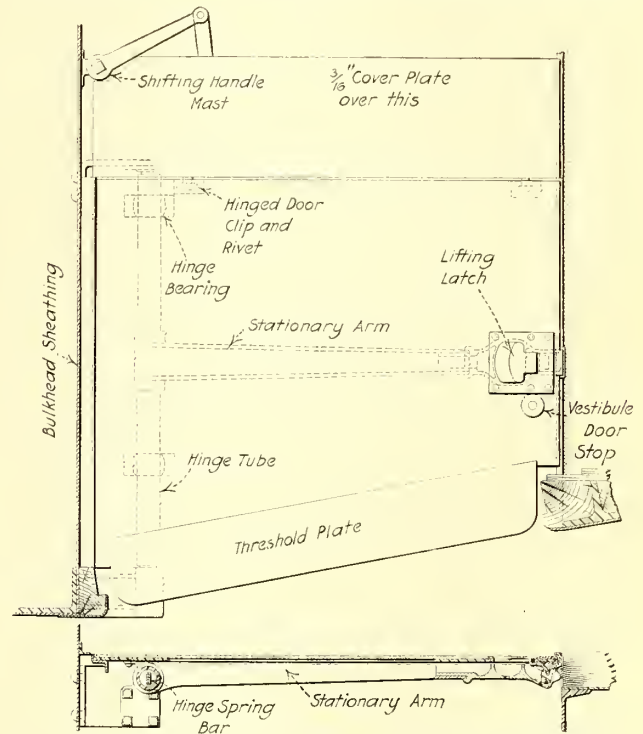

plate. The deck plate to which the letterboard is riveted is continuous around the car body and is formed of a 3 1/2-in. x 2 1/2-in. x 1/4-in. angle on the outside of the car and a 2-in. x 1 1/2-in. x 1/4-in. angle on the inside. The roof is covered with 9/16-in. narrow tongued-and-grooved poplar nailed to wooden strips that are bolted to the steel ceiling carlines, and the head-lining is No. 16 gage sheet steel.

OTHER DETAILS

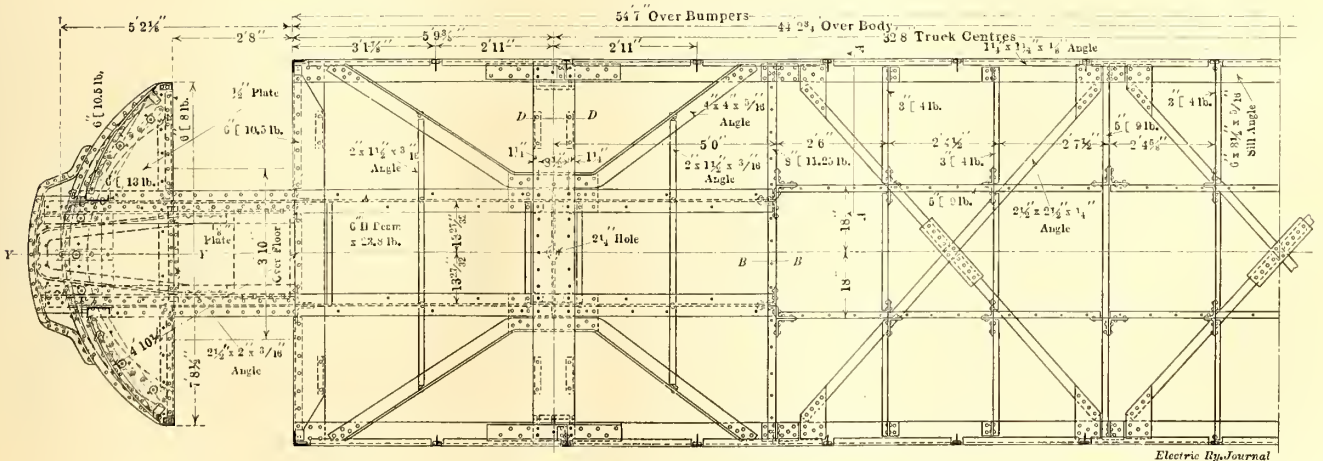

Framing connections are so arranged that no steel member is exposed both to the exterior and the interior of the car. This in addition to the 1/4-in. Agasote panels, the mahogany trim below the window stools, and the double yellow-pine flooring with mineral wool closely packed beneath, thoroughly insulates the car body against heat and cold, and serves as well to dampen vibration. Battleship linoleum 1/4-in. thick is cemented to the wooden car-body floors and is laid with as few joints as possible to make it practically waterproof. The mineral-wool insulation beneath the wooden floor is from 2 in. to 3 in. thick and is held in place by a

CHICAGO & MILWAUKEE CAR—UNDERFRAME DETAILS

CHICAGO & MILWAUKEE CAR—INTERIOR OF PASSENGER COMPARTMENT

false floor that is formed by riveting No. 16 gage sheet steel to the underframe.

Seventeen Hale & Kilburn Walkover seats, 38½ in. long, and three non-reversible seats are installed in the main passenger compartment. Four seats of the same type, three non-reversible seats and one bulkhead seat furnish the seating space in the smoking compartment. All seats in the main passenger compartment are upholstered in green plush and those in the smoking compartment in rattan. Other specialties include Hedley anti-climbers, Tomlinson M.C.B. radial couplers, Advance air sanders with Ohio Brass air-sander valves, U. S. Trolley bases, Edwin S. Wood & Company's anti-friction side and center bearings, Curtain Supply Company's Rexall metal rollers, Forsythe brass sash, Ohmer fare registers, Pyrene fire extinguishers, Electric Service Supply Company's illuminated signs, luminous arc headlights, Peter Smith hot-water heaters, Monarch weatherstripping on the doors, Stanwood three-tread steel car steps, West's deodorizer, pressed prism glass, B. F. Goodrich corrugated rubber mats, Safety Car Heating & Lighting Company's fixtures, Consolidated Car Heating Company's buzzer system, A. & W. Company's ticket holders, and Ackley hand brakes. In painting the car the Detroit Graphite Company's primer was used and the Chicago Varnish Company's method of applying exterior car finish was adopted.

The bodies are mounted on Brill M. C. B.-type trucks

with Midvale rolled-steel wheels and Carnegie heat-treated axles of the Association standard. Westinghouse 557-A-5 tap-field motors insulated for 1200 volts and rated at 140 hp. with 600 volts, 198 amp. and 840 r.p.m. were also specified, the equipment including Westinghouse HLS unit-switch control. The General Electric Company furnished combined automatic and straight air-brake equipment, which is of the variable release type.

SLIDING VESTIBULE TRAPDOORS

An item of exceptional interest in the equipment is the previously-mentioned extensible folding trapdoor over the vestibule steps. This permits the use of the cars on routes where stops are made both at crossroads and at stations with raised platforms having variable clearances. By extending the trapdoors when at a station with raised platforms, there is eliminated any possibility of accident to passengers because of gaps between the car and the station platform edge, such openings being inevitable if the station is located on a curve or if the car is operating over a foreign line having wider platform clearances than those for which it is designed. Thus an arrangement of extraordinary flexibility is provided which is, nevertheless, obtained in a very simple manner.

The trapdoors, which were furnished by the O. M. Edwards Company of Syracuse, are of a new design that operates normally in much the same manner as the standard Edwards vestibule trapdoor as it folds upward against the bulkhead when unlatched, the movement being made easy by a counterbalancing spring inside of the horizontal hinge tube on which the trapdoor pivots. The cover plate of the trapdoor, however, is supported at the bulkhead side upon two hinge bearings which slide upon the hinge tube. At the end-sill side it merely rests upon a narrow bracket upon which it can easily be moved.

The lifting latch, as shown in the illustration on page 389, is made in two mutually-engaging parts, one of which is attached to the cover plate and the other to the so-called stationary arm. The latter, of course, is attached to the hinge tube and swings upward when the trapdoor is folded up against the bulkhead but it does not slide horizontally and is not attached to the cover plate except through the interlocking of the two parts of the latch. In consequence, when the cover plate is slid outward the two parts of the latch are separated and disengaged, and the latch as a whole becomes inop-

CHICAGO & MILWAUKEE CAR—VIEW SHOWING EXTENSIBLE TRAPDOOR IN VARIOUS POSITIONS

erative, the stationary arm being held in place by that part of the latch which is attached to it. The trapdoor, therefore, cannot be unlatched when it is in extended position.

Power for extending the trapdoor is applied through a mast with a folding handle which is placed close to the bulkhead on either side of the vestibule. An arm on this mast below the vestibule floor level is linked to a sliding plate to which the trapdoor is attached by clips and rivet-shaped catches. These clips and catches engage, of course, when the trapdoor is horizontal and this permits the trapdoor to be moved, although it has no permanent connection with the mast arm. The vestibule door, when it is in any but wide-open position, naturally prevents the trapdoor from being raised and this automatically provides a safety feature for the operation. Another feature is the introduction of a vestibule door stop, which is a small button of rubber set in the trapdoor cover plate in such a position that when the trapdoor is wholly or partly extended it interferes with the movement of the vestibule door. The latter, therefore, cannot be fully opened or fully closed if the trapdoor is partly extended, so that it is impossible for the trainman to close the vestibule door inadvertently and let the train proceed with the trapdoor projecting beyond the side of the car.

Power Economy Expert Obtains Results

Several months ago the Elevated Railroads of Chicago detailed an employee of the electrical department to investigate and make recommendations for reducing energy consumption. This company now purchases all its power from the Commonwealth Edison Company and any saving in energy could be measured in dollars and cents in the annual power bill. Numerous economies have been effected in the operation of cars, special attention at first being directed to regulating closely the use of the lights and electric heaters. During the summer months, however, this expert has devoted his attention to schooling motormen in the art of coasting and handling their controllers, and a decrease in the energy consumed is easily traceable to his efforts. An inquiry from the trainmen regarding the actual results or savings obtained by reason of the increased coasting brought out the following table from the management:

KILOWATT-HOURS PER CAR-MILE			Decrease in Per Cent
	June, 1915	June, 1914	
Metropolitan	3.127	3.186	2
Northwestern	2.522	2.625	4
South Side	2.621	2.757	5
Oak Park	3.083	3.013	*2
Loop	3.407	3.726	10
Total	2.823	2.930	3

*Increase.

These cars averaged 25 tons each, the weights of the cars on the several divisions being as follows: Metropolitan, 24.55 tons; Northwestern, 25.95 tons; South Side, 25.95 tons; Oak Park, 22.80 tons; Loop, 25 tons. The tonnages given include average loads.

In explanation of the table it should be stated that the month of June was taken for the comparison because no electric heaters were in operation. This put the comparisons on the basis of the energy consumed by the motors and lights. The increase in energy consumed by the Oak Park line was because more motors were operated per train in June, 1915, than in June, 1914. The company is entirely satisfied with the results being obtained, and a steady improvement in the amount of energy consumed per car-mile is being noted from month to month. The larger amount of energy used by the Metropolitan-Oak Park lines over that con-

sumed by the Northwestern-South Side lines is due to the relatively heavy local service with more stops on the first two roads.

Berlin Street Car Accident

Five people were killed and eight injured on April 22 when a street car of the Berlin (Germany) Stadtring line jumped the rails at a sharp curve near the Reichstag building and plunged over an embankment into the Spree River, 8 ft. deep at that place. Whereas the allowable speed limit in that particular locality was only 12½ m.p.h. the motorman approached the curve at the rate of 15 m.p.h. As the track was slippery from rain he failed to apply the brakes at the right moment and the car jumped the track. The motorman and con-

BERLIN STREET CAR ACCIDENT—RECOVERY OF CAR FROM RIVER

ductor were able to jump from their platforms at the last moment, but unfortunately some of the passengers were imprisoned in the car and drowned.

A wrecking tug was chartered by the railway company to lift the car out of the river into a lighter. All parts joining truck to car body were disconnected and the truck was lifted separately. The upper figure shows the lifting of the car body into the lighter. At the moment in which the car was nearing the bottom of the lighter the cable slipped and the car body was badly crushed, as shown in the lower illustration.

Power house employees of the Louisville (Ky.) Railway appoint safety-first inspection committees each month, whose duty it is to visit each of the stations and substations during that period and inspect them for "accident opportunities" and for dangerous conditions which may be eliminated.

Seven Per Cent Wage Reduction Granted

British Columbia Electric Railway, Ltd., Receives Favorable Majority Report in Case Before Arbitration Board—
Arbitrators' Comments on Company's Contentions Are Published

The arbitration board considering the dispute between the British Columbia Electric Railway, Ltd., Vancouver, B. C., and its employees on Aug. 25 presented a majority report favoring an all-around reduction of wages by about 7 per cent on the average. This was in answer to the company's contention before the board that the wage scale should be decreased 15 per cent. When the agreement between the union and the company expired on June 30 the company notified the men through the general manager that it desired to make a 10 per cent cut in wages throughout. This proposal was rejected by the union, and the company found it necessary to apply to the government for an arbitration board under the industrial disputes investigation act.

This act, which merits a few words of description because of its unusual character, provides that in the case of any dispute an application may be made by either employer or employees to the Minister of Labor for the appointment of a board of conciliation and investigation. This application must be accompanied by a statutory declaration, that failing of an adjustment by the board, to the best of the knowledge and belief of the declarant a strike or lockout will be declared. Under heavy penalties the employer is forbidden to declare or cause a lockout and any employee to go on strike prior to or during the reference of the dispute to the board. One of the members of the board must be recommended within a certain time by each party to the dispute or else be appointed by the Minister of Labor. The two members must agree on a third or he will be appointed by the minister. The decision rendered by the board is only a recommendation to the parties. Nothing in the act restrains lockouts or strikes in disputes which have been duly referred to the board and decided.

The arbitration board chosen in the present British Columbia Electric Railway case was composed of Justice McDonald, chairman, appointed by the Dominion Government; A. G. McCandless, representing the company, and J. H. McVety, representing the employees. Public hearings were opened on July 19 and continued from time to time until Aug. 13. At these hearings W. G. Murrin, general superintendent, and W. Saville, chief clerk, represented the company, and F. A. Hoover and W. Yates appeared for the employees.

POSITION OF BOTH SIDES

At the hearings the company sought a reduction of 15 per cent in the wage scale, basing its arguments on the following grounds: (1) The general business depression existing throughout the company's territory had led to an almost universal reduction of wages. (2) The financial position of the company, owing to decreased business, made it unable to continue the old wage rate. (3) If the rate of wage was determined by the cost of living, such cost had decreased since the last wage agreement was signed in 1913. (4) The wages paid by the company were, in general, higher than those paid by other street railways. (5) The wages paid had advanced 8 per cent since 1913 because of the sliding scale, this increase coming in the face of decreased business. The company also in a general way submitted that the rate of wage should depend upon the supply of and demand for labor. Representatives of the employees

asserted that the wage scale which had prevailed could not be designated as a living wage, and that through the time of prosperity the wages should have been higher.

SUPPLY AND DEMAND

In discussing the question of the supply of and demand for labor, the board stated in its report that in general wages are dependent upon the universal law of supply and demand, but this has only a limited application to the employees of this company. It might be true that there is an over-supply of labor outside the employees' association that might be utilized for the operations of the company, but the company proposes to agree for its labor supply not with workmen generally, but with a particular union or association as representing the employees necessary for its purpose. Under these circumstances the question of supply and demand to a great extent loses its force in determining the rate of wages.

BUSINESS DEPRESSION

In the board's opinion, there is no doubt that a business depression has existed in the company's territory and may continue for some considerable time. The labor market has become congested and has resulted in reduction of wages generally. Wages in mercantile and industrial establishments have been reduced from 10 to 25 per cent. The City Council of Vancouver recently lowered the standard rate of wage 25 per cent, viz., from \$3 to \$2.25. In work on the new drill hall in Vancouver the previously stipulated carpenters' wages were reduced from \$4.25 to \$3.60; painters' from \$4.50 to \$3.60; plumbers' from \$5 to \$4.50; laborers from \$3 to \$2.40.

PRESENT COST OF LIVING

As to the present cost of living, as compared with 1913, it appears from statements based on information in the *Labor Gazette*, that with respect to a typical family of five, the cost of living in Vancouver, including all foods, fuel, light and rent, per week, in the month of March, 1913, was \$16.28 $\frac{1}{4}$, and that it fell to \$13.22 $\frac{1}{4}$ in March, 1915. It also appears that this later cost was lower than in the cities of Calgary, Edmonton, Regina, Winnipeg and Toronto.

A further investigation to cover different months and different cities showed that for this typical family, during January, March and May, the cost per week in 1913 for Vancouver was \$16.48 $\frac{3}{4}$ as compared with \$13.46 $\frac{3}{4}$ in 1915; in Victoria it was \$17.87 $\frac{1}{4}$ in 1913 as compared with \$14.31 $\frac{3}{4}$ in 1915; while in New Westminster it was \$16.89 $\frac{3}{4}$ in 1913 as compared with \$14.56 $\frac{1}{4}$ in 1915, thus showing decreases in each of these cities. A statement was also made of the compounded averages, according to the number of the company's employees in the respective cities, and this showed a decrease in cost between these two periods of 18.92 per cent for Vancouver, 19.89 per cent for Victoria and 13.80 per cent for New Westminster, or making a compounded average decrease for all the cities of 18.17 per cent.

As a result of these investigations the board was satisfied that as between 1913, when the wage scale was last fixed, and the present time, the cost of living had on the whole slightly decreased in the community affected by the inquiry. This result was brought about

by the fact that while the cost of foodstuffs has risen to some extent, this was offset by a considerable reduction in rent and an appreciable decrease in the cost of fuel. The cost of cotton goods has fallen, and the present retail cost of woollen goods is less than it was two years ago, although the opinion of merchants is that in the near future the cost to the consumer of all woollen goods is bound to increase.

COMPARATIVE WAGE SCALES

The company contended that its employees were receiving a higher rate of wages than was paid by any other company carrying on a like business under similar conditions. It stated that, with reference to motormen and conductors, among more than 1000 street railways only a small number could be found paying a higher rate of wages, and that these exceptions could in most cases be accounted for by peculiar local conditions. This statement was found to be substantially proved. A statement filed showing the maximum rate paid in some of the cities gave the following information: Peterborough, 20 cents per hour; Hull, 23 cents; Hamilton, 25 cents; Montreal, 25 cents; Ottawa, 27 cents; Toronto, 27½ cents, as compared with the existing rate paid by the British Columbia Electric Railway of 35 cents in the cities and 36½ cents per hour on the inter-urban lines.

In the neighboring coast cities in the United States the length of service, in order to reach the maximum rate of pay, is greater in most cases than in British Columbia. The rates supplied were as follows: Tacoma, 21 cents per hour; Stockton, 27½ cents; Everett, 28 cents; Los Angeles, 30 cents; San Francisco, 33 cents; San Francisco (municipal), 37½ cents, and Oakland, 40 cents per hour. The board had no evidence showing the different agreements with their employees under which the railways in these cities were operated, nor whether the employees had the benefit of privileges and concessions as liberal as those granted by the British Columbia Electric Railway. The nearest city to which it felt it might look for comparison was Seattle. There, however, the 32 cents maximum rate is only reached after six years' service. From the evidence the board was satisfied that on the whole there was no appreciable difference in the cost of living between the two cities. The climatic and general conditions of operation would be practically the same for the employees, but those working for the company in British Columbia have not only the benefit of an agreement guaranteeing permanent employment with reasonable working conditions, but also receive valuable concessions in the form of half rates for electric lighting, reduced charges for gas, free installation of meters, and free transportation for themselves at all times, and also for their families to a limited extent.

WAGES INCREASED SINCE 1913

In regard to the company's assertion that the rate of wages paid its employees, especially motormen and conductors, had risen 8 per cent since 1913, the board states that this was due to the sliding scale by which length of service entitled an employee to a higher rate of wages. The board did not think that this increase should be considered as an argument for lower wages now. The point, however, might be worthy of consideration to this extent—the employees were presumably satisfied to work for the company in 1913 at the then existing rate of wages and cost of living, and it would not now be unjust under the changed conditions to have them revert to the rate of wages then being paid. In other words, if the rate of wages to motormen and conductors were decreased by 8 per cent, they would, in

these times of depression, receive the same wages as in the period of prosperity.

COMPANY'S FINANCIAL POSITION

The company presented statements in detail showing its financial position and inability to pay the present rate of wages. An extract shows that while the net profit for May, 1914, was \$162,674, it had fallen to \$23,745 in May of 1915, and other amounts showed a corresponding decrease. The whole capital investment in all undertakings of the company, on June 30, 1914, amounted to \$45,935,669, and the net profit for the year was \$2,156,585, giving a net profit of 4.69 per cent on the capital invested, while with the same amount invested the net profit up to June 30, 1915, was \$1,273,603, representing only 2.67 per cent profit.

The proportion of the gross earnings absorbed by wages of motormen and conductors increased from 1913 to 1915. For example, the earnings in the city of Vancouver in June, 1914, were \$161,589 and the wages to motormen and conductors amounted to \$48,402, being 29.95 per cent of the gross earnings, while in June, 1915, the gross earnings were \$84,023 and the wages of motormen and conductors were \$41,488, being 49.37 per cent of the gross earnings. The entire system for the same period did not show disproportion to the same extent, viz., in June, 1913, the gross earnings were \$315,205, and the wages of motormen and conductors were \$81,638, being 25.89 per cent, while in June, 1915, the gross earnings were \$186,586 and the wages were \$71,707, being 38.43 per cent of the gross earnings.

On the subject of the financial standing of the company the board concluded that it should not be a governing or controlling factor in its recommendation as to the rate of wages. Whatever course a company might see fit to pursue of its own accord, the board did not think it should recommend that the company carry on its operations by paying its employees less than a fair wage, based on proper conditions. The arbitrators believed it well, however, to outline the financial condition to show that the company is not in a position to deal liberally with its employees. The presentation of the financial position of the company was also deemed important as a strong argument in favor of using extreme care in making recommendations.

WORKING CONDITIONS

With regard to the change in working conditions asked by the company, the majority report states that in view of the fact that the board which dealt with the dispute between the company and its employees two years ago, did not deem any change necessary; and also in view of the fact that the representatives of the men and the company had agreed upon a majority of the working conditions against which objections were raised, the board thought it advisable not to interfere with this phase of the dispute.

RECOMMENDATIONS

The majority of the board felt satisfied in recommending the adoption by the parties interested of an agreement containing reductions in the wage schedule. In the working conditions, the seniority clause was left intact. This protection, when coupled with efficiency, was believed to create permanency of employment, more especially to those who, by length of service, had secured to themselves an advantageous position under this privilege. In fixing the rates of wages the board did not attempt to capitalize in dollars and cents the concessions enjoyed by the company's employees, but did not overlook their consideration. In making the recommendations the board bore in mind the permanency of employ-

ment that will be guaranteed to the employees by the execution of an agreement covering a definite period. The board recommended that the agreement should expire on June 30, 1917, twenty-two months from Sept. 1, 1915.

Reduction in the case of conductors and motormen was of a little more than 8 per cent. The suggested agreement provides that rates of wages on city and suburban lines for motormen and conductors be, for the first year, 26 cents per hour, rising gradually to 32 cents per hour after four years' service. The rate under the old agreement was 27 cents for the first year, rising gradually to 35 cents per hour after four years' service. A clause in the agreement stating that motormen and conductors on work train service shall receive $1\frac{1}{2}$ cents additional is the same as prevails under the old agreement. The rate of wage for motormen and conductors on the interurban lines, i.e., Central Park, Burnaby Lake and Saanich, it is suggested be reduced to the same extent as conductors and motormen on city lines, the maximum wage on the interurban lines being $33\frac{1}{2}$ cents per hour. For brakemen, trolleyman and baggagemen the rate recommended is 25 cents per hour for the first six months, 26 cents per hour for the second six months, $26\frac{1}{2}$ cents per hour for the second year, $27\frac{1}{2}$ cents per hour for the third year, and $28\frac{1}{2}$ cents per hour for the fourth year and after. The recommendations also cover reductions in the wages of shop and carhouse employees.

The Small Car versus the Large Car

BY D. C. HERSHBERGER, WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

The advent of the jitney into the transportation field has caused serious investigation which already is bringing with it development and invention to meet the competition of this new system of selling transportation. It is somewhat doubtful if this form of competition will be long lived, so that it need not be taken very seriously. However, we are about to return to a small, but efficient car as a means of meeting this competition.

In returning to the small car we would appear to be retrogressing, but upon investigation it will be found that this is an illusion. The small car of to-day will have a greater weight efficiency as regards seating capacity than has been obtained heretofore. It will also

be designed for more economical operation both as to crew expense and power cost.

We naturally question the riding qualities of the small car as compared with that of the large car, but judging from the automobile it would seem reasonable that the riding qualities of the large car in city service could be approached very closely. In the small and medium-sized cities the small car will prove most adaptable in supplying frequency of service, thereby offering more opportunity to ride, especially in the short-haul service, which obviously is the most profitable.

There are some unfavorable features to be overcome in the operation of small cars, one of which is reduced schedule speed with the one-man type car, especially in rush-hour service, because more time is required to collect fares and issue transfers than with two men per car. This objectionable feature can be checkmated to a large extent by employing the skip-stop feature in the outlying districts where permissible and by equipping the cars with adaptable fare collecting apparatus. In the small number of places where it is absolutely necessary to maintain high schedule speeds, the cars could be operated during rush hours by a motorman and conductor. With a greater number of cars handling the same service the number of stops per mile will decrease slightly, which permits a higher schedule speed.

Assuming that the one-man car requires four seconds longer per stop than the two-man car, and that by reason of more cars and fewer passengers per car, the average number of stops per mile would be reduced from eight to seven, approximately the same schedule speed could be maintained. This statement will serve partially to give an idea of the effect of the number of stops and duration of stops on schedule speed.

The accompanying performance curve was made up to show graphically the relative power consumption in city service for (a) a 24-ton car equipped with four 40-hp. motors, (b) an 18-ton car with a double 40-hp. motor equipment, and (c) an 8-ton car with a double 15-hp. motor equipment operating at the same schedule speed. It will be noted that the 24-ton car is over-motored—a condition common to many cities and towns. It would be possible to make a slightly higher schedule speed with the four-motor equipment, which in turn would raise the power consumption considerably.

The accompanying table will give an indication of the relative operating costs of the three weights of cars covered by the above performance curve. The data employed for the basis of this comparison have been taken to represent the average condition throughout the country for medium and small-sized cities.

COMPARATIVE OPERATING DATA FOR LARGE AND SMALL CARS

Weight of car, loaded—tons...	24	18	8
Number of motors per car...	4	2	2
Horsepower per motor at 500 volts	40	40	15
Stops per mile	8	8	8
Average duration of stop—seconds	10	10	10
Kilowatt-hours per car-mile	2.38	1.73	0.76
Kilowatt-hours per car per year at 30,000 car-miles per car	71,400	51,900	22,800
Cost of power per car per year at 1 cent per kilowatt-hour at the car	\$714	\$519	\$228
Assumed seating capacity	45	35	25
Per cent increase in number of cars to carry a given traffic	0	28.7	80
Number of cars required to accommodate the traffic on an assumed property	100	129	180
Yearly power bill	\$71,400	\$66,900	\$41,000
Yearly saving in power bill over four-motor car	0	6.3 per cent	42.6 per cent
Crew-men per car	2	2	1
Average time of each car in service—assumed	12 hours	12 hours	12 hours
Cost of crew per day at 25 cents per man hour	\$600	\$774	\$540
Cost of crew per year—365 days	\$219,000	\$282,000	\$197,000
Yearly power bill and wages of crews on assumed property	\$290,400	\$349,300	\$238,000
Yearly saving of 8-ton car over 24-ton car	0	0	18 per cent
Yearly saving of 8-ton car over 18-ton car	0	0	32 per cent
			\$111,000

POWER-CONSUMPTION CURVES FOR CARS OF VARIOUS SIZES

It will be observed that the yearly power bill decreases with the weight of the car, even taking into account the increased number of cars to handle the same amount of traffic. Any increase in traffic resulting from the more frequent service offered by the small car can be taken care of at a better load factor.

The crew expense is the greater item of expense as compared with the power bill. The above figures show that the 18-ton car is the most expensive to operate on account of larger yearly crew expense to handle the same traffic. This statement, however, does not apply to the latest type of two-motor cars with large seating capacity and in many cases larger motor equipments than considered here.

These figures show a saving in the yearly power bill of 42½ per cent in favor of the small car as compared with the four-motor car, and 18 per cent in crew expense and power bill combined. Furthermore, it shows a saving of 32 per cent in crew and power cost over the 18-ton two-motor two-man car.

Jitney Bus on the Wane in Memphis, Tenn.

The accompanying graph displays the record of the number of jitney buses in operation on the streets in Memphis, Tenn., since the beginning of the movement and until July. This record was inaugurated by T. H. Tutwiler, president Memphis Street Railway Company, and it shows that the general tendency of the jitney bus movement has been a steadily declining one after the first few weeks of its operation. The upper one

RECORD OF JITNEY BUS OPERATION IN MEMPHIS

of the two curves displays the number of jitneys in service during the afternoon rush hour only or from 4.30 p. m. to 6.30 p. m. The lower curve shows the average number of individual jitneys per hour from 7 a. m. to 6 p. m.

It will be noted that there is a sharp break in both curves in the latter part of April, at which time there was made effective a requirement for a \$5,000 bond for jitney buses in accordance with a State law. Within two weeks, however, the number of jitneys in operation increased enough to recover a large part of the loss, but thereafter, during the months of May and June, the downward tendency again was manifest, so that during the latter month the daily average of all-day jitneys was only ninety. During the latter part of

June the \$5,000 bond requirement was declared unconstitutional, and the immediate result was that the number of jitneys increased to a point approximately equal to that established in the early part of May, but by no means equal to the record of the early part of April, before the statute went into effect. During the month of July, which is not included in the graph, the high point was 190 for the rush-hour jitneys and 133 for the all-day operators, both maximums being reached on July 2. Thereafter the number of cars again fell off steadily, reaching minimums of 160 and 105 respectively at the end of the month.

In Memphis the types of jitney buses have been about equally divided between Fords and other miscellaneous types of cars, seating five passengers. There have been also about twenty seven-passenger cars, and during the past two months, about ten buses with seating capacities between nine and fourteen.

Traffic Count in Manila

The Board of Public Utility Commissioners at Manila recently made a count of the passengers on the electric railway system there to determine whether the service given the rush hours was adequate. The count was taken during the six week-days of the week from May 21 to May 27. The accompanying tabulation of the data obtained was made by the Manila Electric Railroad & Light Company. These data, particularly the percentage figures in the last three columns, are interesting as bearing out the company's contention, made at the commission hearing and in its brief, that it was not responsible for the so-called inadequacy of service or overcrowding of cars, as long as reasonably adequate service was furnished. The alleged overcrowding was caused by the manner in which the public used the service in crowding certain cars. There was no occasion to do so, provided the passengers would distribute themselves more equitably over a reasonable number of cars and not congest a few cars during the rush hours.

The situation in Manila is complicated somewhat because the company must furnish facilities for both first and second class passengers on each car. The franchise of the company provides that "at least 60 per cent of the accommodation furnished will be second class." The figures show that approximately 15 per cent of the total passengers carried are first class passengers and approximately 85 per cent are second class passengers. In practice, the company requires its conductors to reserve for first class passengers such portion of the car as experience has shown should be reasonably adequate, preserving at least 60 per cent of the capacity of the car for second class passengers. The first class section of the car is separated from the second class section by means of a movable barrier. Conductors are required to set this barrier in position before the car starts on its journey from its terminal, and are not permitted to shift it to increase the space allotted for first class passengers unless there are unoccupied seats in the second class section of the car. In practice, about 80 per cent of the capacity of the car is reserved for second class passengers and 20 per cent for first class.

TABLE SHOWING RESULT OF TRAFFIC COUNT IN MANILA THREE PRINCIPAL LINES DURING RUSH HOURS, MAY 21-27, 1915.

Way Department Report Forms

The Forms Were Designed for the Purposes of a Small Road with Particular Reference to Their Disciplinary and Record Value

The report forms which are used by the employees of the way department of the Chicago, Ottawa & Peoria Railway, Joliet, Ill., were designed with two objects in view. One was that they should include all the information desired from a record standpoint. The other was for their disciplinary value. It was found that when reports were required in the form of letters or brief memoranda, many of them did not contain all the information desired and, as the arrangement of the data in the letters varied, the information was difficult to check. Furthermore, there was a tendency on the part of the man who simply wrote a letter report to omit information which would seem to criticise a fellow workman. But with a printed report form the employees feel that they are in duty bound to answer the questions on the forms to the best of their ability, no matter where "the chips may fall." Another reason why the men prefer to submit their reports on forms is that the questions reduce the effort required to prepare a report by suggesting the subjects to be covered as well as by reducing the amount of information which must be recorded.

Probably the most striking example of the type of form employed to obtain both disciplinary value and financial return is that used in reporting the results of an insurance inspection of premises (Form 1). This report is compiled once each month by the substation repair foreman, whose duties include the inspection of all structures for insurance purposes. At this time the person in charge of the building is directed to eliminate

fire hazards and not to take any extraordinary risks during the period between inspections. On his rounds the regular inspector examines all fire extinguishers, which, prior to the time of adopting this method, were occasionally found to be broken or stolen or cast into a hidden corner when empty. In a similar manner sand and water pails are inspected and the condition of fire hose and hydrants is determined. As a result of this monthly fire inspection the men in charge of buildings have begun to have pride in the condition of their premises, the fire-fighting equipment is kept in good condition, and fire risks are not taken. In connection with this report form the company has been enabled to reduce its insurance rate from \$1.41 per thousand to 73 cents, by removing fire hazards and by providing certain fire protective apparatus.

Other forms designed to have disciplinary value as well as record interruptions to service are reports on accidents or damage to overhead lines and equipment, the line and signal maintainers' daily report and the dispatcher's line trouble record. The accident report (Form 2) is made out by the overhead line foreman and forwarded to the office of the engineer of maintenance of way, being a record of damage. Form 3, the dispatcher's report form, is designed to furnish a record of service interruptions, and at the same time it may be checked against reports of the line and signal department for discrepancies.

The work-train report (Form 5) also accomplishes the same end and in many instances has brought about

WAY REPORTS—FORM 3—DISPATCHER'S REPORT AND MAINTAINERS' TELEPHONE REPORT

real financial saving to the company. As a rule the operation of the work-train on an electric road is regarded by the transportation department as a favor to the way department, and as it is considered that the train has no rights of any kind, it therefore should be subject to any number and length of delays. With this company it was found that if the work-train received certain limited rights and had the benefit of extra time because of delayed trains or other reasons, the way department could accomplish more work for considerably less money and at the same time reduce the cost of work-train service to the department.

Perhaps the section foreman's daily report (Form 4) presents the most effective method of reducing the clerical work of the foreman, at the same time giving a legible record to the maintenance of way department. This report is printed on manila cardboard and on one side are the name of the railway company, the letters R. R. B. and blanks for the address. The reproduction of the report form shows that the writing which the section foreman must do includes the insertion of the date and his name. All of the entries regarding the amount of work done and the hours required to do the work may be made in figures. This reduces the work to routine and minimizes the time required to make a report.

Two other report forms which are not in general use but have proved of value are outlines of the labor performed and materials used by the overhead and the bridge and building departments. While it is general practice to require a report from the bridge and building department foreman, this company has gone one step further in setting down in printed form an outline of all the kinds of labor performed and materials used by this department (Form 6). This form also reduces the work of the foreman largely to recording figures rather than writing and thereby provides a much neater report to be filed away for record purposes. The same might be said of the overhead line daily report (Form 7), which is not in general use on electric roads. Both of these forms also have a disciplinary value in that they obtain a record of work performed, against which a check may be made at any time and the foreman disciplined for inaccuracies.

Similarly the daily report form for signal and crossing-bell operation (Form 8) was designed to minimize the clerical work and at the same time to be so comprehensive in character as to cover all the work which might be done by an employee of that department. Since this company has only 16 miles of block-signalized territory, with crossing bells scattered over the entire

106 miles of line, only one maintainer is necessary. In order to handle the line, only work to best advantage he moves over the road on a predetermined schedule unless he is called away on special emergency trouble. To provide for the two classes of work, the upper portion of his report form is for emergency work and the lower for routine. This report form is also used by the transportation department, as well as by the signal maintainer, one being checked against the other; hence, it has a disciplinary value in the way of obtaining correct reports like the other forms used by this company.

In order to obtain a cost record of the material used and the labor performed in construction work or of money expended and charged to capital account, the bridge and building department is required to make a structural report.

A copy of one of these reports is reproduced in Form 9. From this it will be seen that a complete record of every item of lumber used, as well as of all labor and haulage, is recorded. This being merely the actual cost of work done, to which engineering, superintendence as well as overhead may be added, makes it possible to obtain an accurate charge against any account.

Kind of Labor: Carpenter 31 27 1/2 per hr 8.52

Other Charges: Drayage on lumber 75¢ .75

The above statement is correct. *H. L. Lynn* Foreman, B. & B.

WAY REPORTS—FORM 9—STRUCTURAL REPORT

important to minimize the force required to accomplish the work. A single storekeeper performs all the duties required in this department, but to permit him to keep up his records, the storeroom is open only during certain hours. Except in emergencies, the various departments must anticipate their needs and secure material when the storeroom is open. To simplify the work the company has adopted the bin-tag method of keeping a temporary count of the stock on hand, with very satisfactory results. These tags (Form 10) are printed on a heavy

WAY REPORTS—FORM 10—BIN TAG

manila cardboard, 4 in. x 7 1/2 in. in size, one card being hung on a hook provided on the front of each bin. Each tag gives a history of the contents of the bin to which it is attached and also a record which may be transferred to the stock ledger from time to time as the storekeeper is able to devote time to its transfer. From time to time material is purchased for special jobs and held in the storeroom. To designate which bins contain this special material red bin tags are used in the place of the manila ones. When a requisition is made for material contained in one of the bins marked with a red tag, it must state specifically that the material is to be used on the job number for which it was

ordered. This insures correct distribution of the charges as well as a sufficient quantity on hand for a particular job when it is needed.

South Bend Collects Jitney Data

During the month of July the Chicago, South Bend & Northern Indiana Railway, South Bend, Ind., collected sufficient jitney traffic data to make a graphical study of their operation. The result of this graphical analysis is shown in the accompanying diagram. It shows the total number of jitneys operated during the various days of the period and the total number of different machines in the jitney service during the month. In addition a careful record was kept of the temperatures and the weather conditions. It was found that in South Bend the peak of the jitney service always occurred on Saturday, and that the peak increased from thirty-one jitney buses on the first Saturday of the month to 120 on the last Saturday of the month. It is also interesting to note that as a rule the low points in the jitney bus service are on the rainy days. It will also be noted that during the month of July the total number of dif-

GRAPHICAL STUDY OF SOUTH BEND JITNEYS DURING JULY

ferent machines operated increased from twelve to 204. Many of these, however, were only operated one day, and others ran only on Saturdays.

It will also be seen that the total number of automobiles operated has increased much faster than the rise in the peak of jitney service offered. In other words, many drivers were disappointed with their earnings and after operating a few days decided that they were in an unprofitable business.

The railway company intends to continue the collection of jitney data and will make a more complete analysis showing the number of jitneys in service during the various periods of the day. The management expects to find that the maximum number of jitneys will be operated at about 6 o'clock in the evening and the minimum number in the early morning hours.

The Tramway & Railway World states that the Germans in their search for various metals have taken away the overhead tramway wires and telegraph wires in a number of the Belgian and French towns and districts which they have devastated.

COMMUNICATIONS

Operating Costs and Shifts in Service

AMERICAN ELECTRIC RAILWAY ASSOCIATION
BUREAU OF FARE RESEARCH

NEW YORK, N. Y., Aug. 27, 1915.

To the Editors:

Some question may be raised as to the validity of comparing costs of operation with an index number determined by adding together twenty-four differences in percentages, as was done in my article on "Operating Costs and Shifts in Service" appearing in the issue of the *ELECTRIC RAILWAY JOURNAL* for Aug. 21. It may therefore be of interest to indicate here somewhat more fully than was done in that article the steps which preceded that comparison, and their significance.

In making a study of the effect of changes in distribution of service throughout the day, a number of cases were assumed, and it was found that the unit cost

DIAGRAM OF TIME DISTRIBUTION OF CAR-HOURS

of operation, that is to say, the total cost per day divided by the number of car-hours per day, showed a considerable variation. An effort was made to relate these costs to the various load diagrams.

A load diagram, is, in itself, a rather difficult thing to express in units of any sort, but as the differences between the diagrams assumed lay in the extent of the concentration of the service within certain periods, resort was had to a well-known statistical method of measuring concentration. This consists in representing graphically such data as were given in the table on page 307 of the issue for Aug. 21, as in the accompanying illustration. Here per cent of total car-hours is plotted against per cent of total time for uniform and non-uniform service. The principle is the same as that employed in statistical studies of the concentration of wealth, in the "Lorenz graph," which is readily adapted to the purpose of indicating and measuring concentration of service.

In the diagram the straight diagonal line represents uniformity of distribution, or no concentration. The curved line drawn between the same points as the diagonal line shows the actual distribution of service as determined from an assumed load diagram. The area between these two lines is a measure of the departure from uniformity of the variable, in this case per cent of car-hours, and may be termed the index of concentration. It graphically represents the sum of the per

cent differences in car-hours as given in the table, and enables one to visualize this difference.

The conclusions from this analysis are simply that the cost per car-hour is not fixed for any property but tends to increase with increased concentration of service. The concentration index is not a pure functional unit of cost, but it serves the purpose of affording a concrete conception of a complicated array of facts.

F. W. DOOLITTLE, Director.

Girder and High T-Rail Renewals

THE TOLEDO & WESTERN RAILROAD COMPANY
SYLVANIA, OHIO, Aug. 14, 1915.

To the Editors:

I note on page 179 of your July 31 issue certain statements regarding the rate of rail wear in paved streets. There are some points with which I agree, but for the sake of discussion I shall give you my views concerning the subject of this article.

While I have had no great amount of rail corrugation, yet I believe that in some cities it should be taken into serious consideration when determining the life of various classes of rail. Corrugation is generally taken care of by grinding down the rail head and this naturally shortens the life of a rail. Therefore the life limits for a certain weight of rail under the same traffic will not be the same in different cities. Engineers in deciding rail life must necessarily bear the idea of corrugation in mind, as I understand that in some cities it amounts to considerable.

I imagine it was the intention of the article mentioned to suggest the establishment of rail wear limits so that, for the sake of valuation purposes, all railroads could work toward the same end and with the same general ideas in mind. I disagree with you that an arbitrary limit would probably never be reached in service, but that the mere fixing of a wear limit would place the economics of rail renewals on a definite basis. I believe engineers should not fix a limit that would not be reached in service, but that this question should be thoroughly threshed out to get the limit as near the actual life as possible. There is no doubt that the question of a proper foundation is a very great item in the life of rail so that I believe there must necessarily be established life limits for both open and paved track work.

I have never thoroughly understood why street railways use the tram rail and girder-groove rail, except, of course, where franchise requirements make it necessary. I believe that if the engineering associations of the country bear on this matter strongly enough such requirements can be overcome. With the restrictions that city governments are constantly placing upon street railways, careful consideration should justifiably be given by the city officers to the life of rail.

As shown in your article both by statements and by the sketches, it is very apparent that as great life cannot be obtained from a tram rail as from a T-rail section. It is my opinion that when wheels begin to ride the tram of a rail, this rail has practically reached its limit. When cars ride on the wheel flanges, naturally there is more danger of derailments, which in a great many cities is a question that comes into play when rail renewals are considered.

A street railway is hardly in the same position as a steam road because it can very seldom take rail for relaying on a street of lighter traffic. Public policy frequently demands that this should not be done. I was once connected with a steam railroad where curves constituted a greater per cent of the track than tangents. The traffic was very heavy and rail wear was correspondingly heavy. I note that the Boston Elevated shows a

40 per cent wear on a 70-lb. section used on a curve. On this particular steam railroad we permitted even greater wear than that, so that the allowable limits of the Boston Elevated are not as great as those permitted on a heavy trunk line. I suppose that the Boston Elevated adopted this limit because, being on elevated structure, it could not safely afford to allow a greater head reduction. By the same token the allowable wear of rail in subways may be something different from that on surface tracks or on an elevated structure. It therefore appears there should be four classes of rail wear considered, namely, open track, paved track, elevated track and subway track.

As stated in the article, grooved rail should have sufficient depth to permit maximum headwear before wheel flanges ride the floor. Where a great many inter-urban cars operate over city tracks and the wheels have deeper flanges than wheels on city cars, it is my opinion that the standard grooved rail will not permit the maximum rail wear to be obtained. The cross-section of girder-groove rail is such as to prove unstable usually before a reasonable life has been obtained from the rail. By this I mean that one hardly obtains the value from the track structure before the grooved rail is worn out. I will admit that tram and girder-groove rail may possibly give a better general condition of paving, but this has been largely overcome by the use of granite nose blocks on the gage side of T-rails.

In my opinion, due consideration has not been given in the past to the character of foundation supporting the track superstructure. If a foundation fails because it has not sufficient strength to carry the superstructure, just that soon does the rail become the part of the structure that takes the brunt of the rolling weight. It is my belief that with a good foundation, T-rail will last at least thirty years. With pavement properly laid around the track superstructure the paving can well be renewed two, three or even four times before any attention need be given to the general surface of the rail. Therefore, I believe that all rail should be laid $\frac{3}{8}$ in. above the top of paving. If the average life of paving is about seven to ten years, it can hardly be possible that rail will be worn down $\frac{3}{8}$ in. in that length of time. As the article states where there is much car traffic, the team traffic is usually correspondingly great, consequently the paving wears down faster.

As an argument with some engineers regarding the different types of construction, it is my opinion, always has been and always will be, that the track must have a certain resiliency to give a maximum wear. The article states that indications are that rail wear is less in ballasted open track construction than in paved streets and a conclusion is drawn that the resilient construction shows less wear than rigid construction. It hardly seems unreasonable that this conclusion was reached. Even though the rate of rail wear was not so great, when the time comes to renew, even when the street grade is not changed, it is necessary to destroy the subfoundation to get to the ties incased in it. This seems an unnecessary waste of money, particularly when a foundation sufficiently strong may be provided in which track structure rests upon a cushion of ballast. This type of foundation makes destruction unnecessary and provides resiliency. The foundation may be used again for the track structure.

The article states "mere sentiment should not govern the final decision" when the paving is to be renewed and it is economical to leave the rail in place. In a great many cases "mere sentiment" is a big factor in preventing adverse criticism from those who reside on the street. Adverse criticism is one thing that neither engineers nor anyone else can readily overcome.

A. SWARTZ, Vice-President.

UNITED RAILWAYS COMPANY OF ST. LOUIS

ST. LOUIS, Mo., Aug. 26, 1915.

To the Editors:

Referring to the article entitled "Girder and High T-Rail Renewals" in the July 31 issue of the *ELECTRIC RAILWAY JOURNAL*, I believe that there are comparatively few cases where the head wear on the longer sections of track is the determining factor in connection with rail renewals.

When the rails become so badly worn that the wheel flanges have cut from $\frac{1}{16}$ in. to $\frac{1}{8}$ in. into the flange-way, the rails generally become loose on account of the improper position of the load upon the head. The resulting vibration under the wheels makes it very difficult to maintain a satisfactory paving along the rails. When the rails are worn to such an extent they are usually corrugated, surface bent or cupped at the joints, or the paving or foundation is in bad condition, so that it is advisable to renew the rail some time before the head-wear limit has been reached.

If it was possible for street railway companies to wear out the rails regardless of the noise or the condition of the pavement along the rails and without damage to the track foundation, by simply keeping the track in safe condition for the operation of cars at a speed of approximately 10 m.p.h., the question would be very much simplified. But with the present public demand for smooth pavements for automobiles and with the ordinary objections to unnecessary noise, it is not often economical to maintain joints, foundation and pavement until the rail head has been entirely worn out. There will, of course, be some pieces of rail in a long section of track where the head wear will exceed 50 per cent, and it will be necessary to renew these rails because the wear limit has been reached. For such work worn rails that are taken from other tracks laid with the same section can be used. Practically all worn rails can be relaid in this manner, or in carhouse tracks, temporary tracks or yards.

While there has been some improvement in joint life due to the use of the newer types of rails and greater care in placing joints, the old adage, "The life of the joint is the life of the rail" will probably continue to hold. Our experience with excessive rail corrosion has been that it is always found in poorly drained, level grade streets.

C. L. HAWKINS,

Engineer Maintenance of Way.

Starting Resistance of Electric Cars

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY

EAST PITTSBURGH, PA., Aug. 28, 1915.

To the Editors:

Referring to recent articles and editorials in the *ELECTRIC RAILWAY JOURNAL* on the above subject, further consideration may be of some value.

Train resistance depends upon so many variables that it is always more or less an uncertain quantity so far as calculations are concerned. Fortunately, however, in determining energy consumption and motor heating, a number of existing formulas and curves give satisfactory results. In most cases of electric operation, the amount of work done by an equipment in overcoming train resistance is a very small part of the entire duty on the equipment, and the excessive resistance found at the instant of starting lasts for such a short time that the effect on energy consumption and heating is exceedingly small.

In calculating performance from motor curves and train resistance curves it is customary to assume that, from the instant of starting until full voltage is applied to the motors, the train resistance is constant at the value which obtains at the speed corresponding to full

voltage and accelerating current. This practice makes some compensation for neglecting the high initial starting resistance and, by the results of tests compared with calculations, has been proved satisfactory in determining equipment performance and making equipment selections.

The energy consumed by a car depends to a very great extent upon the way in which the motorman handles the car. By improper acceleration and braking, the motorman can easily waste several times as much energy as is required for the sole purpose of overcoming train resistance. Devices used to induce energy saving, such as coasting clocks, depend upon this fact for their effectiveness which is secured by promoting correct acceleration and braking.

While the preceding paragraphs indicate that the starting resistance of cars is relatively unimportant in its effect on heating and energy consumption, yet it must be considered in the application and adjustment of the apparatus composing an equipment. On passenger cars with hand-controlled acceleration, in case a start is not made on the first notch, it is, of course, possible to get under way by going to the second or a higher notch on the controller. With automatic equipments, the conditions of voltage variation, track profile and alignment must be considered in determining the setting of the limit switch in order to secure starting under all normal conditions. For emergencies it is sometimes found advisable to provide a limit cut-out which permits progression of the control until a start is secured.

Locomotives, even of the passenger class, employ acceleration rates which are low in comparison with those of single cars or multiple-unit trains. Consequently, high starting resistance is a more serious proposition on locomotives. Practically all electric locomotives are equipped for hand-controlled acceleration and it is essential that their controllers be provided with a sufficient number of steps to permit smaller variations in the torque developed by the motors during acceleration than is usually found on cars. This serves to insure a smooth start even with a stiff train where the starting resistance is abnormal.

The starting of high-speed passenger locomotives does not in general require the full adhesion of the drivers. Therefore, the maximum starting torque for a given weight of passenger train becomes purely a matter of track characteristics, rate of acceleration and train resistance, and the electrical equipment may be adequate without being powerful enough to slip the drivers. On the other hand freight locomotives, in normal starting, are frequently required to work very close to the slipping point of the wheels. Hence, excessive starting resistance appears more important and apparently should be cared for, not only in the capacity of the equipment, but also by providing sufficient weight on drivers. However, to offset this, it is often feasible, in starting an extra heavy or stiff freight train, to get under way by first bunching the slack; then the application of power serves to start the cars successively rather than simultaneously. On this account, it is rarely necessary to consider the high starting resistance in determining the necessary weight on the drivers of a freight locomotive.

The conclusion from the above considerations is that, while the resistance of cars is undoubtedly high in starting and must be kept in mind particularly when considering automatic equipments, yet the instances where it is a determining factor in equipment selection, locomotive weight determination or energy consumption are relatively few.

F. E. WYNNE,

Engineer Railway Section General Engineering Division.

The Ultra-Light-Weight Car

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
EAST PITTSBURGH, PA., Aug. 19, 1915.

To the Editors:

The communication appearing in the *ELECTRIC RAILWAY JOURNAL* for Aug. 7, page 234, on the subject of ultra-light-weight cars is timely and attracts attention to a very important question. All railway men, as a rule, appreciate the great value of caution signals in any form, and I am quite sure that others entertain the same views as the writer of the article referred to.

When the wave toward lighter cars swept over the country several years ago, great reductions in the weight of cars were introduced, and unquestionably durability was sacrificed in some instances although these instances were the exception, not the rule. A timely caution should, therefore, preclude such errors in the design of the ultra-light cars.

Of course, it is always more desirable, from the manufacturer's standpoint, to make haste slowly in the matter of new and untried designs and materials. Nevertheless, while these ultra-light cars, together with the electric equipment, materially reduce selling value and volume of work compared with larger and heavier cars, the manufacturers have shown their readiness, even in dull business times, to co-operate with the railways in developing an electric car that could be operated far more economically than the heavier types and thus would enable the railways at least to attempt a solution for the jitney problem.

Under these circumstances, the writer is of the opinion, owing to the great amount of experience in car and equipment design gathered during the past several years together with the close co-operation that exists between manufacturers and the high-grade, well-seasoned engineering talent now employed by many railway companies, that none of the established car builders or equipment manufacturers will be very apt to put out designs that are not consistently durable.

M. B. LAMBERT, Assistant Manager

Railway and Lighting Department.

Track on Concrete Stringers

RAILWAY TRACKWORK COMPANY

PHILADELPHIA, PA., Aug. 27, 1915.

To the Editors:

I noted with considerable interest the article on page 324 of the Aug. 21 issue of the *ELECTRIC RAILWAY JOURNAL* describing standard paved track construction of the Southern Public Utilities Company as used in Anderson, S. C., also your editorial comments on same. In this editorial you state that the "old style" beam type of track foundation has been abandoned by most street railway companies but that improvements therein may effect its revival. According to Mr. Horton's description, the fundamental requirement to success is recognized. It is an absolute requirement in this type of construction that the rail be held down rigidly upon the concrete beam, and this is the keynote of the whole proposition. If the rail is bolted down to an absolute bearing on the concrete, with provision made for taking up for concrete shrinkage during setting, the beam type of construction is successful, and it is this holding down and taking up for shrinkage that marks the difference between success and failure.

This point was recognized and taken into account more than twelve years ago in the construction of the track system in the city of Philadelphia. Its unqualified success in this city is shown by the following facts.

Subsequently the whole of the downtown business

section of Philadelphia has been constructed according to this plan. On Fourth Street and Germantown Avenue nearly 7000 ft. of track was laid in August, 1903, and has been in continuous service since. No repairs whatever have been made on these streets to date. I mention this line in particular, because it was the earliest line so built. The only repairs made on any of this type of construction in Philadelphia have been due to two causes: first, at the outset, anchoring bolts of too small diameter were used and heavier bolts were substituted; second, a short stretch of track was laid on fresh filling over subway excavations and settlement thereby affected the whole street foundation. The fault developed by the light holding-down bolts proves conclusively our contention as to the need for holding down the rail against the cold-rolling action of the wheels and unequal expansion of the rails and preventing the resultant pulverizing and disintegration of the concrete stringer.

I think I may pardonably point to the Philadelphia system as an example of successful concrete beam track construction, and I may further say that its success has been contingent on the observance of the principle that the rail must be held down rigidly against the concrete base, provision also being made for taking up the shrinkage of the concrete in setting.

It is sometimes stated that the cost of this type of track is excessive, but my experience has shown it to be no more costly than the plan of using wooden ties embedded in concrete, and its great advantage (with respect to cost) over the ties embedded in concrete is that the foundation becomes, in this case, a permanent investment and its cost may be in part written off against capital account; because it has been abundantly demonstrated experimentally that new rails may be laid on the old foundation without substantial disturbance to the latter when the adjustable holding-down bolts are employed.

H. B. NICHOLS.

Outjitting the Jitney

BOSTON, MASS., Aug. 30, 1915.

To the Editors:

The writer has been much interested in the various comments on the jitney which have appeared in your columns, pro and con, chiefly the latter. There seems to be no doubt at all that the swarm of jitneys with irresponsible drivers which has swooped down upon some of our cities with rather disastrous results is going to be considerably thinned out in the future. Nevertheless, it is not altogether clear that, to dignify the thing by its right name, the motor bus, with low fare, is not in the long run going to be a useful addition to means of public transportation. Every street railway man appreciates, when he can forget the sore spots produced by wildcat competition, that there are many places to which, for lack of suitably paying traffic, he would not extend his tracks if he could, and that there are many others to which he cannot gain access on account of the objections of the abutters. Now the jitney, if it succeeds at all, succeeds in virtue of a short haul and if not legislated out of existence is likely to do some very useful feeding for electric railway lines, perhaps in this way, if properly regulated, helping more than it hurts by direct stealing of passengers. Again, there is much territory rich in passengers for two or three months per year and at other times hopeless. In such places a motor-bus line may succeed where an electric railway, by reason of its overhead charges, would inevitably fail. Opposition to such traffic is going to be futile to say nothing of being foolish.

Left to itself with even a moderate amount of sane

regulation the jitney will very soon find its level, abandon much of its direct competition and settle down into doing what may prove to be an extremely useful auxiliary service. And if such is to be the case the electric railways themselves, as custodians of general transportation interests, should go into the jitney game, as they already have successfully in some instances. If the scheme can be made to pay reliably at all it is in working territory which is not directly or at all served by tramways and, in particular, taking advantage of the shifting of traffic from place to place with the seasons or local requirements.

The writer happens to be consulting engineer for a small electric railway, and he has thoroughly made up his mind that if the jitney danger threatens he is going to apply David Harum's golden rule, "Do unto the other fellow as he would do unto you, and do it fust." A watering place not far beyond the end of the line, for example, looks good as a jitney proposition, while it certainly would not pay for all the year round electric service, and the dear city fathers are usually not inclined to permit discontinuing electric cars once they are settled into use. It may be that the bus line will have to be put through by the co-operation of a wicked partner, but it certainly will get busy before the Philistines have a chance to make merry with it.

ENGINEER.

Wants Tramway Catalogs

COMPANIA ELECTRICA DE CONCEPCION
CASILLA 99F,

CONCEPCION, CHILE, July 28, 1915.

To the Editors:

Will you please make a note in your (or perhaps I ought to say our) valuable paper that we shall be in the market for supplies for our tramway concern shortly? I shall be pleased to receive catalogs and lists from manufacturers in the States.

HARRY S. THOMAS, Engineer.

Graphite and Asbestos

Two products of increasing importance, particularly in power plants, are graphite and asbestos. The former is useful in preventing the formation of boiler scale and the latter in pipe coverings, packings, etc.

According to Edson S. Bastin of the United States Geological Survey, the production of natural graphite in 1914 in the United States amounted to 4336 short tons, valued at \$324,118. Of this quantity, 1725 tons were amorphous, valued at \$38,750, and 2611 tons were crystalline, valued at \$285,368. The greater part of the crystalline graphite—all the "flake" variety—was produced in New York, Pennsylvania and Alabama. A small quantity of crystalline graphite was produced in Montana.

The entire output of natural graphite in 1914 showed an increase in value as compared with that of 1913 but a slight decrease in quantity. The lessened production was due to the fact that the output of low-grade amorphous graphite did not reach the figures for 1913. The production of manufactured graphite in 1914 by the International Acheson Graphite Company, of Niagara Falls, was 10,455,139 lb. or 5228 short tons, valued at \$698,800. This is an average price of \$6.68 per ton.

In 1914 the United States produced 1247 tons of asbestos, valued at \$16,810, according to the annual report on the production of asbestos just issued by the United States Geological Survey. Copies of the report are now available for distribution.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Changes in the Convention Program Are Announced—Director McConaughy Gives Further Details Concerning Special Trains—Annual Meeting of Manufacturers' Association—Manila Company Section

CHANGES IN THE PROGRAM FOR THE CONVENTION

The official program of the San Francisco Convention of the American Electric Railway Association and its affiliated associations has now been completed. It will show a few changes from the tentative program published in the last issue of this paper. The principal changes are as follows:

In the Accountants' session on Monday, following the report of the committee on education, there will be an award of a prize of \$50 in gold to the author of the best paper submitted on the eighth lecture in the accountants' course. Following the report on passenger, freight and express accounting, there will be an address on "Electric Railway Accounting, a Review," by P. V. Burington, secretary Columbus Railway, Power & Light Company,

Movement," by J. S. Harrison, claim agent Jacksonville (Fla.) Traction Company.

"Justification of the Safety-First Movement from a Humanitarian Standpoint," by Alves Dixon, claim agent El Paso (Tex.) Railway.

"Uses and Benefits of Illustrated Lectures," by H. K. Bennett, claim agent Fitchburg & Leominster Street Railway, Fitchburg, Mass.

"Should a Moving Picture Film Exchange Be Established by the American Electric Railway Association?" by F. J. Warnock, chief claim agent of the Mahoning & Shenango Railway & Light Company, Youngstown, Ohio.

In the program of the American Association the title of the address to be presented by ex-United States Senator Jonathan Bourne, Jr., has been changed to read "Evils of Government Ownership."

MAIN ASSEMBLY HALL, NATIVE SONS OF THE GOLDEN WEST BUILDING, SAN FRANCISCO

Columbus, Ohio. The title of the paper to be presented by Prof. H. R. Hatfield of the University of California is, "Some Neglected Problems in Electric Railway Accounting." This paper will be presented on Wednesday afternoon. The paper by Prof. Carl C. Plehn, University of California, is on "Taxation of Electric Railways," and will be presented Tuesday afternoon instead of Wednesday afternoon. Two other papers have been added to the program. One of these is on "Value of Statistics to Executives and Accounting Departments," and will be presented on Tuesday afternoon by George C. Willcutt, secretary United Railroads of San Francisco. The other paper is on "The Importance of Accrued and Accruing Accounts from the Standpoint of the Certified Public Accountant," and will be presented by John F. Forbes, C.P.A., representing Haskins & Sells in San Francisco.

In the convention of the Claims Association the paper scheduled to be presented by S. B. Hare on Monday afternoon will have the title "Prevention of Motor-Vehicle Accidents." On Thursday four written discussions are scheduled to follow the presentation of the paper on "Safety and Its Relation to Conservation," by B. F. Boynton. These written discussions are as follows:

"Financial Benefits Resulting from the Safety-First

TRANSPORTATION AND REGISTRATION

H. G. McConaughy, director of transportation, announces that the "Red Special" will be oversubscribed and that the prospects are excellent for a full train out of Chicago for the "White Special." As the special train equipment is limited it is most important that the members who contemplate taking any of the tours notify the director of transportation at once regarding their wishes in the matter. From advance registration and requests for hotel accommodations a large attendance for the convention is assured.

Owing to the many details in connection with reservations on the "Red Special," such as baggage arrangements, printing the train directory, etc., members who have not notified the committee of their intention of joining the party should do so at once. Members who have made reservations on the special trains will receive tags for their baggage as well as all information covering the details in connection with special train movements.

The registration of members and guests will be the same as last year, and all badges must be paid for. Member companies of the Manufacturers' Association must have paid their dues before their representatives can secure badges. Representatives of member companies of the Manufacturers' Association who are individual members must have paid their dues to the American Association and must have received from Secretary Burritt numbered cards as receipts. These are white cards printed in brown ink, with brown corners. Individual members must be representatives of company members of the Manufacturers' Association before they can secure badges. Representatives of manufacturers who have not attended previous conventions will be required to pay \$5 each for badges at the convention registration office.

The Railway and Manufacturers' Associations have contracts with the Palace, Fairmount and St. Francis Hotels for rooms. Members who contemplate attending the convention should make their reservations through the two associations to protect these contracts. All reservations will be made through Thomas Finigan, vice-president Pierson, Roeding & Company, 118 New Montgomery Street, San Francisco.

Following is a partial list of members who are booked

for the "Red Special," tour de luxe, New York Central Railroad, leaving New York on Sept. 23, en route to the San Francisco convention:

C. Loomis Allen	Mrs. Elmquist	Charles C. Peirce
Mrs. Allen	Harrison R. Fehr	C. R. Phenicie
W. K. Archbold	Mrs. Fehr	Mrs. Phenicie

ANNUAL MEETING OF MANUFACTURERS' ASSOCIATION

Secretary H. G. McConaughy has announced that the annual meeting of the association will occur at the convention headquarters, in Yosemite Hall, Native Sons of the Golden West Building, at noon on Wednesday, Oct. 6.

MANILA COMPANY SECTION

The seventh meeting of the Manila joint company section was held on July 6. The paper of the evening was by J. N. Weaver, superintendent of power installations, on "Electric Motors versus All Comers." He described the different kinds of motor drive which are in use and discussed the advantages of electric drive with central station service under local conditions. The paper was discussed by the following: R. Lopez, superintendent of electrical distribution; W. B. Calfee, night carhouse foreman; W. A. Smith, purchasing agent; I. C. Hartigan, city electrician; B. H. Blaisdell, chief engineer of power plant; J. C. Rockwell, manager electric department; E. I. Jeffery, assistant chief engineer of power plant; L. S. Cairns, assistant general manager; C. E. Haywood, superintendent of track; L. L. Vincent, superintendent of electric testing, and C. N. Duffy, vice-president. In addition to the topic of the paper the discussion covered other live topics. Considerable interest centered in the effect of the induction motor on power house operation and the relation of the cost of coal to that of generating energy. Steam railroad electrification was also taken up, and Mr. Duffy pointed out that the controlling factor is the financial one. Were it not for the fact that steam railroads are not in a position to borrow the large sums of money that would be necessary in order to electrify the roads, and also because the railroads do not feel that they can afford to discard the present steam equipment notwithstanding the result in economies and advantages of electricity over steam, it would be only a question of a few years until the electric locomotive would supplant the steam locomotive just as the electric car has replaced the horse car. Referring to the cost of coal, Mr. Duffy said that the largest item of expense the company had was its payroll and next to that was the coal bill, aggregating 400,000 pesos (Spanish dollars) per annum

exclusive of the emergency coal tax of 1 peso per ton. Without the emergency tax the coal cost 80 per cent of the bare production cost of energy, and with this tax the cost was 88 per cent.

Steel Cars in City Service

One of the many arguments put forward in favor of all-steel city cars is that the damage to vestibules due to collisions with heavy trucks is much less with steel construction than with wood. The accompanying illustration demonstrates this theory in a rather striking manner, as the car in question withstood an impact at about 7 m.p.h. with a loaded motor truck weighing more than 16,000 lb. and with most of the weight concentrated in the plane of the heavy truck frame. The blow was sufficiently severe to knock the front car-truck off the rails.

The car in question, which was built by the Southern Car Company, has vestibule posts that are made of pressed steel throughout, the two center posts being made in one section of No. 16 gage steel and the corner vestibule posts in two sections of No. 12 gage steel riveted together. These posts are anchored to an angle-

ALL-STEEL CITY CAR AFTER COLLISION WITH MOTOR TRUCK

iron sprung to the proper radius and fastened to the 7-in., channel-shaped anti-climber which serves in place of the usual crown pieces. The vestibule sheathing is made of No. 16 gage steel bolted to the outside of the vestibule posts, and there is also a lining plate on the inside of the vestibule which provides pockets into which the sash may lower.

It will be seen from the illustration that the only real damage was caused by the tearing loose of one vestibule corner post from its anchorage to the anti-climber and that the platform knees and car-body corner post were only superficially injured. The platform knee is made of a flat plate of No. 10 gage steel reinforced by 2½-in. x 2½-in. and 3½-in. x 2½-in. angles. The car-body corner post is included in a pressed steel header of the deep "U" shape sheathed with No. 16 gage steel.

Aside from the necessity for straightening and riveting the vestibule post the only repairs were those made necessary by the tearing of the wooden exit door and the breaking of a couple of panes of glass, and the patching of one tear in the side sheathing at the bulkhead, and another further back due to a heavy blow from the hub of the auto truck as it was skidded around after hitting the car. The anti-climber was also bent slightly

at one point. However, as the frame of the car was not injured in any way, the wiring and control were not affected and the car was brought to the carhouse on its own wheels. Not a single passenger was injured, although several men on the front platform were thrown from their feet by the violence and suddenness of the impact, and only one of the women in the car fainted.

Bay State Passenger Department Moves

New Office Opened in Boston—Animated Sign a Novel Publicity Feature—Model of Bay State Open Car in Window

On April 1, 1915, the passenger department of the Bay State Street Railway moved its headquarters from 309 Washington Street to 15 Milk Street, Boston, Mass., the new offices being on the street floor and on the exact site of the house in which Benjamin Franklin was born on Jan. 17, 1706. The former offices of the department were located on the second floor of a building with inadequate elevator service, and while visited by many tourists yearly, were not on the same plane of accessibility as most of the other railway ticket offices in the district. Since their removal to the new site, within 150 ft. of the old headquarters, the offices have been visited by from two to four times as many persons each week.

The company shares the new offices with a dealer in hardwood floors, the department having about half the display window space and an area immediately behind which is about 16 ft. wide by 45 ft. deep. The office proper includes a counter for the sale of tickets, with time-table rack and grill with two doors, file safe and desks. The staff consists of Ralph M. Sparks, general passenger agent, a chief clerk, two assistant clerks, a stenographer and an office boy, five outside solicitors of passenger traffic also reporting to the head of the department. Henry E. Reynolds, assistant general manager of the company, has general executive charge of the solicitation of traffic. One cash and ticket drawer is assigned to each clerk and each drawer is provided with an independent lock and key for the use of the clerk responsible for its contents. The drawers are removed at night from the counter to the safe.

A novel electric sign has recently been placed in service at the door, which is only a few steps from Washington Street, the busiest thoroughfare in New England. The sign is about 8 ft. long, 6 ft. wide and 2 ft. deep

MODEL CAR SHOWN IN WINDOW

and is equipped with a motor-driven flasher wired to lamps behind a transparency simulating a moving car and operating automatic block signal system. In operation the signal in the panel shows a white light and flashes the word "Proceed" on the sky. The wheels then appear to revolve on a fast-passing track, the words "Safety First" appearing in the headlight beam. After a moment the signal displays a red light, and the word "Stop" appears. The wheels cease to turn, the track darkens and the headlight is cut off. The repetition of the clear signal begins the cycle anew. The sign was designed by Mr. Sparks and Howard W. Irwin, inspecting engineer of the company.

In the window is displayed a model Bay State open car 65 in. long, 23 in. high, 14½ in. wide and weighing 186 lb. The car is equipped with miniature head, tail and inside lights and full hand brake system and is wired for single-motor operation. It was recently borrowed for front window display and filled with dolls by a prominent Boston department store, and in this way the company received considerable extra publicity. A model of one of the first horse cars used on the system is now being completed for exhibition in contrast with the open type.

By co-operation with the Boston Historical Society, the company photographed a drawing of Franklin's birthplace and gave away more than 900 lithographs within three weeks after it was finished. Framed views of the house are being posted in fifteen of the principal waiting rooms, and a model 3 ft. high, in wood, has been placed in the office window. The department has good storage facilities for office supplies on an upper floor.

Card Records of Los Angeles Track Work

BY G. E. CAMPBELL, CHIEF DRAFTSMAN LOS ANGELES (CAL.)
RAILWAY CORPORATION

Realizing that engineering records are of value only when available for immediate use, and that availability is entirely a matter of proper indexing, the Los Angeles Railway in 1908 began to use the card index system in its drafting department.

Prior to 1908 all records of drawings were kept on loose sheets on an ordinary letter file hung on to the end of the chief draftsman's desk. These sheets were divided into the general heads of special work, buildings and maps. There were no subdivisions.

As might have been expected, sheets were continually being lost and a great deal of inconvenience resulted. Consequently the start was made here.

All records of special work drawings are kept in a separate index. Each intersection is indexed and cross-indexed under the name of each street appearing on the tracing. Should there be any part or parts that are detailed and likely to be of use at any other time they are indexed separately under a proper heading. Each intersection has a card or cards (Fig. 1) showing all work ordered for that location from time to time.

The company drawing number, a description of the work and the date are given on one line. This is followed by the file number for the key plan and the maker's name. When new work is ordered a new entry is made, leaving a blank line to separate the new and the old.

To avoid error due to lost cards, each one is numbered. When a new one is made a line is drawn under the number on the old one. The three cards (Fig. 1) marked Main and First Streets illustrate this.

All flat drawings other than special work are kept in a so-called "Miscellaneous Index." This is divided into such heads as bridges, buildings, cars, culverts, maps, rails and fastenings, special work (details), tables, etc.

Some subjects have an alphabetical index, culverts is an instance; in this case all culverts are indexed according to street location.

Maps of a large division are subdivided into such subheads as assessment, ballast, circuit breakers, joint track, opening and widening (of streets), right-of-way, etc. Buildings are subdivided according to use, amusement, carhouses, administration, power houses, stables, etc. Rails and fastenings, another large division, has such subheads as chairs, compromise plates, drillings, paving blocks, etc. Compromise joints are further divided according to make and section.

The special work head in this index does not apply to layouts but to material. Crossings are noted according to angle; switches and mates by radii and sections, frogs by angle, radii and section.

A little use confirmed the belief that cards were the proper medium and the system was applied to other records.

The railway system is composed of seventy-one construction divisions, six carhouses, four yards and a gravel pit.

Each division has its profiles and track maps made on white mounted paper to a scale of 30 ft. to 1 in. There are separate drawers, with a separate system of numbers, for each of these. These are shown graphically on wall maps, where the numbers and limits of each piece are shown. For current maps and profiles this is more quickly used than the index.

Each day's field work is recorded in a journal. From this journal two sets of cards are made, one for field and one for level notes. These are filed under divisions and give a description of the work with the book and page.

Each field and level book contains a card on which is recorded the date and by whom taken and the date of return. In this way it is possible to know where each book is.

All deeds, leases and agreements, to and from the company are indexed under the name of the division or

LOS ANGELES TRACK RECORDS—FIG. 2—DETAIL RECORD OF RAIL AND SPECIAL WORK LAID AT A GIVEN LOCATION

list of old names with the new one opposite is therefore kept on cards.

All trade catalogs are indexed under the firm name and the goods listed therein. Daily building reports, United States topographical sheets, county record maps for revising our wall maps, are also kept in this way.

Records of all rails laid, section and date, and of all paving were kept on the mounted paper track map. It was found impossible to keep these posted without injuring the maps, consequently 5 in. x 8 in. cards (Fig. 2) were bought.

Using the red top line as the center line between tracks, a miniature track map is made on a scale of 200 ft. per inch. The widths are exaggerated to allow more working room. There are two sets of these, one for rail, the other for ballast and paving. Each rail section is shown by a proper color while below is a record of the stations to and from, rail section and date of the report.

On the paving cards parallel lines of wash color are used, the inner one for ballast, the outer one for top paving. The same record of location, date, etc., is kept below as for the rails. On the rail card a record is also kept of the special work at each location, the type and drawing number of the railway's drawing and of the key plan being given.

The cards (Figs. 2 and 3) for the East Seventh and Stephenson divisions are typical.

Wall maps show this graphically for the entire system, a separate map being used for each.

The company is satisfied that it has an index system capable of being enlarged to meet almost any needs, and until some much better system is devised it will continue to use cards.

Brush-Holder Practice for Single-Phase Motors

BY R. R. POTTER, SUPERINTENDENT OF EQUIPMENT NEW YORK, WESTCHESTER & BOSTON RAILWAY

Brush-holders for railway motors constitute one of the most vital parts of the equipment, as they must be in nearly perfect condition at all times in order to perform their duty, notwithstanding the fact that they are subjected to very severe wear and to exceedingly difficult operating conditions. When it is starting the motor armature requires an excessive amount of current which must be delivered to it through the brush-holders and brushes, and this is often greatly in excess of the capacity of the brush. The result is a relatively rapid electrical erosion as well as mechanical wear on the brush-holder boxes, or guides for the brushes, and also on the pressure fingers. This is especially true of single-phase a.c. motors as they require very large currents on account of the low voltage for which they are generally wound. Also, since the brushes are required to be as thin as possible the current per unit of brush area is very great.

These troubles were in evidence during the early operations of the New York, Westchester & Boston Railway, and tests were made with shunts on the brushes to remedy the difficulty. But while the excessive wear or burning of the brush-holder was thus prevented, it was difficult to develop a shunt attachment to the brush which would stand the load, and the great additional cost of the brushes with the shunts made them uneconomical. The rapid wear was, therefore, accepted as inevitable, and from observations that were made on the motors it was determined that the permissible limit of the wear for the brush-holders was reached when the box or guide had become 1/32 in. larger than the brush, which was 3/8 in. thick.

Practically all of the wear occurs at the lower portion of the box, or that which is nearest the commutator. When the box is badly worn the conditions are such, as will be seen from the sketch, that when the motor reverses after running a considerable time in one direction, the brush moves so that only a line of contact instead of a surface is presented to the commutator. Naturally, such a reduction of contact area causes a very rapid wear of the brush, and sometimes induces the flashing over of the motor, so that the above wear limit had to be established and rigidly maintained. However, with twelve brush-holders per car a heavy expense was involved by maintaining the wear limit in case the brush-holders were scrapped as soon as the slots became worn 1/32 in. large, and in order to minimize the cost the following method of repairing the old holders was devised:

A substantial frame or jig for the brush-holder was made in such form as to support the three sides of the brush box and to hold this casting in shape regardless of the pressure put upon it. A broach having the same length as the slot in the brush box and 1/8 in. greater width than the original size was also constructed. To repair a brush-box the broach is forced through the slots in the brush box, the wheel press being

BRUSH RUNNING ON EDGE BECAUSE OF WORN BRUSH BOX

BRUSH-HOLDER WITH WEAR PLATES IN BRUSH SLOTS

used to apply pressure. Pieces of hard brass of the same length as the slots and 1/16-in. thick are then riveted to each side of the slot, a steel block being inserted in place of the brushes while riveting so that the rivets are headed on the inside. This block also insures that the proper shape of the slot will be maintained. The copper rivets used for the operation are, of course, countersunk on the inside of the slot, each strip of brass being held with four rivets, as this number has been found to be ample.

This work can be accomplished for about 50 per cent of the cost of a new brush-holder, and when the brass wear plates are worn down in turn to the wear limit of 1/32 in. they may be replaced for a very small percentage of the first cost, because no broaching operation will be necessary in renewals of the wear plates.

A Split Self-Lubricating Trolley Harp

BY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA) SERVICE COMPANY

Self-lubrication, perfect contact and an average life of 10,000 miles have been obtained from a trolley harp which is used by the Sioux City (Iowa) Service Company. Essentially this harp is made of malleable iron and in two sections, one of which is shrunk on the axle to insure perfect contact, the other of which is screwed on the axle. This harp is clamped on the trolley pole by a 5/16-in. x 1 3/4-in. bolt. The axle is made of cold-rolled steel, 1 7/16 in. x 1 3/4 in. in size with three 1/2-in. x 1 1/4-in. holes drilled along one side. In these holes three

SIOUX CITY SELF-LUBRICATING TROLLEY HARP

small piano-wire springs and two 1/2-in. x 3/4-in. graphite lubricating plugs are placed. This combination of the springs and the plugs insures continuous pressing of the graphite against the bearing of the trolley wheel. Fiber washers are interposed between the trolley wheel hubs and the harp to reduce friction at this point and to prevent excessive wear.

Equipped with a 4 1/2-in. trolley wheel which is used in city service, this harp and wheel complete weigh 6 lb. The company does its own machine work in connection with the manufacture of these harps and wheels. The castings, however, are made outside, but their design is

furnished by the company. This type of trolley harp has been used on the Sioux City cars for more than ten years, and a number of the axles have been in service four years. As a rule the fiber washers are only applied to take up wear when wheel renewals are made. The graphite plugs provide such perfect lubrication that oiling is never necessary, hence the car roof is always clean. Experience has been that these wheels need no attention so far as lubrication is concerned until a wheel is renewed. At that time new graphite lubricating plugs are provided. This, of course, makes inspection of the bearings unnecessary while the wheels are in service. A sketch of one of these harps is shown in the accompanying illustration.

Helical Springs

BY "VULCAN," A.M.I.C.E., A.M.I.E.E., ENGLAND

On many street railway systems the large helical compression springs have given little trouble, whereas on others frequent failures have been experienced; the latter has been the case in many parts of Great Britain where additional weight, caused by covering over the upper decks has been imposed upon the original trucks.

Besides increasing the weight of the car body, the top deck covers raise the height of the car center of gravity, especially when loaded, because the upper decks of such cars commonly attract more passengers than do the lower decks; consequently they are more subject to rolling from side to side than are other cars. Such cars impose a somewhat severe duty on the supporting springs.

On one system which came under the writer's notice this subject had attained considerable importance owing to the excessive number of springs which had been fractured. These were of the usual helical type which support the trucks from the journal boxes. The breakages had reached the figure of many hundreds per annum, and although this meant considerable expense for replacements, of more importance was the fact that broken journal-box springs caused top-covered cars to lean over to an alarming extent.

Of course, the state of the track, which was undoubtedly in extraordinarily bad condition, was blamed, but the real cause of the trouble was that the design of the springs was at fault, which was proved to be the case when new springs of different dimensions were substituted; experience showed these latter to be satisfactory in every way.

The compression of a spiral spring is directly proportional to the load it carries; the stress in the material of the spring is also proportional to the deflection. Consequently when the compression is at a maximum, i.e., when the spring is closed up, the greatest possible stress that the material will ever have to withstand in use will be reached, and the value of this figure should be well within the breaking stress.

It is, of course, an easy matter to keep on the safe side by adopting an excessively strong spring, but in this case the effect on the riding qualities of the car would be equivalent to having no springs at all; the same effect will be produced if the springs are too weak to support the car when stationary, for in that case the coils will close up and rest on each other.

In getting out a new design the object must be to provide a spring which will remain open under ordinary conditions, but which if absolutely closed up by abnormal circumstances will not break under the maximum material stresses then obtaining.

For body or journal-box springs the over-all dimensions are usually not difficult to settle; the diameter of the material of the spring and the spacing of the coils best suited to the situation is not so easy to define. In

many cases the latter dimensions are obtained by trial and error methods. However, this is not a satisfactory process compared with the system of calculation to which the subject is well suited.

The following formula (A) will enable the shear stress in the material of a spiral spring to be found when the steady axial load is known; this, of course, only obtains when the coils remain separated under load:

$$f = \frac{16WR}{\pi d^3} \quad \text{or} \quad \frac{5.1WR}{d^3} \quad (A)$$

Where

f = material stress in pounds per square inch maximum working values for which use 70,000 lb. for $\frac{3}{4}$ -in. diameter material, and 65,000 lb. for 1-in. diameter material,

W = steady load on spring in pounds,

R = mean radius of spring in inches,

d = diameter of rod in inches.

To find the compression of the spring under steady load the formula (B) can be used.

$$\Delta = \frac{4\pi f R^2}{Nd} \quad (B)$$

Where

Δ = deflection per coil,

f = stress in material, pounds per square inch,

R = mean radius of spring in inches,

N = torsional modulus = 11,000,000 lb. for steel,

d = diameter of rod in inches.

In designing a new spring the coil spacing should, of course, be greater than the deflection per coil under a steady load.

We have as yet only dealt with the condition of steady loading, but owing to bad track or to obstructions on the rails, the springs may at times be compressed an amount greatly in excess of the normal, and as the material stress is proportional to the compression, the latter must be limited in some way so that the stress shall under no circumstances reach the breaking point. This is best done by so arranging the spacing of the coils that when the limiting stress is reached, the spring

shall be closed up. The maximum allowable compression per coil, or the maximum coil spacing, can be ascertained by substituting for f in formula (B), the limiting stress, which for good steel can be taken as 110,000 lb. per square inch.

In the accompanying figure is shown a successful journal-box spring for which the following calculations are made by way of illustration. The steady load W on the spring is 2 tons.

By (A)—Steady load stress,

$$f = \frac{5.1 \times 2 \times 2240 \times 2}{1} = 45,700 \text{ lb. per square inch.}$$

By (B)—Compression per coil under steady load,

$$\Delta = \frac{4 \times 3.1416 \times 45,700 \times 4}{11,000,000 \times 1} = 0.209 \text{ in.}$$

By (B)—Ultimate material stress when spring is closed,

$$f = \frac{\Delta Nd}{4\pi R^2} = \frac{0.5 \times 11,000,000 + 1}{4 \times 3.1416 \times 4} = 109,000 \text{ lb. per square inch.}$$

Box-Frame Motor Practice

In last week's issue of the *ELECTRIC RAILWAY JOURNAL*, page 367, R. R. Potter, superintendent of equipment New York, Westchester & Boston Railway, described the methods used in the shops of that company for removing armatures from box-type motor frames. The September issue of the *General Electric Review* contains an article on the same subject by J. L. Booth of the railway motor engineering department. Mr. Booth states that the demand for box frames has increased until at the present time they have almost entirely superseded the split frame, from 80 to 90 per cent of railway motors now being made being of this type. He gives the following advantages of the box frame as compared with the split frame: For a given space and weight a larger output can be obtained. It possesses greater structural strength and durability. The lower half of malleable iron gear cases can be supported more substantially. The elimination of the joint gives an unbroken magnetic circuit and prevents oil from working into the interior of the motor. A greater freedom of design is generally obtained for armature, pole pieces, coils and axle-bearing housings. With a ventilated motor a greater space is available for the passage of the cooling air around the field coils. Better protection is afforded to the field-coil connections, which are inside the frame. The removal of the motor from the truck for repairs results in these being made under favorable conditions. There are fewer parts liable to work upon each other. The greater reliability reduces maintenance costs.

Experience has shown that the removal of the motor from the truck for repairs is not objectionable and repairs upon box-frame motors are to-day being executed just as rapidly as those upon split-frame motors. Some users consider that less time is necessary due to the superior working conditions which exist when the motor is off the truck. The removal of box-frame motors from single-truck cars presents no difficulty. The axle caps and bolts are first removed and the gear case taken down. The motor is then supported from the pit by a jack bearing against the center of the motor frame. The suspension bolts are next taken out (if the suspension is of the bolted-bar type) and the suspension bar is unbolted from the truck. The motor may then be raised by the jack and moved away from the axle sufficiently far to allow the portion of the axle-bearing housing that projects over the axle to clear it. The motor may then be lowered into the pit. If preferred the axle may be used as a fulcrum and the motor swung around the axle until the bearing housings are clear.

No elaborate equipment is required for removing a truck from a double-truck car. In most carhouses two pairs of chain blocks can be arranged to lift one end of the car while the truck is being removed. On a large system in the Middle West, using motors weighing with gear, gear case, pinion and axle lining, approximately 3045 lb., the truck is run out from under the car and the suspension bolts, gear case, axle caps and linings are removed, the dust guard coming away with the axle caps. The motor is then lifted out by means of bails and an ordinary pair of chain swings. The four bolts securing the pinion-end framehead are next removed and the head is started by jack screws. A lever, having a collar at one end which fits over and is clamped to the pinion, is used to support one end of the armature, which is then pulled out sufficiently far to enable a wide lifting strap to be placed in position. The length of the bearing at the commutator end is sufficient to support that end of the armature until the lifting strap is in place. By bearing down on the end of the lever, the weight of the armature

can be balanced while it is being removed from the frame. By this method the time necessary to remove and replace an armature after the truck has been taken out from under the car body is as follows: Removing the axle caps and suspension bolts, and raising the motor frame from the truck, fifteen minutes; removing the framehead bolts, forcing off the frameheads, clamping the lever to the pinion, placing the lifting staff in position, removing the armature and lowering it upon the floor, twenty minutes; picking up the armature, replacing it in the shell, bolting up the frameheads, lifting the motor and placing it on the truck ready for service, twenty-five minutes; time from that at which the truck is taken from under the car until the motor is remounted and the truck ready to be replaced, one hour, which period can, if necessary, be reduced to forty-five minutes.

The method used by another road for removing the armatures from GE-222 motors, which weigh complete 4260 lb., is as follows: The motor is turned on end by slings in the usual manner, the air intake pipe being first removed and a sling with hooks being attached to one of the bails on the motor frame and to an eyebolt screwed into one of the axle-cap bolt holes. For removing the armature the chain swings are replaced by scissors-like clamps which fit under the pinion teeth. The armature is then withdrawn and stood vertically on blocks while the clamps are replaced by a light chain before the armature is laid flat on the ground.

A road operating a large number of GE-200 box-frame motors is using an extension of the armature shaft to support one end of the armature while it is being dismantled. The pinion-end framehead is removed and the head at the commutator end is replaced by a malleable-iron bracket which fits the bore of the frame and is held in place by two tap bolts. This bracket carries a machined roller of such a diameter that the extension of the armature shaft is kept in the center of the frame. This extension is a steel tube, machined on the inside to just slip over the armature shaft. The shaft at the other end is supported by an oak pole 3 in. in diameter, having a steel tube at one end of it that fits over the armature shaft. The armature is moved out horizontally and is supported at one end by the roller until it is clear of the frame.

In another road a somewhat similar method is used, an iron pipe, having one end bushed with brass to avoid injuries to the armature shaft, being used to support one end of the shaft. The armature is lifted by slings and moved out of the frame horizontally by an overhead traveler. On still another road the armature is held stationary and the frame is moved. The armature is supported by jacks, a bushed pipe being used at one end, as previously described. The frame is carried on a truck rolling on rails which is moved along until the armature is clear.

In concluding his article Mr. Booth also described the special machine with centers mounted on a base plate, which was mentioned also in Mr. Potter's article.

Application of Different Welding Processes

As an example of the fact that welding by the electric arc, by electrical resistance and by the oxy-acetylene flame each has a distinct field to which it is most suitable, it may be said that an English corporation which manufactures steel wheels and also specialties in autogenous welding processes makes use of all three methods. The longitudinal joints in the barrels are made by arc welding and the resistance process is used for attaching the heads to the drums. Oxy-acetylene welding is not used in connection with the barrels, but is used for making articles of a more complex character, which

are required only in small quantities, the flexibility of the process making it especially valuable in such cases.

Insulating Pipe Joints

The MacAllen Company, Boston, Mass., has recently brought out an improved type of insulating joint to prevent the flow of stray electric current through pipes, conduits or rods. The joint is octagonal in shape, the shell being made of seamless drawn steel and the nipples into which the pipe ends are screwed being machined from steel rods. The insulating material is a vulcanite compound that is not affected by heat or oil and is, in fact, practically indestructible. This surrounds the nipples and is inclosed in the steel shell so that ample physical strength is provided.

EXTERIOR AND SECTION OF INSULATING PIPE JOINT

These joints have already been used to a large extent by the manufacturers of air-brake equipment as a part of their standard insulation, and recently, they have come into use for insulating steam pipes and rods that are subject to electrolytic influence. The joints are made in standard gas pipe sizes, from $\frac{1}{4}$ in. to 2 in., all of them being tested to 150 lb. air pressure. High-pressure joints are made to order and these can be tested to any specified pressure, so that they can be used for hydraulic and steam mains as well. The joint that is intended for insertion in lever, stay and brace rods when it is necessary to insulate one part of the rod from the other is, of course, tapped for machine-screw threads and this type is made in standard sizes for rods ranging from $\frac{1}{2}$ in. to 1 in. in diameter.

New Track Scraper

The snow-fighting equipment illustrated in the accompanying engraving is the latest development of the Root Spring Scraper Company, Kalamazoo, Mich., and is known as the No. 6 scraper. It is 12 ft. long and is designed for mounting under the ends of service cars at an angle of 45 deg. to the rails, and to be used in connection with wings. The projection of 3 ft. outside the rails cleans the devil strip, and the blades are made in two sections so that they will accommodate them-

NO. 6 SCRAPER WITH WINGS, ATTACHED TO SERVICE CAR

which can be adjusted to suit the convenience of the operator.

The commutator truing or grinding attachment consists of a traveling grinding wheel, supported by the tailstock and direct motor driven. Two steel rods project backward from the tailstock, and sliding on these rods is a casting which supports two other rods parallel with the face of the commutator which carry a $\frac{1}{2}$ -hp. motor and the grinding wheel. These rods are adjustable in or out to suit the length and location of the commutator. The grinding wheel is moved along the rods by means of a screw and handwheel and is fed against the commutator by a screw. Cutting is done in both directions of travel of the wheel. When this attachment is not in use it is simply moved back out of the way and no part is disturbed. The rods and all

erating clutch being absolutely necessary for successful banding or coil winding. The exterior part of the clutch is free to revolve upon the shaft and is crowned ready to receive a belt from the line shaft direct, no countershaft being necessary. For direct motor drive, a gear is bolted to the loose member of the clutch and the motor is placed upon a suitable support at the proper height to suit the pinion used with the motor. The motor capacity required is $1\frac{1}{2}$ hp., 900 to 1200 r.p.m.

The headstock is a massive casting and contains all the reduction gears, which are thus thoroughly protected. Power is transmitted from the lower driving shaft by a steel chain to a double set of gears of different diameters in the headstock, either one of which may be thrown into engagement by a lever. This lever may also be thrown into a neutral position, in which case

HEAVY DUTY UNIVERSAL ARMATURE MACHINE

other parts are made heavy to prevent springing and chatter.

A coil-winding plate is mounted on the outer end of the spindle and this is arranged to take all standard sizes of armature and field coil forms. As its speed is under instant control of the operator, it is suitable for all classes of work from the lightest to the heaviest.

The machine is heavily built throughout, all castings being thoroughly ribbed, and the bed consisting of a heavy steel section, planed true on the bearing surface and mounted on legs which support the main drive shaft. The machine is stopped and started by foot treadle which runs the full length of the machine, so that control is possible from any location. When the treadle is depressed to stop the machine, a locking brake is automatically applied to the drive shaft. The treadle is connected to an automobile-type, leather-lined cone clutch for controlling the machine by connecting to the main drive shaft. This type of clutch is simple and will positively not jerk when engaging, a smoothly op-

erating clutch being absolutely necessary for successful banding or coil winding. The exterior part of the clutch is free to revolve upon the shaft and is crowned ready to receive a belt from the line shaft direct, no countershaft being necessary. For direct motor drive, a gear is bolted to the loose member of the clutch and the motor is placed upon a suitable support at the proper height to suit the pinion used with the motor. The motor capacity required is $1\frac{1}{2}$ hp., 900 to 1200 r.p.m.

The two gears on the first shaft above mentioned engage with two corresponding gears on a second shaft, giving two instantaneous changes of speed while the machine is running. This second shaft on the outside of the headstock carries a driving pinion which engages the face-plate gear. Self-contained with this gear is the driving dog, which is clutched between the teeth of the pinion on the armature, all extra attachments for this purpose being eliminated.

The *Mechanical World* states that the Swiss Federal Railway authorities have decided on the construction of a large new hydro-electric station at Massaboden, near Brigue, to supply energy for the trains operating through the Simplon tunnel. The station will replace the temporary power station now established at the north end of the tunnel.

LONDON LETTER

Petrol-Electric Car for Dublin—Service on Electrified London & South-Western Lines—Problems Presented by Depletion of Ranks of Tramwaymen
(From Our Regular Correspondent)

A novel combination of the petrol-electric principle is being applied to the Dublin-Blessington Tramway, which runs for 20 miles in the environs of Dublin. The road traverses an interesting residential, resort and scenic district. For certain reasons the overhead trolley, which has been adopted on a part of the line, could not be used throughout its length. The cars are so designed that they may be self-propelled by the combination of petrol-electric power when on parts of the line not equipped with overhead trolley. On the lines where the trolley can be used the petrol engine will be cut out. Double-deck cars mounted on double trucks will be employed. The bodies will be divided inside into two compartments, for first-class and third-class passengers respectively. The entrance will be in the center of the car. The driving axle of each truck will carry a 65-hp. Westinghouse motor. The self-contained power unit will be a 65-kw., 500-volt, compound wound direct-current generator, direct driven by a six-cylinder petrol engine developing about 105 b.-hp. This generating set will be mounted in a compartment at one end of the car. The control apparatus will be in duplicate so that the car can be run from either end.

The self-propelled car for Dublin is much the same type of car as that supplied by the British Westinghouse Company to the London & North-Western Railway for its branch line from Penygross to Nantlle. In the North-Western car the petrol motor is of 90 hp., connected direct to a 600-volt dynamo. A battery is provided and charged from the dynamo for lighting purposes, and also to drive the electric starter for the petrol engine, which is kept running while the car is at rest at the stopping places.

In connection with the electrification of the suburban section of the London & South-Western Railway it is announced that the circular route by Kingston will be put in service this month. As soon as the trains are running on this section the others will be completed in quick succession. These are the Barnes to Twickenham (via Hounslow), Thames Valley line to Shepperton, Malden to Hampton Court, and Hampton Court Junction to Claygate. The Kingston loop line includes all stations from Waterloo to Kingston via Wimbledon, and back to Waterloo through Richmond, Mortlake, Barnes, etc. Direct current at 600 volts will be supplied to the trains from a third-rail at the side of the track. The power station is near Earlsfield Station, and the current will be distributed at 11,000 volts to substations by insulated cable, of which 76½ miles have been laid on the section now in hand. Altogether, 140 single-line miles of track will be electrified. Each train will consist of units of three coaches permanently coupled together, the trains to comprise three, six or nine coaches, according to traffic requirements. Each unit is fitted with four motors, mounted in pairs on the bogie beneath the driving compartment. The coaches will be heated by electricity.

The details of a light railway scheme, intended as a first step toward the planning of a new seaside resort for Lancashire, were recently inquired into by the Light Railways Commission sitting at Formby. The proposal is to carry a line of electrified railway to Formby headland, the most seaward point of West Lancashire, and to make that district, which comprises an unusual stretch of firm beach backed by undulating sandhills, accessible to Lancashire holiday-makers. The Lancashire & Yorkshire Railway has been induced to take the matter up. The proposed Formby Light Railway is to be constructed by the addition of a loop to the existing electric line running between Liverpool and Southport. The new line at its most southerly point will join the existing line at Hightown Station, and branching to the west will skirt the Altcar Rifle Range and War Office new encampment, and thence follow the contour of the coast line, coming round in a loop and rejoining the present line almost on the Southport borough boundary. Its total length will be nearly 7 miles, and the estimated cost is £62,650.

The annual conference of the Tramways & Light Railways Association discussed the growing difficulty which tramway undertakings throughout the country are experiencing owing to the increasing number of men who are leaving for war service. The reduction in the number of drivers and conductors can be met by running fewer cars or by employing women conductors, but the steady departure of skilled workmen from the repair shops for the army and for munition factories presents a more serious problem. J. Devonshire, managing director of the London United Tramways and the Metropolitan Electric Tramways, said that the council of the association had come to the conclusion that the companies must try to get for the men employed in the repair shops the special form provided for munition workers. This form would be stamped with the words "public utility service." The council had succeeded in arranging with the Minister of Munitions that if this arrangement was carried out these men would be regarded as sacrosanct. The conference decided not to take any steps to secure exemption for drivers and conductors. It was announced that the Board of Trade had agreed to the inclusion in one Parliamentary bill of all applications for extension of time for the completion of authorized lines. This should be a considerable advantage, because under the present war restrictions a great deal of new work is being delayed.

At the same conference a paper was read by J. W. Dugdale, general manager and engineer of the Oldham Corporation Tramways, in which he said:

"Workshops, railways and motor cars appear to have been paced to the uttermost limit, but the military authorities have never once thought of taking into their confidence any principal connected with any of our undertakings, except, of course, for free riding upon tramcars. There is, in my opinion, plenty of scope to which our vehicles could have been put. The transport of the wounded, for instance, the removal of convalescent soldiers from various hospitals to convalescent homes, and the carrying of munitions in their various stages of production from one firm to another. The number of tramway employees who have given their services for the war reaches a total of 18,057 men, which is about 30 per cent of the total number of men employed on tramway undertakings. The cost to the departments mentioned for allowances or grants per week at the present time is very high. For the London County Council it is £1,568; Glasgow, £1,000; Liverpool, £520, and Manchester, £1,360."

As regards present and future prices of materials, Mr. Dugdale pointed out that "tramway concerns are now handicapped in obtaining quick deliveries of material, such as car wheels, axles, tires, etc., and this has been brought about by the makers not being able to execute orders promptly on account of pressing Government work." He said:

"There is no doubt that tramway concerns will be called upon to pay inflated prices for materials of every description. There will be a great rush for tram rails in the very near future, as the life of those laid on many systems in the year 1900 will become exhausted. This is a very important factor, which will have to be closely watched, as the prices per ton will increase considerably. Already tram rails have advanced in price to £9 5s. a ton."

The Birmingham Corporation tramways committee has engaged about twenty women to act as conductors on the Pershore Road route. A letter has been received by the committee from the Tramwaymen's union stating that the men are willing to work with the women and to render them every possible assistance.

Some interesting figures are contained in the report of the London County Council tramways for the year ended March 31, last. The length of lines in operation was 145¾ miles, of which 5¾ miles was worked by horse traction. The total revenue was £2,400,847, and the working expenses, £1,658,362, leaving a surplus on working of £741,485. The number of car miles run was 58,978,792, and the number of passengers carried 550,497,993, and the average fare per passenger was, for electric traction, 1.02d., and horse traction, 0.76d. The average number of cars was 1384, and the average car miles per day per car was, for electric, 117, and horse, 77. The average speed of the electric cars was 8.95 m.p.h. and of the horse cars 5.85 m.p.h. The total debt incurred up to March 31 was £13,744,806. Allowing for debt repaid and sinking fund balances and for surplus land valued at £122,216, the net debt on March 31 was £9,836,186. A. C. S.

News of Electric Railways

RAPID TRANSIT EQUIPMENT CONTRACTS

More Than \$1,800,000 of Track Material Contracted for in New York

The Public Service Commission for the First District of New York has awarded the following contracts for track materials to be used upon various lines of the dual rapid transit system:

Untreated ties and timber—J. H. Burton & Company, \$1,273,856.

Treated ties and timber—Long Leaf Pine Company, Inc., \$100,362.

Special work, Order No. 3—Ramapo Iron Works, \$54,960.

Special work, Order No. 4—William Wharton, Jr., & Company, \$41,907.

Cast iron—American Brake Shoe & Foundry Company, \$10,528.

Screw spikes—American Iron & Steel Manufacturing Company, \$25,741.

Felt pads—Q & C Company, \$9,957.

Malleable iron—Foran Foundry & Manufacturing Company, \$36,118.

Tie plates, Type "A"—Herbert W. Lockwood, \$123,975.

Tie plates, Type "B"—L. D. Rockwell, \$13,267.

Tie plates, Type "C"—L. D. Rockwell, \$5,140.

Tie plates, Type "D"—Herbert W. Lockwood, \$8,239.

Tie plates, Types "E," "F," "G" and "H"—Herbert W. Lockwood, \$17,139.

Tie plates, Types "E-2," "W" and "X"—Ramapo Iron Works, \$2,901.

Bolts and nuts—Oliver Iron & Steel Company, \$117,910.

Cut track spikes—Herbert W. Lockwood, \$34,338.

The differences between the Public Service Commission for the First District of New York and the Board of Estimate & Apportionment in regard to the terms of construction contracts, which threatened to involve delay in the completion of the Broadway subway in Manhattan, have been settled and the work will proceed. The point in question was a clause in the contract for the construction of that portion of the Broadway subway between Thirty-eighth and Fifty-first Streets, which permitted the chief engineer of the commission to agree with the contractor either upon unit prices or a lump sum for extra work not provided for in the schedule of unit prices upon which the contractor made his bid. This contract was awarded to the Holbrook, Cabot & Rollins Corporation, the lowest bidder, for \$3,740,913. The law requires that the Board of Estimate & Apportionment consent to such contracts and appropriate the money to pay for them.

In this case the board consented to the contract on condition that the lump sum clause for extra work be stricken out. The contractors objected and the commission, under advice from its counsel, declined to amend the contract to comply with the Board of Estimate's condition, holding that it had no right to alter the terms of the contract and that its action in consenting to the contract with conditions amounted to disapproval. Holbrook, Cabot & Rollins applied to the Supreme Court for a writ of mandamus to compel the Board of Estimate to give its consent without conditions. This application was allowed by Justice Clarence J. Shearn, who issued a writ during the week. His decision sustained the position taken by the Public Service Commission. At its meeting following the decision by Justice Shearn, the Board of Estimate acted in accordance with the decision of the court and gave unconditional approval to the contract upon the understanding that the commission will confer with the Board of Estimate as to any lump sum extra allowance in excess of 5 per cent of the value of the contract before allowing the same. This understanding was in conformity with a suggestion made by Chairman Edward E. McCall of the commission to the Board of Estimate. That board is still of the opinion that it has the power to alter the terms of contracts made by the commission and expressed its intention of testing the question in the future. Not wishing to delay the construction of the dual system, however, it yielded the point as

to this contract and two contracts in Brooklyn having similar clauses. This action clears up the situation and the Public Service Commission will now proceed to execute all the contracts as to which the Board of Estimate made objection so that work may begin at once.

PHILADELPHIA COMMISSIONER REPORTS

An Outline of Some Features of the Report Issued by Transit Director Taylor for 1914

Transit Director Taylor of the City of Philadelphia, Pa., has issued the annual report of his department for 1914. In his letter submitting the report to the Mayor, Director Taylor reviews his recommendations and the work accomplished by his department, paying particular attention to the relocation of sewers. He goes at length into the legislative and legal features of transit work. All the aspects of the transit plans, constructive, legal and financial, are explained in detail. The report contains exhaustive tables giving the expense of the undertaking and the estimated returns to the city and the operator. The entire transit program as outlined at the conferences between Director Taylor and the officials of the Philadelphia Rapid Transit Company is included.

A feature of the report is the director's description of the methods employed in conducting his investigations into the transit problem. In the first place, he made a detailed study of the population and of its location. From the records of the County Commissioners was obtained the number of assessed voters in each ward for December, 1909, and December, 1911. Then the increase in population by dwellings was obtained. Next came the problem of determining how the population traveled, and a traffic survey was conducted. Passengers on every car out of five were counted on about four lines each day. Two men were placed on each car, one handing an identification slip to each passenger, the second collecting it and asking the passenger's destination.

The survey extended over a period of five weeks, from Oct. 14, 1912, to Nov. 18, 1912. Information was thus obtained of the volume of traffic flowing to all sections and the capacity of existing facilities to move it. This information, together with the probable increase of population, showed the general channels which require relief by high-speed transit. Following these calculations came the selection of routes, the estimation of the number of cars which would be required to move the population, the time which would be saved and the cost of the work.

After the selection of routes, profiles and detail drawings were made on which to base estimates of the cost of the work. A large number of estimates were then prepared, a general design was adopted, a time was set for construction, and unit prices of construction cost were taken from bids on similar classes of work in other cities. Estimates of earnings and operating costs were then made in great detail.

In submitting his report to the Mayor, Director Porter reviews and emphasizes the importance of the recommended subway delivery loop. In effect, he holds such a loop to be necessary to the commercial success of the Broad Street subway, because, he contends, the North and South Broad Street line will collect traffic from twenty-seven stations outside the business district. Without the loop, virtually all of this traffic would have to be handled in two stations, while with the loop seven additional stations would be provided. The director estimates the number of persons who will use the Broad Street line at 500,000.

In reference to the much discussed tube under the Delaware River, the director says:

"In any arrangement made by the city with a private corporation for operating the city-built rapid transit lines it should be required that such corporation secure the construction of and equipment of a tube under the Delaware River to Camden, connecting with either or both the existing Market Street subway and the recommended Chestnut Street subway."

RHODE ISLAND ARBITRATION HEARINGS

Hearings are being continued at Providence, R. I., in connection with the wages arbitration on the system of the Rhode Island Company. W. D. Wright, superintendent of equipment and maintenance, a recent witness, testified as to working conditions in the shops. Differences in the work of machine hands were responsible for variations in the hourly rate of pay, and in the cases of two shop foremen the different rates were due to the increased responsibility in one case as compared with the other. Painters who got 23 cents an hour did no varnishing, while those who were paid 25.5 cents performed this work. The maximum number of men in the department was 225. At present only 159 were at work. Relative to work in the paint shop, Mr. Wright said that while apparently the men were performing the volume of work previously handled by a larger force fancy lettering and certain other refinements had been eliminated. Counsel Swift for the company brought out the point that a recent layoff for eighteen weeks of a number of men was ordered by the management and, in his opinion, was caused by jitney competition.

During the hearings in the week ended Sept. 4 the point was brought out that in certain cases men for whom no work was available at the rate of \$2.25 a day were given the opportunity to work for \$1.75 rather than to be laid off entirely. The work of switchboard operators was again reviewed. A witness contended that the duties of a line-man in the company's service were more severe than on the system of the Narragansett Electric Lighting Company, Providence. Under cross-examination, the point was brought out that a first-class man could learn to do the witness's work in two or three days. The compensation for this work was 30 cents an hour. Evidence bearing upon the cost of living was presented on Sept. 1 on behalf of the union by Arthur Sturgis, Boston, an electric railway engineer formerly employed by the Bay State Street Railway. The witness cited the well-known views of Prof. Irving Fisher of Yale University, relative to the purchasing power of the dollar and contended that while wages had increased 14 to 15 per cent in the last fifteen years on the Rhode Island system, the cost of living had risen to a degree which made wages lag 19 per cent behind purchasing power. Mr. Sturgis contended that a minimum wage of about \$1,000 a year should be established in order to enable employees to maintain a proper standard of living.

ANOTHER STRIKE AT HOLYOKE

Employees of the Holyoke (Mass.) Street Railway went on strike for the second time within a month on Aug. 27. The strike followed a conference with officials of the company upon the establishment of a working agreement defining the duration of the period to be covered by a previously arranged arbitration of differences in dispute. The men desired a working agreement to expire June 1, 1916. The company called for a three-year agreement. At a conference prior to the strike vote, the company offered first to submit this difference to the board of arbitration recently appointed, with a second proposition that if this were unsatisfactory to the men to submit to the arbitration committee the question whether the time-limit of the working agreement was a proper one to be handled by this committee. Representatives of the union stated that the objection to signing an agreement extending beyond the date named previously arises from the fact that the wages and conditions in Holyoke have for years been governed by those prevailing at Springfield, Mass., where a new scale will be brought up for consideration on June 1, 1916. It was stated that the union has no objection to Attorney James E. Cotter, of Boston, who was recently appointed by Governor Walsh as the third member of the arbitration board. L. D. Pellissier, president of the Holyoke Street Railway, said that the agreement of Aug. 15, which was prepared just prior to the end of the last strike, provided that matters in dispute were to be submitted to the arbitration board. The company desired a three-year agreement to avoid a yearly discussion of working conditions, but was willing to submit the question to arbitration.

Soon after the stoppage of cars jitney service was inaugurated between points in Holyoke and the Brightside

district, reducing the rate from 25 cents as applied in the previous strike, to 10 and 15 cents. Extra car service was also run on the suburban line of the Boston & Maine Railroad out of Springfield to Connecticut Valley points north. After spasmodic efforts in various quarters to establish a basis for a settlement, Governor Walsh proffered his good offices in the case, and an informal conference was held on Wednesday to enable the facts and viewpoints to be presented to the chief executive of the commonwealth.

CLEVELAND COUNCIL MEETING

A Summary of Action Taken on Important Railway Matters Recently

By unanimous vote the City Council at Cleveland, Ohio, has agreed to submit the franchises granted the Cleveland & Youngstown Railroad and the Cleveland, Akron & Canton Terminal Railroad to a referendum vote on Nov. 2, the regular election date. Previous to the Council meeting Peter Witt, street railway commissioner, had expressed his purpose of opposing the Cleveland & Youngstown Railroad grant on the ground that the New York Central Railroad was heavily interested in it. Mr. Witt said he favored the improvements this company wished to make, but believed the railroads should agree to build a union station before a proposition was accepted by the city in which any or all of the companies were interested.

The Council has passed the long-pending ordinance giving the Cleveland Railway the right to build a line on 123rd and 125th Streets, connecting the Superior and St. Clair Avenue lines. This will furnish partial cross-town service in the extreme east end of the city and at the same time serve thirty-one streets that are remote from any of the present lines. Construction work on this line will probably be begun at once.

Councilman Meyers offered an amendment to the city traffic code which would limit the speed of street cars to 20 m.p.h. Mr. Witt opposed this, but offered to reduce the speed of cars in Mr. Meyers' ward to 20 m.p.h. if he desired the change. The offer was not accepted.

Councilman Moylan asked for a rearrangement of the schedules on Lorain Avenue on the ground that many of the motormen and conductors were compelled to be at the carhouses most of the day in order to secure a few hours' work. Mr. Witt also opposed this step.

Because of the opposition of Mayor Baker and Mr. Witt to the plan of requiring the Cleveland Railway to pay rent for the use of the proposed subways to the Superior Avenue bridge across the Cuyahoga River, the County Commissioners have agreed to enter into a contract with the company that it shall have the use of the subways free of rent as long as the Tayler grant with its municipal control provisions and 6 per cent dividend clauses are in effect. At a recent conference Mr. Witt contended that the patrons of the street railway would be paying this rental and that they are under no more obligation to do so than those who cross the bridge in carriages, automobiles and taxicabs.

TOLEDO FRANCHISE NOT TO BE INITIATED

Negotiations With the City Are Not to Be Resumed at the Present Time

After the special franchise committee of the City Council at Toledo, Ohio, makes a report of its work during the past year on Sept. 20, it will be discharged. This was agreed upon at a meeting of Council on Aug. 23. Several members opposed delay in discharging the committee and argued that no report is needed.

Councilman Dotson, a member of the committee, told the Council that the committee had done good work and had taken the only course that will ever result in municipal ownership of the street railways. This work might have proved very valuable, as a draft of a franchise had been formed, when negotiations were finally broken by Henry L. Doherty, who would not agree to the plan unless the committee would recommend that action be taken by Council on the draft. Mr. Dotson said that reports that negotiations had been conducted for the purpose of defeating municipal ownership of the road were false.

When Mr. Doherty was in Toledo on Aug. 26 to attend the farewell dinner to F. G. Berge, manager of the light and power department, he told the newspapers that no franchise would be initiated at once by the Toledo Railways & Light Company and that there was no intention of resuming negotiations with the City Council. Further than this he gave no details of plans for the future. Mr. Berge has been appointed chief engineer of the Doherty interests with headquarters in New York.

WASHINGTON POWER HEARING CONCLUDED

Hearings were held before the Public Service Commission of the District of Columbia on Aug. 26 and 27 to inquire into the intercorporate relations of the Washington Railway & Electric Company and the Potomac Electric Company with respect particularly to the terms under which the Potomac Electric Company furnishes power to the railway. Among the witnesses were Clarence P. King, president of the Washington Railway & Electric Company; William F. Ham, vice-president of that company, and L. E. Sinclair, superintendent of the Potomac Electric Company. A previous contract between the companies is said to have provided that the railway pay the power company 6 per cent interest on the value of the plant used in the production of power for railway service and a profit on such power as was used by the railway. Extension of the plant of the electric company being deemed advisable, the railway guaranteed the interest on certain improvement bonds of the electric company, and the power contract between the companies was accordingly modified. The railway load had enabled the power company to generate on a large scale and the cost of production had as a result been reduced more than half, while the number of consumers had increased from about 6000 to 20,000. The commission has taken the case under advisement.

As previously stated in the *ELECTRIC RAILWAY JOURNAL* E. W. Bemis is now engaged in appraising the public utility properties in the district. This work it is expected will be completed in November.

THE NEED FOR PUBLICITY

In an editorial, "Good-Will and the Public Utility," in a recent issue, *Printers' Ink* said in part:

"The position of a public service corporation has sometimes been characterized as 'between the devil and the deep sea'—with the Public Service Commission restricting its profits on the one hand, and on the other the pressing need to secure private capital for plant extension and betterments. But how often is the consuming public told those facts? How often is the man in the street taken to one side and shown in the spirit of reasonableness that the service he gets for his nickel or his dime or his dollar depends upon the ability of the company to find purchasers for its bonds? How often is he shown that there is a direct relationship between the good will the public bears to the company and the service the company is able to give the public? Not so often as might be.

"The railroads which serve the towns in Westchester County, New York, have spent in the last three years many thousands of dollars to fight a rate reduction ordered by the Public Service Commission. The Court of Appeals has finally declared that the order is unreasonable, and it shall not stand. The railroads won their case—but at what cost in counsel fees, rebate slips, contingent liability funds, and all the rest! That sort of drama is being enacted over and over again. Sometimes it is necessary. More often it is not.

"One-tenth of the cost of such a legal struggle invested in an advertising campaign of education (before, not after public opinion has been adversely aroused), would often obviate the necessity of spending the other nine-tenths. The public is not unreasonable; it is not hopelessly biased against the railroads or any public utility whatsoever; it is only ignorantly devoted to what it conceives to be its own interests. What the public needs is to be shown the facts, and the best way, and the only effective way, is through advertising. And there never was a better time than right now, while the public mind is beginning to react from its over-indulgence in corporation-baiting."

Amalgamated Convention in Rochester.—The Amalgamated Association of Street & Electric Railway Employees of America will hold its annual convention, beginning Sept. 13, 1915, at Convention Hall, South Clinton and Monroe Streets, Rochester, N. Y. The hotel headquarters will be Hotel Eggleston and the headquarters of the executive committee in the Reynolds Arcade, Rochester.

New Haven Authorizes \$600,000 Signal Expenditure.—The New York, New Haven & Hartford Railroad has authorized an expenditure of \$600,000 for the installation of automatic block signals on its line, four-track, from Stamford, Conn., westward to the New York Central connections at Woodlawn, New York City, 20 miles. The controlled manual block system is now in use on this part of the road.

Ottumwa Company Praised.—In an editorial in the issue of Aug. 25, the *Ottumwa Daily Review* said: "Ottumwa has a great street railway service. There is none that can compare with the Ottumwa convenience of street transportation in cities of this size and not entered by interurbans. Ottumwa is justly proud of the Byllesby Company (Ottumwa Railway & Light Company) and its traction identity with our people."

Water Power Bill and Land Leasing Recommended.—Passage of a general water-power bill and a measure to create a national leasing system for coal, oil and other resources on public lands will be recommended to Congress in the annual report of Secretary Lane of the Interior. Mr. Lane announced on Aug. 31 that he expected both measures would be enacted. They were passed by the House in the last Congress, but the Senate failed to act upon favorable reports of the bills.

West Penn Division Strike.—The West Penn Traction Company, Pittsburgh, Pa., is operating its Allegheny Valley Division, the trainmen on which went on strike recently. The officers of the company are reported to have told Patrick Gilday of the State Board of Arbitration that the company had nothing to offer the men and nothing to arbitrate, as the contract in force was understood by both the company and the men. Arrests have been made promptly following the recent isolated cases of disorder.

Restoring Service in Galveston.—The first street car service in Galveston, Tex., after the storm of Aug. 17 was resumed on Aug. 26 on several lines of the Galveston Electric Company. The power plant was ready for operation several days prior to that time but owing to the fire hazard the current was not turned on until the water main under the bay, which brings the city's supply from the mainland, could be repaired. Damaged motors is now the most serious obstacle to the rapid restoration of normal service. As fast as the cars can be repaired they are put into service.

City Engineer to Value Minneapolis Street Railway.—The City Council of Minneapolis, Minn., has instructed the city engineer to begin the valuation of the Minneapolis Street Railway as a step preliminary to negotiations for a renewal of franchise. The present franchise still has eight years to run. In general outline the plan proposed for renewal closely resembles the one which has been in operation in Cleveland for four years and is known as the "transportation at cost" plan. An outline of the proposal was contained in the *ELECTRIC RAILWAY JOURNAL* of July 24, page 161.

Bus Service to Tie Isolated Municipal Lines.—The public utilities committee of the City Council of Seattle, Wash., has recommended for passage by the Council, the bill authorizing the Board of Public Works to enter into a contract with F. M. Peterson for the operation of an automobile bus service between Thirteenth Avenue West and Nickerson Street, the north terminus of Division "A" of the Municipal Street Railway, and Ballard Avenue and Market Street. Mr. Peterson proposes to operate buses to connect with all the cars on the municipal line, and to receive 3 cents for each adult, and 1½ cents for each school child that he carries.

Services for Mr. Graham.—Funeral services over the remains of the late John R. Graham, president of the Bangor Railway & Electric Company, Bangor, Me., were held at Mr. Graham's late residence in Bangor on the afternoon of Aug. 26. As a mark of respect to the memory of the dead man, all electric cars on the system were stopped for five minutes. The burial was from Christ Episcopal

Church, Quincy, Mass., on Friday afternoon, where a large and representative attendance of public utility men expressed the desire of many workers within the electric railway and central station industries to pay their last respects to their distinguished friend and co-laborer.

Los Angeles Board to Urge Track Elevation.—The Los Angeles Public Utilities Commission has ordered the Pacific Electric Railway to show cause why it has not complied with the terms of a franchise granted more than a year ago for the construction of elevated tracks to San Pedro Street to minimize traffic congestion in the business district of Los Angeles. The franchise provided for the extension of the company's elevated tracks from the rear of the depot at Sixth and Main Streets to San Pedro Street, and the operation of all the cars of the company over these tracks. The franchise specified that construction should begin one year from the date of its approval, July 10, 1914. The company has three years in which to complete the work. The hearing was set for Sept. 2, 1915.

The Quarter-Century Span of the Electrical Industry.—The first annual outing of the Quarter Century Club of the General Electric Company factory at Schenectady, N. Y., to Lake George, Aug. 28, emphasized the fact that many of the members of the company have been connected with the company since the very beginning of the period of rapid development of the electrical industry, that is, in 1890. Two hundred and six of the 500 members of the Quarter Century Club made the excursion to Lake George. The average age of the members of the party was fifty-two years, the youngest member was thirty-eight and the oldest seventy-four. G. E. Emmons held the record for longest continuous service, thirty-four years. C. A. Coffin, chairman of the board, and President E. W. Rice, Jr., are both members of the Quarter Century Club.

Railway Mail Pay Facts.—Business men in every state are asked in a bulletin, "Railway Mail Pay and Public Opinion," to study the question and take it up with senators and congressmen. The document is published by the Railway Business Association, the national organization of manufacturing, mercantile and engineering concerns dealing with the railroads. The "space method" advocated by the Post-office Department is vigorously opposed. In ten years, according to this bulletin, the post-office receipts increased 100.5 per cent and total railway mail pay only 27.7 per cent. George A. Post, president of the association, says: "It is our earnest hope that the government which requires that rates of transportation to private shippers shall be reasonable and that practices of commercial corporations shall be fair, shall free its own procedure from all suspicion of unreasonableness and unfairness." The association urges that mail pay shall not again be made a rider on an appropriation bill or dealt with at the crowded end of a session.

PROGRAMS OF ASSOCIATION MEETINGS

Mississippi Electric Association

At a meeting of the executive committee of the Mississippi Electric Association, held in Jackson on Aug. 25, the tentative dates set for the Hattiesburg convention were Nov. 11 and 12. It was definitely decided that there would be no papers at the convention. The meeting will be given over to discussions of subjects to be of interest to all, as it is thought that by the elimination of long papers the convention could be made of much more general interest.

American Institute of Electrical Engineers

The Panama-Pacific Convention of the American Institute of Electrical Engineers will be held in San Francisco, Cal., on Sept. 16, 17 and 18. The hotel headquarters of the Institute will be at the St. Francis. The convention sessions will be held in the Native Sons of the Golden West Building. The papers of perhaps the most direct interest to the electric railway industry will be presented at the session devoted to the valuation of public utilities. There will be a symposium on inventories and appraisals of properties, Part I by C. L. Cary, Part II by W. G. Vincent and Part III by W. J. Norton. These papers will be supplemented at the session by contributions from other members of the committee on inventories and appraisals of properties.

Financial and Corporate

MILD OPTIMISM PERMISSIBLE

Electric Railways Have Felt Nation's Depression, but Present Improvement and Wider Appreciation of Utility Problems Cause Brighter Outlook

The record of 950.2 miles of track built or put in operation during 1912, 1018.9 miles in 1913 and 946.38 miles in 1914, and of 6001 cars purchased in 1912, 5514 cars in 1913 and 3010 cars in 1914 tends on close analysis of the details involved to confirm the general impression that the electric railway industry is not keeping so much abreast of the growth of the country as it did in preceding years. Without a doubt electric railways have felt the depressing influence of the nation-wide curtailment of business that has been evidenced with increasing force since the middle of 1913. Yet indications are not lacking that this condition will be mitigated in the future.

We cannot here make a composite analysis of all the factors involved in the present electric railway business situation, but a few points are worthy of note. Electric railway earnings for 1913 and 1914 as compared with steam railroad earnings, building permits, bank clearings, steel and iron production, agricultural products and the cotton crop, show the highest relative stability, and it is to be expected that under normal circumstances they would respond most quickly to the business rejuvenation that is now presaged by the increasingly favorable foreign trade balance, the lack of a marked tendency toward prohibitive prices for capital and the exceedingly propitious crop reports. The full response of electric railway earnings to these influences, however, is likely to be retarded by the factors peculiar to this industry, such as the special problems of rates, wages, regulation and now jitney competition.

While such special factors as these have a certain effect upon the relative stability of electric railway earnings, they influence more the relative profitability of the industry and are the more dangerous thereby. In spite of the stability of earnings, the problem of furnishing continually more and better service under constantly increasing costs at a depreciated rate of fare has in recent years become one of serious moment, but we believe that daily there is now growing a wider appreciation of the economic service performed by electric railways, their right to protection against unfair and unregulated competition of jitneys and their needs for successful operation. Various decisions, such as those in the Schenectady Railway, Manchester Street Railway, Middlesex & Boston Railway, Blue Hill Street Railway, and Eastern and Western rate cases, indicate that at last the courts, the commissioners and even the public seem to be taking a more rational view of the urgency of relief to common carriers.

In the present, therefore, we find a promise of improvement in regard to the special problems of electric railways. When this is considered in connection with the present propitiousness of general conditions there is warranted a letting up of pessimism and even a mild optimism in the electric railway field. The prospect should encourage purchasers, for in the shadow of the receding depression prices should be low, construction work cheap and long-time loans fairly moderate-priced.

DEPRECIATION ACCOUNTING POSTPONED

The California Railroad Commission in a supplemental opinion has ordered the United Railroads of San Francisco to begin the accumulation of its depreciation account as of July 1, 1915, and to continue it until \$1,650,000 is accumulated by June 30, 1918, this amount being the same as originally directed. This order virtually postpones the time for beginning the account by a year. The original order provided that the depreciation account should be established so as to show an appropriation from earnings of \$550,000 not later than June 30, 1915. This amount was to accrue in equal monthly installments of \$45,833. The company applied for a rehearing and directed the attention of the commission to various matters concerning its accounts. The commission now finds no merit in the contentions.

ANNUAL REPORTS

Brazilian Traction, Light & Power Company, Ltd.

The statement of income, profit and loss of the Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., for the year ended Dec. 31, 1914, follows:

Revenue from securities owned and under contracts with subsidiary companies	\$7,523,696
Interest on advances to subsidiary companies.....	535,117
	<u>\$8,058,813</u>
General and legal expenses, administration charges and interest on loans	392,281
Surplus available for dividends	<u>\$7,666,532</u>
Dividends on 6 per cent preference shares at 1½ per cent each	\$600,000
Dividends on common shares at 1½ per cent each....	6,257,119
	<u>\$6,857,119</u>
Surplus carried to profit and loss.....	\$809,413

The year's operations of this company, which includes among its controlled properties the Rio de Janeiro Tramway, Light & Power Company, Ltd., Rio de Janeiro, Brazil, and the Sao Paulo Tramway, Light & Power Company, Ltd., Sao Paulo, Brazil, were not so satisfactory as anticipated. As a result of the monetary stringency and other adverse conditions in Brazil, the factories began to run on short time or suspended business completely, and with the large number of employees thrown out of work, the earnings of the tramway systems were seriously affected. Notwithstanding such bad business conditions, however, the gross income of the combined companies in Brazilian currency showed an increase over the previous year, but the revenue in gold was unfavorably affected by the drop in exchange.

After payment of the regular dividend of 6 per cent per annum on the ordinary shares, a credit balance of \$3,822,410 was carried forward to the profit and loss account. In view of the serious financial conditions developing in Brazil, and later the much more serious financial situation throughout the world, all possible expenditures on capital account in connection with the development of the property were suspended, but there was a large amount of work under way which it was necessary for the different subsidiary companies to complete. A considerable amount of construction work had also to be carried out in order to comply with the obligations of the different concessions. The different companies performed all such necessary work, both for capital account and as regards maintenance and renewals.

One interesting practice during the year arose in connection with the effect of the European war in stopping the usual method of remittances by means of bills of exchange. For several months it was practically impossible to remit money from Brazil for the purpose of the payment of coupons and dividends, and as this situation did not improve, the board decided in October to remit its funds—which by that time had accumulated to a very large amount—in coffee. As the Rio de Janeiro company has under charter a fleet of steamers for transporting coal and other required materials, the board employed such steamers on their return journeys for freighting the coffee to the New York and European markets. Up to the end of the year there had been purchased and shipped from Rio de Janeiro and Santos 278,400 bags of coffee, all of which have since been disposed of in New York at prices materially in excess of the average exchange prices obtainable during the same period. The company now carries in its balance sheet coffee in store and in transit valued at \$2,810,215.

During the year a few of the outstanding shares of the Rio de Janeiro Tramway, Light & Power Company, Ltd., and the Sao Paulo Tramway, Light & Power Company, Ltd., were acquired, and a large controlling interest was secured in the Companhia Rede Telefonica Bragantina, a telephone company carrying on business throughout the State of Sao Paulo. This is said to be a very desirable acquisition, in view of the telephone business carried on by the Rio de Janeiro company.

According to a report for 1914 prepared by F. S. Pearson, the late president of the company, the only department of the Rio de Janeiro division which failed to show an increase of earnings in Brazilian currency was the tramways. There was little extension of the tramway lines, but during the

year thirty-two cars were completed and put into operation. The total passengers carried in 1914 were 192,103,645 as compared to 195,783,634 in 1913, while the car-miles totaled 24,815,078 in 1914 and 24,814,760 in 1913. In Sao Paulo a small trackage of 1.72 miles and four freight cars were added. The passenger total in 1914 was 53,732,292 as compared to 56,776,702 in 1913, with a car-mile record of 9,496,091 in 1914 and 9,344,880 in 1913.

General Gas & Electric Company

On account of the acquisition of the properties of the Atlantic Gas & Electric Company on April 29, 1915, the General Gas & Electric Company, New York, N. Y., has issued a comparative interim report showing the combined earnings of all controlled companies for the twelve months ended May 31, 1914, as follows:

	1915	1914	Percentage Increase
Operating revenues	\$2,260,171	\$2,132,422	6.0
Operating expenses and taxes.	1,462,246	1,361,120	7.4
Operating income	\$797,925	\$771,302	3.5
Other income	18,338	16,977	8.0
Gross income	\$816,263	\$788,279	3.5

This increase in income was produced in spite of extraordinary expenses necessarily attending a change of management, widespread business depression and, during last winter, exceptionally unsatisfactory conditions for the water-powers of the company, caused by an unprecedented drought now thoroughly broken.

The General Gas & Electric Company controls the Rutland Railway, Light & Power Company, Rutland, Vt., and the Northwestern Ohio Railway & Power Company, Toledo, Ohio, while the Atlantic Gas & Electric Company properties include no street railways. The proportion of street railway earnings to the total earnings has been reduced by the extension of control from 34½ per cent to less than 16 per cent.

During 1914 the cars of the Rutland Railway, Light & Power Company ran 610,388 car-miles and carried 2,877,235 passengers, these figures comparing with 551,855 car-miles and 2,976,692 passengers in 1913. The Northwestern Ohio Railway & Power Company carried 834,107 passengers in 1914 and 849,989 in 1913, while the car-miles operated in 1914 were 742,609 as compared to 735,771 in 1913.

Commonwealth Power, Railway & Light Company

The condensed comparative statement of income, profit and loss of the Commonwealth Power, Railway & Light Company, Grand Rapids, Mich., for the twelve months ended June 30, 1914 and 1915, follows:

	1915	1914
Earnings on stocks owned in subsidiary companies	\$2,382,175	\$2,463,861
Interest and other earnings	500,516	517,823
Gross earnings	<u>\$2,882,692</u>	<u>\$2,981,684</u>
Expenses and taxes	\$104,317	\$114,508
Interest charges	602,699	659,842
Total deductions	<u>\$707,016</u>	<u>\$774,350</u>
Net income available for dividends, replacements and depreciation	\$2,175,676	\$2,207,334
Dividends on preferred stock*.....	960,000	960,000
Balance	<u>\$1,215,676</u>	<u>\$1,247,334</u>

*Includes dividend requirement since May 1, 1913, on the \$10,000,000 of additional preferred stock issued as of that date.

During the last fiscal year the earnings on stocks decreased \$81,686 and the interest and other earnings \$17,306, giving a decrease of \$98,992 in gross earnings. Expenses and taxes, however, decreased \$10,192 and interest charges \$57,143, so that the net income available for dividends, replacements and depreciation decreased only \$31,657. Of the amounts standing to the credit of surplus accounts of subsidiary companies there are accruing to the holding company as of June 30, 1915, undistributed earnings of \$2,695,672.

Bay State Street Railway, Boston, Mass.—The Massachusetts Public Service Commission has granted its permission for the Bay State Street Railway to issue \$1,281,900 of 6 per cent cumulative first preferred stock at \$112 to provide for the company's floating debt.

Binghamton (N. Y.) Railway.—The Public Service Commission for the Second District of New York has authorized the Binghamton Railway to issue \$90,000 of equipment trust certificates, maturing serially in semi-annual periods and bearing 6 per cent interest. The proceeds will be used to purchase twenty new double-truck steel cars to cost \$118,503, the company paying \$28,503 in cash.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—On Aug. 24 Judge W. I. Grubb at Birmingham ordered a foreclosure sale of the Birmingham, Ensley & Bessemer Railroad. The amount due for principal and interest on the company's bonds is said to be \$2,831,230. Previous reference to the receivership of this company was made in the *ELECTRIC RAILWAY JOURNAL* of Sept. 19, 1914.

Boise Valley Traction Company, Boise, Idaho.—The Boise Valley Traction Company, recently incorporated in Maine with a capital stock of \$1,000,000, is said to be the holding company of the Idaho Traction Company properties in Boise, Caldwell, Nampa and other cities in western Idaho. It is expected that as soon as possible all of the properties of this company will be transferred to the Boise Valley Traction Company.

Burlington County Transit Company, Hainesport, N. J.—The total passenger receipts of the Burlington County Transit Company for the year ended June 30, 1915, were \$67,939 as compared to \$64,905 in the preceding year, an increase of \$3,034. Other income decreased from \$5,839 in 1914 to \$5,161 in 1915; while the expenses for operation, repairs and renewals were \$66,940 in 1915 and \$72,735 in 1914, a decrease of \$5,794. The balance on hand June 30, 1915, was \$7,284, of which \$5,000 was for the depreciation and surplus account and \$1,000 for tax reserve.

Cleveland (Ohio) Railway.—The operating report of the Cleveland Railway for July shows a deficit of \$17,531, the first deficit since the penny charge for transfers has been in effect. This reduces the interest fund to \$487,811. June, the first month that the company's increased operating allowance of 6 cents per car mile was in operation, showed a surplus of only \$2,939.

Halifax (N. S.) Electric Tramway, Ltd.—The total earnings of the Halifax Electric Tramway, Ltd., for the calendar year 1914 were \$645,241 as compared to \$605,933 in 1913. Of these totals street railway receipts made up \$319,880 in 1914 and \$301,771 in 1913. The operating expenses and taxes were \$375,123 in 1914 and \$337,010 in 1913, with bond interest \$30,000 each year, leaving net earnings applicable to dividends of \$239,818 in 1914 and \$238,924 in 1913. The number of passengers carried increased from 6,876,003 in 1913 to 7,316,727 in 1914, and the car-miles from 1,275,527 in 1913 to 1,370,430 in 1914. The expenditures for capital purposes during 1914 amounted to \$41,864. Dividend payments totaled \$112,000.

Interborough Rapid Transit Company, New York, N. Y.—The board of directors of the Interborough Rapid Transit Company has declared a quarterly dividend of 5 per cent, payable on Oct. 1, to stock of record on Sept. 22, making a total of 20 per cent for the fiscal year. This is equivalent to last year's payments, but in that year there were regular dividends of 10 per cent and two extra dividends of 5 per cent each. It is understood that the dividend hereafter will be on a regular 5 per cent quarterly basis. At the meeting of the board of the new Interborough Consolidated Corporation, the holding company for the subway corporation, a quarterly dividend of 1½ per cent on the preferred was declared, payable on Oct. 1 to stock of record on Sept. 10. This is the second quarterly dividend paid by the new company. The preferred stock of the old Interborough-Metropolitan Company still outstanding can share in the dividend.

Kansas City Railway & Light Company, Kansas City, Mo.—The managers of the Kansas City Railway & Light Company reorganization, noted in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21, have issued a statement regarding the new street railway franchise and the valuation and the earnings of the street railway and lighting properties in Kansas City. This statement gives a report on the earnings of the Metropolitan Street Railway, the Kansas City Elevated Railway and the Kansas City & Westport Belt

Railway, made by P. J. Kealy. The earnings of these railways for the fiscal year ended May 31, 1915, were \$6,805,163 as compared to \$6,974,815 for the preceding year. This decrease, less than 2.5 per cent, is said to be caused by the general industrial depression existing throughout the country, which affected all public utilities, and by the jitney competition. Such competition in Kansas City is rapidly disappearing and should affect the earnings slightly, if at all, during the remainder of the current year. Mr. Kealy says that the net earnings, after payment of operating expenses (including taxes, maintenance and renewals), will continue to be sufficient to pay 6 per cent on the capital value of the property, both in Missouri and Kansas, and leave a substantial surplus for the city under the new franchise.

Kentucky Traction & Terminal Company, Lexington, Ky.—The gross earnings of the Kentucky Traction & Terminal Company for the year ended June 30, 1915, were \$811,628 as compared to \$782,271 for the preceding year. Other figures of earnings follow: Net earnings—1915, \$379,225; 1914, \$369,762; other income—1915, \$28,288; 1914, \$32,022; bond interest—1915, \$203,805; 1914, 201,934; sinking fund and taxes—1915, \$33,424; 1914, \$43,249; surplus—1915, \$170,284; 1914, \$156,600.

Macon Railway & Light Company, Macon, Ga.—The Georgia Railroad Commission on Aug. 24 denied the petition of the Macon Railway & Light Company to increase its rates for electric light and power service in Macon. The commission calculated a return of 6.32 per cent on the estimated value of the property and working capital after the deduction of depreciation.

New York (N. Y.) Railways.—The directors of the New York Railways have taken action on the semi-annual interest on the 5 per cent adjustment income bonds for the six months ended June 30. It has not been announced what the statement of income submitted to the board showed available for the income bonds, because the matter has been referred to an arbitration committee for final adjustment. The men appointed as arbitrators are H. H. Porter, of Sanderson & Porter; James Marwick, of Marwick, Mitchell, Peat & Company, and W. G. Ross, of Montreal. This is the third time that this matter has gone to a board of arbitration. In the corresponding six months last year, 1.288 per cent was paid. It is reported that the amount for the first six months of 1915 may be in the neighborhood of 1.75 per cent.

Otsego & Herkimer Railroad, Cooperstown, N. Y.—Judge G. W. Ray on Aug. 21 in the United States District Court at Norwich appointed C. H. Lewis, Syracuse, and James J. Bayard, Cooperstown, as receivers of the Otsego & Herkimer Railroad. The appointment was made on the application of Babcock & Wilcox, Philadelphia, Pa., creditors. This company operates 65.66 miles of single track connecting Oneonta, Cooperstown, Richfield Springs, Mohawk and Herkimer.

Philadelphia & Western Railway, Upper Darby, Pa.—It is reported that almost the entire holdings of the Sheldon-Kobusch interests in the Philadelphia & Western Railway have been taken over by a syndicate which believes the company has a promising future. These holdings included originally all the \$2,000,000 of preferred stock and \$1,600,000 of the \$4,000,000 of common stock, being a majority of the total \$6,000,000 of stock issued. For some time there has been increased activity at advancing prices in the stock of this company. It is said that Edward B. Smith & Company and Brown Brothers & Company are interested.

Public Service Corporation of New Jersey, Newark, N. J.—The gross increase in total business of the Public Service Corporation of New Jersey for July was \$119,972, or an increase of 4 per cent. The balance available—after payment of operating expenses, fixed charges, sinking fund requirements, etc.—for amortization, dividends and surplus was \$267,201. The increase in surplus available for dividends over the corresponding period in 1914 was \$37,150. For the seven months ended July 31 the gross increase in total business was \$751,808, an increase of 3.7 per cent. The balance available for amortization, dividends and surplus was \$1,864,643. The increase in surplus available for dividends was \$186,746.

Winnipeg (Man.) Electric Railway.—The London Stock Exchange has listed an additional £400,000 of 4½ per cent perpetual consolidated debenture stock of the Winnipeg Electric Railway, making a total listed of £900,000.

DIVIDENDS DECLARED

Brooklyn (N. Y.) Rapid Transit Company, quarterly, 1½ per cent.

Connecticut Valley Street Railway, Greenfield, Mass., 3 per cent, preferred.

Frankford & Southwark Passenger Railway, Philadelphia, Pa., quarterly, \$4.50.

Second & Third Streets Passenger Railway, Philadelphia, Pa., quarterly, \$3.

Washington Railway & Electric Company, Washington, D. C., quarterly, 1¼ per cent, preferred; quarterly, 1¼ per cent, common.

JITNEY JOTTINGS

Public Service Commission of the District of Columbia Decides Buses Are Common Carriers

In the matter of the jurisdiction of the Public Utilities Commission of the District of Columbia over motor-bus lines and similar common carriers the commission on Aug. 28 issued the following order:

"Under authority of the law and regulations relating to street traffic in the District of Columbia and of licenses duly issued by the commissioners of the District of Columbia, certain persons, firms and corporations have undertaken the operation of motor buses and other motor vehicles along certain defined routes in the District of Columbia for the transportation of persons for hire.

"It now appears to the commission that the motor bus and motor vehicle service has become established as an important means of transportation to the public. The Public Utilities Law defines the term common carrier as follows:

"The term 'common carrier' when used in this section includes express companies and every corporation, street railroad corporation, company, association, joint-stock company or association, partnership, and person, their lessees, trustees, or receivers, appointed by any court whatsoever, owning, operating, controlling, or managing any agency or agencies for public use for the conveyance of persons or property within the District of Columbia for hire."

"The commission is of the opinion that this provision of law includes any person, firm or corporation operating any public motor-bus or motor vehicle for hire or for the transportation of passengers in the District of Columbia with sufficient regularity to enable the public to take passage therein at any point intermediate to the stable or stand of such vehicle or operating such vehicle over a route sufficiently definite to enable the public to ascertain the streets and avenues on which such vehicles can be found en route.

"In pursuance of this opinion and of all the facts developed the commission decides that the following named persons, firms or corporations, operating motor buses or motor vehicles over defined routes in the District of Columbia are engaged in the business of common carriers within the meaning of the Public Utilities Law and are therefore within the jurisdiction of the Public Utilities Commission: Arlington Barcroft Auto Company, Baltimore & Washington Boulevard Motor Company, Inc., Employees of Southern Railway at Potomac Yards, Va., Mrs. C. M. Singleton Jack, Jitney Bus Company, Inc., Thomas M. Nolan, Mrs. Agnes W. Maher, James M. Swain, Stein, Harris & Dulcan, Virginia Auto Service Company, Inc., and Selina M. Wright.

"It is therefore ordered:

"(1) That the above named individuals and corporations and such other individuals and corporations as now or may hereafter engage in the business of common carriers described above shall comply with all the requirements of the Public Utilities Law applicable to them.

"(2) On or before Sept. 10, 1915, the said persons shall submit the following reports: (a) A statement of the number of vehicles operated and the make, type and seating capacity of each vehicle so used. (b) A statement of the route or routes covered in each case. (c) A copy of the schedule on which the buses are operated.

"(3) That the said individuals and corporations shall submit such other reports, special or periodic, as may now or hereafter be required by law or by the orders of the Public Utilities Commission."

The first step in the new legal fight against the jitney ordinance in Philadelphia, Pa., was taken when counsel representing the South Philadelphia, the Philadelphia Jitney Associations and the Union Motor Bus Company filed a bill in Common Pleas Court No. 4 asking an injunction to restrain Director of Public Safety Porter and the Police Department from enforcing the jitney ordinance. If the jitney men succeed in getting a new injunction they will be able, they say, to furnish the \$2500 bond to keep it in

force. This they failed to do when Judge Sulzberger suspended enforcement of the ordinance until Sept. 20, resulting in the preliminary injunction being vacated by the court. City Solicitor Ryan has sent two opinions to Director of Public Safety Porter clearing up the legal status of two new matters the jitney situation has brought to light. These opinions, prepared at the request of the Department of Public Safety, established the following:

That motor companies which claim exemption from the requirements and restrictions of the July ordinance regulating the operation of jitneys, on the ground that they are running omnibuses and not jitneys, are subject to all the terms of the omnibus ordinance of 1907, and can be prosecuted for any violation thereof; that the operations of the Cottar Motor Bus Company, which runs four large cars in Germantown and other points, largely over routes not traversed by trolley or other transportation lines, are not in violation of any existing ordinances, and hence are not being favored, as some of the jitney men have charged.

The City Council of Camden, N. J., has received a communication from the granges at Moorestown, Medford and Marlton, N. J., protesting against conditions at the Pennsylvania Railroad ferries at Camden, due to the large number of jitneys that occupy the highways there. They say this congestion interferes with the teams on their way to Philadelphia markets. The communication has been referred to the Street Committee.

E. F. Seixas, general manager of the Niagara, St. Catharines & Toronto Railway, St. Catharines, Ont., Can., with lines from the north to the sound end of Niagara Falls, Ont., has filed a protest with the city authorities against the jitney service inaugurated over the same route by private individuals. The City Council is now preparing a jitney ordinance to deal with this new form of transportation.

An ordinance regulating the use of jitneys in Emporia, Kan., has been passed by the City Commissioners. The ordinance gives the city power to revoke drivers' permits if any provision is violated. The ordinance prohibits the drivers from smoking when carrying women passengers, from excessive overloading of cars, and permits may be revoked for drunkenness or for any misconduct that in the judgment of the commissioners renders the drivers unfit to operate a car.

An interesting turn has been given to the jitney in Elwood, Ind., where some drivers of jitney buses petitioned the City Council to fix an annual license fee for all drivers of jitneys, taxicabs or other vehicles for hire, and for placing each driver under a \$2,500 bond. This ordinance has been passed, with the support of the jitney operators, who, it is said, favored it because it will tend to lessen competition from farmers who come into town on Saturdays and hang jitney signs on their cars. Elwood is in Madison County, Indiana, on one of the electric railway lines.

Provisions of the city ordinances in pamphlet form as to operation of jitney buses are being distributed to jitney operators by the traffic police of Nashville, Tenn. A delegation of jitney owners which complained to Mayor Ewing was informed that the city could do nothing but enforce the law as it stood and that the owners should petition the city commission for such relief as they desired.

Jitney buses are on the decline in Louisville. One concern, which fitted up elaborate cars, appears to have quit operation as several of the cars have been hauling lumber. Louisville's Board of Public Safety has undertaken to determine whether such of the jitney buses as are in operation there are carrying more passengers than capacity. One provision of the ordinance which governs the operation of these carriers limits the number of passengers which may be carried to the seating accommodations. It is stated that the practice of overloading is common with the few machines still in the service.

E. W. Allen, Assistant Attorney General of the State of Washington, has ruled that a company which has written a bond for a jitney bus may be released from liability on the same terms and conditions as prescribed by law for the release of individual sureties upon any bond or undertaking. Should such bond be cancelled the permit of the jitney bus operator would be automatically revoked until a second bond has been filed.

INQUIRING INTO NIAGARA FALLS ACCIDENT

Nothing which would tend to show criminal negligence on the part of E. J. Dickson, vice-president of the International Railway Company, Buffalo, N. Y., was brought out on Sept. 1 at the first day's hearing before Magistrate Campbell in the Police Court at St. Catharines, Ont. Mr. Dickson is under bonds of \$10,000 charged with criminal negligence as the result of the fatal accident at Queenstown, Ont., on July 7. Mr. Dickson was represented by M. J. McCarram, St. Catharines, Ont., and Frederick A. Chormann, Niagara Falls, N. Y., of counsel for the railway. The prosecution was presented by Crown Attorney Michael Drennan of the Province of Ontario, Canada.

On the first day of the hearing about a score of witnesses were called, among them being members of the car crew and other motormen and conductors, who testified that the brakes on the car were in good working order on the day of the disaster and that the accident was due to slippery rails caused by the heavy rain and the overcrowded condition of the car. E. H. Henning, superintendent of interurban lines of the company, identified certain drawings of the scene of the wreck and the fatal curve. He said the car had been in constant use on the day of the accident and never before gave any trouble on the steep incline leading from Queenstown Heights to the lower level of the Niagara Gorge. He was asked if there was any device which might have been placed on the track at the dangerous curve which would have tended to lessen the danger from disaster in case a car left the tracks. He replied in the negative and explained that probably nothing could be done to check the speed of the car or prevent it from leaving the tracks if the motorman in charge had lost control. Replying to the question if there was a safety switch at the point in question, Mr. Henning said that because of the great speed of the car the chances are that the accident would still have happened even if a derail had been installed. Other witnesses who were called testified that the roadbed was in perfect condition at the point of the accident and that there were no apparent defects in the rails.

It was expected the hearing would continue for several days. The court has no jurisdiction to punish the defendant, but merely to decide whether or not there is sufficient evidence to show criminal negligence to hold Mr. Dickson for the grand jury.

On Sept. 3 Mr. Dickson was absolved from blame for the Queenstown accident by Magistrate Campbell.

Fare Increase Petition Withdrawn.—The Berkshire Street Railway, Pittsfield, Mass., has withdrawn its petition to the Public Service Commission of Massachusetts for permission to increase the fares on its system. According to C. Q. Richmond, general manager, the company is studying various electric railway fare systems and will ultimately file another petition.

Railway in Safety-First Exhibit at State Fair.—The Columbus Railway, Power & Light Company, Columbus, Ohio, is well represented in the safety-first exhibit at the Ohio State Fair. Among other things the company has on display a series of photographs, showing how easily injuries may be received in boarding and alighting from cars, in crossing the tracks both before and behind cars and in many other ways.

Night Freight Service in Cleveland.—The Cleveland, Southwestern & Columbus Railway, Cleveland, Ohio, is planning to begin hauling freight next spring in a limited way, under an ordinance passed on Dec. 9, 1912, in Cleveland, which allows freight cars to pass over the streets between the hours of 10 p. m. and 3 a. m. The service has not been established heretofore because of the financial depression which followed shortly after the ordinance was enacted.

Accident Responsibility in Fort Wayne.—According to a report of the safety-first committee of the Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., 50 per cent of all accidents are due to the negligence of the persons injured. During the last five months eighty-two persons have been injured in automobile accidents on the lines of the company. In forty-two of these cases the automobiles ran into the street cars and in forty cases the street cars ran into the automobiles.

New Seattle Publication Christened.—The Puget Sound Traction, Light & Power Company, Seattle, Wash., has announced that *Electrogram* has been selected from thousands of names submitted in a contest recently closed, to supplant the original title, *What's Its Name*, adopted temporarily for the new weekly publication of the company. As stated in the *ELECTRIC RAILWAY JOURNAL* of Aug. 28, page 371, the paper will be devoted largely to street railway news and general items of interest to the travelling public.

One-Man Cars in New Albany.—Inroads made on the company's earnings by the jitney buses in New Albany, Ind., are assigned by the Louisville & Northern Railway & Lighting Company as the reason for taking off the conductors on the cars of the Main Street line. Fare boxes have been restored to the forward ends of the cars as they were before the Insull interests took over the local property. The company hopes to be able to continue the conductors on the other lines of the city. At least thirty jitneys are operating in New Albany, a town of about 25,000.

The Augusta-Aiken Fare Increased.—According to the decree of the Railroad Commission of South Carolina, the order authorizing an increased passenger rate on the line of the Augusta-Aiken Railway & Electric Corporation between Augusta and Aiken was to become effective on Sept. 1. The order, increasing the fare between Augusta and Aiken from 25 cents to 40 cents was granted in December, 1914, by the Railroad Commission, and it was to go into effect on Jan. 1, 1915. However, a postponement was granted until June 1 and at that time the Railroad Commission ordered that the new rates be further postponed for three months—making Sept. 1 the date on which the order was to become effective.

Safety First at Kentucky State Fair.—The safety-first propaganda will be carried directly to the Kentucky people who attend the Kentucky State Fair during the middle of September by the Louisville Railway. The company will erect a signboard adjoining the pay-as-you-enter inclosure. The signboard, 6 ft. x 10 ft. in dimensions, will be illuminated with reflectored lights which will make it and its contents useful night and day, an important feature inasmuch as there are night sessions at the fair grounds. At the top of the board will be painted the two words, "Safety First," and underneath will be tacked the various poster cards which the company has been making use of for a year or more in its cars and elsewhere.

Suppressing the Rowdy in New York.—Chief Inspector Max Schmittberger has reported to Police Commissioner Woods of New York City regarding the arrests this summer of rowdies on the street, elevated and subway trains. The report shows an increase in the number of arrests over last summer, but it is pointed out that this is really due to the increase in the number of policemen engaged in suppressing rowdies. During the summer, up to Aug. 30, 1071 arrests were made for disorder in public conveyances, against 622 in 1914. In every inspection district there are now at least four men assigned to plain clothes duty on days when travel is heavy, to arrest disorderly persons. Inspector Schmittberger says that in connection with the efforts to suppress the rowdy, the magistrates are giving every support and rarely are prisoners discharged without a fine.

Retaliation Threatened in Boise.—The separation of the lines of the Boise Railroad and the Idaho Traction Company and the refusal of the Boise Railroad to honor transfers of the other company have resulted in complications which may be followed by resort to the courts. According to an opinion handed down by the assistant attorney general of the State there is no authority in the act creating the Public Utilities Commission for that body to compel the companies which have been segregated to honor transfers issued by each other. Despite this the chairman of the commission announced that he would entertain a complaint on behalf of the city. As a consequence the city officials have entered a complaint with the commission. Mayor Robinson is even reported to have said that if the city fails by this measure to secure the transfer privileges which it is set on exacting from the companies the city will as a last resort modify the stringent jitney ordinance passed some time ago and throw the city open to the jitney operators on a basis so liberal as to insure competition by jitneys with both companies.

Personal Mention

Mr. O. A. Waller has been appointed to succeed Mr. James L. Adams as superintendent of the North and East divisions of the Denver (Col.) Tramway.

Mr. U. E. Coons has succeeded Mr. A. E. Anderson as chief engineer of the power station of the Oskaloosa Traction & Light Company, Oskaloosa, Ia.

Mr. K. R. Hobbe has been elected secretary of the Centralia & Central City Traction Company, Centralia, Ill., to succeed Mr. John Langenfeld, who continues with the company as treasurer.

Mr. John C. Mac Bean, Philadelphia, Pa., has been elected president of the St. Petersburg & Gulf Railway, St. Petersburg, Pa., to succeed Mr. William C. McClure, Peoria, Ill., who has been elected vice-president.

Mr. A. C. Flint has been appointed superintendent of transportation of the Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio, to succeed the late J. C. Espy. Mr. Flint was formerly superintendent of the eastern division of the company, which office will probably be discontinued.

Mr. M. F. Flatley, formerly with the Empire United Railways, Inc., at Newark, N. Y., was recently appointed master mechanic of the Northwestern, Martinsville and Crawfordsville divisions of the Terre Haute, Indianapolis & Eastern Traction Company to succeed Mr. L. W. Hayes, now connected with the Mesaba Railway, Virginia, Minn.

Mr. John Fleming, storekeeper of the Capital Traction Company, Washington, D. C., since January, 1909, has been appointed purchasing agent of the company. Mr. Fleming was born in Reading, Pa., on Nov. 10, 1876. He attended the public schools in Philadelphia, Pa., and Washington, D. C., and entered the machine shop of the Capital Traction Company, then the Washington & Georgetown Railroad, in 1893. A year later he was transferred to the general offices as stenographer and clerk. In January, 1909, he was appointed storekeeper of the company.

Mr. Howard A. Loeb, chairman of the executive committee of the Pennsylvania Lighting Company, Shamokin, Pa., and of the Kentucky Traction & Terminal Company, Lexington, Ky., has been elected to the presidency of the Tradesmen's National Bank, Philadelphia, Pa., succeeding his father, the late August B. Loeb. The new president is only forty years old. After his graduation from the engineering department of the University of Pennsylvania, Mr. Loeb accepted a position with a contracting engineering firm. In 1907 he went to the Tradesmen's National Bank as vice-president.

Mr. James L. Adams, superintendent of the North and East divisions of the Denver (Col.) Tramway, has resigned to assume the vice-presidency and management of the Crown Hill Cemetery Association, which includes the Denver & Crown Hill Railway. Mr. Adams entered the employ of the Denver Tramway on June 15, 1890, as a clerk under Mr. John C. Curtis, then auditor. In 1893 he was appointed to a clerkship under the North division superintendent. From there he was transferred to the South division and thence to the West division. He then took charge of the clerical work at the East division carhouse. After spending some months at the East division, he was called to the auditing department, and became general timekeeper. Here he remained for three years, and until he was appointed superintendent of the West division. From December, 1900, to October, 1901, he continued in this capacity, when he was placed in charge of the East division. In November, 1902, Mr. Adams was transferred to the North division.

OBITUARY

Dr. Joseph J. Higgins, attending surgeon of Fordham Hospital and former surgeon of the Metropolitan Street Railway, New York, N. Y., is dead. Dr. Higgins was born in Terryville, Conn., in 1868.

Jacob G. Metcalfe, former president of the Mexican International Railway, a director of the London Underground Railway, London, England, and recently consulting railway expert for Speyer & Company, bankers, New York, died on Aug. 31 at Pocono Summit, Pa., in his sixty-seventh year.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

Nashville & Eastern Electric Railway, Nashville, Tenn.—Incorporated in Tennessee to construct a line from Lebanon to Smithville, via Watertown, Alexandria and Liberty, about 35 miles. It is reported that the Nashville, Chattanooga & St. Louis Railway will build the line. Capital stock, \$10,000. Incorporators: Charles Edwards, Dibrell Dinges, Guy Davis, G. C. Puckett and T. W. Wade. [Aug. 28, '15.]

FRANCHISES

Los Angeles, Cal.—A franchise for electric railway lines on San Pedro Street from Thirtieth Street to South Park Avenue, on South Park Avenue to Slauson Avenue and on South Park Avenue to Manchester Avenue will be offered for sale by the Council on Sept. 8.

Los Angeles, Cal.—The Pacific Electric Railway has asked the Council for a franchise to construct and operate a single-track line on certain portions of Figueroa Street, Denver Avenue, Hoover Street, Menlo Avenue and Vermont Avenue. The sale of this franchise has been advertised for Sept. 8.

Forest Park, Ill.—The village of Forest Park, Ill., acting under the commission form of government, has granted a franchise to the Chicago & West Towns Railway, subject to the approval of the voters at a special election to be held on Sept. 7. The franchise covers the streets which are in use by the company with the addition of Harlem Avenue between Madison and Sixteenth Streets. The franchise includes the usual paving requirements, and all new poles must be of iron and steel. No provision is made for a 5-cent fare beyond the limits of the company's own lines. A bond of \$50,000 is required of the company for its faithful execution of the franchise.

Lincoln, Ill.—The Council has set Sept. 21 as the date for a special election to submit to the voters the franchise for the Lincoln Railway & Heating Company.

Peoria, Ill.—The Peoria Railway has received a franchise from the Council to lay a double track on Frye Avenue from Wisconsin Street to Pacific Street, Peoria.

Shreveport, La.—The Shreveport Railways has received a franchise from the Council to double-track its Highland Avenue-Fair Grounds line from Marshall to Creswell Streets on Stoner Avenue and from Stoner Avenue to the end of the present double track on Herndon Avenue, Shreveport.

New Bedford, Mass.—The Board of Aldermen of New Bedford has adopted an order to revoke the franchise of the Union Street Railway to construct a railway on Union Street from Second Street to Front Street, New Bedford, on account of the failure of the company to construct and operate such railway. A public hearing on the revocation of the franchise will be held on Sept. 22.

Westfield, Mass.—The Springfield Street Railway has asked the Council for a franchise to relocate its tracks on Mill Street, Westfield, from West Silver Street to Court Street.

Buffalo, N. Y.—The Public Service Commission of the Second District has approved the franchise of the International Railway granting permission to lay tracks on Michigan Avenue and Ohio Street, Buffalo.

Columbus, N. Y.—The Columbus & Mayville Railroad has received a franchise from the Council to construct a railway through Columbus Township. This is part of a plan to build a line from Jamestown to Clymer. C. P. Northup, Corry, Pa., president. [May 1, '15.]

Linnton, Ore.—O. M. Clark and associates have received a franchise from the Council to operate electric passenger trains between Portland and Linnton on the St. Helen's road. [June 19, '15.]

TRACK AND ROADWAY

***Jasper, Ala.**—Plans are being considered to construct an interurban railway from Jasper to Birmingham, via Ensley, about 35 miles. L. B. Musgrove, Jasper, is interested.

Argenta (Ark.) Railway.—A notice of the surrender of its charter has been filed by this company in the office of the Secretary of State. The company has been consolidated with the Inter-City Terminal Railway, the incorporation of which was noted in the *ELECTRIC RAILWAY JOURNAL* of July 10. C. C. Kavanaugh, president.

Pacific Electric Railway, Los Angeles, Cal.—Plans are being considered by this company to build a loop line in Up-land. According to the plans, the line would start from the Mountain Avenue crossing of the San Bernardino-Los Angeles line extending north on Mountain Avenue to the San Antonio Park line.

Marin County Electric Railway, Mill Valley, Cal.—This company has filed with the California Railroad Commission an application for a supplementary order extending the time in which it may sell its stock until April 1, 1916. [July 17, '15.]

Connecticut Company, New Britain, Conn.—Work will be begun at once by this company on the construction of an extension through the northwest section of New Britain. All material for the construction has been ordered. The company will pave between the rails and 2 ft. outside with amiesite, except in Myrtle Street, which will be permanently paved next year.

Boise Valley Traction Company, Boise, Idaho.—The Boise Valley Traction Company, for which articles of incorporation were filed with the Secretary of State of Maine showing a capital stock of \$1,000,000 is reported to have been organized to be the holding company of the Idaho Traction Company properties in Boise, Caldwell, Nampa and other cities in western Idaho. Franklin B. Ferguson, Brooklyn, N. Y., president. [Aug. 28, '15.]

Alton, Granite & St. Louis Traction Company, Alton, Ill.—New ties and rails will be laid by this company on the south end of its Second Street line and new rails on the north end of the line, following the repairing and repaving of the street.

Lee County Electric Railway, Amboy, Ill.—This company plans to change the location of its tracks in Amboy and abandon its line on Main Street in favor of a line from Binghamton to Blackstone Street parallel to the tracks of the Burlington Railway & Light Company. This new line will give the company direct connection with both the Illinois Central Electric Railway and the Burlington Railway & Light Company.

East St. Louis & Suburban Railway, East St. Louis, Ill.—This company has been ordered by the Council of Belleville to raise its tracks on East B Street, North Charles Street and North Illinois Street and to replace its rails on West Main Street, Belleville.

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—This company is repairing its track on Columbia Street, Fort Wayne, between Clinton and Calhoun Streets. Cars are being routed on other streets while this work is in progress.

Terre Haute, Indianapolis & Eastern Traction Company, Indianapolis, Ind.—This company has asked the supervisors of Wayne County, Ind., to allow it the responsibility of building a temporary bridge at Main Street, Richmond, which will cost approximately \$6,500, the company to pay one-third of this amount.

Tri-City Railway, Davenport, Iowa.—Residents of Colona Avenue, Moline, Ill., have asked for an extension for that thoroughfare. A committee has been appointed to take up the matter with the railway company.

Cumberland Traction Company, Edmonton, Ky.—Cars which will operate on the line of this company, on which construction has been begun in Metcalfe County, Ky., will be of the motor-driven type, each generating its own electricity by means of an oil engine and a dynamo to supply the motors. The track, for a portion of the distance in Metcalfe County, will be laid in the center of the

Glasgow and Edmonton road, conditional rights-of-way having been granted by county officials, pending action of the Fiscal Court. The line will be of standard gage throughout and will connect Edmonton with one of the lines reaching down into that section. Though work has been begun, the definite route has not been determined for the whole distance and will, it is stated, depend upon the amount of stock subscribed by the sections through which various routes are projected. An engineer has been engaged to direct the operations which are being begun under L. J. Metcalfe, Elizabethtown, president. George H. Greenup, Elizabethtown, is vice-president and L. L. Greenup, secretary and treasurer. [Aug. 28, '15.]

New Orleans Railway & Light Company, New Orleans, La.—Residents of upper South Claiborne Avenue have presented a petition to the Council asking that the New Orleans Railway & Light Company be permitted to proceed with the extension of the South Claiborne Avenue line from Broadway Street to Carrollton Avenue, New Orleans.

Bay State Street Railway, Boston, Mass.—The Massachusetts Highway Commission has issued an order approving the new location and relocation of the tracks of the company in Washington Street, from Hanover Street to Lloyd Street, Lynn, and the relocation of the tracks of the company in Myrtle Street at Parker's turnout, Winter Street at Willis Street and Howard Street at Penny's turnout, Saugus.

Boston & Worcester Street Railway, Boston, Mass.—Work has been begun by this company relaying rails and ties on Mechanic Street, Marlboro. The present 60-lb. rail is being replaced with 75-lb. rail.

Massachusetts Northeastern Street Railway, Haverhill, Mass.—Work has been begun by this company repairing its tracks on Plum Island.

Worcester (Mass.) Consolidated Street Railway.—This company is repairing its roadbed on Cameron Street, Clinton. The company is replacing its ties and installing new rail joints.

Detroit, Almont & Northern Railway, Detroit, Mich.—A meeting has been held by Yale and Sandusky business men to urge the extension of this company's lines to these two cities.

Twin City Rapid Transit Company, Minneapolis, Minn.—Work has been begun on the construction of this company's extension of the Snelling-Minnehaha line to the new Twin City motor speedway.

St. Paul Southern Electric Railway, St. Paul, Minn.—Operation has been begun by this company from Hastings through the business district of St. Paul. The cars run over the lines of the St. Paul City Railway inside the city limits of St. Paul.

Springfield (Mo.) Traction Company.—This company has ordered 176 tons of 60-lb. rail to be used on the relaying of its track on Booneville Street. An additional order provides for the installation of new joints. It is stated that the new track will cost approximately \$60,000. The company expects to have the track laid by Oct. 1.

Public Service Railway, Newark, N. J.—Work has been begun by this company on the construction of a 1½-mile extension to Carteret. The American Bridge Company has received a contract for a 700-ft. viaduct in connection with this work.

Salem-Pennsgrove Traction Company, Salem, N. J.—It is expected that the necessary funds to build this proposed electric railway between Salem and Pennsgrove will be obtained within a short time and work begun at once. While the du Pont Powder Company will not build the road, a number of the individual members of the company will take stock in the concern and it will be controlled by these men and merchants and business people in Salem. It is believed that the line, which will be 13 miles long, will carry considerable freight. Arthur B. Smith, Salem, is interested. [Aug. 28, '15.]

International Railway, Buffalo, N. Y.—E. G. Connette, president of this company, announces that the directors of the system have decided to provide trolley service along Bailey Avenue on the east side. Tracks will be laid for part of the distance next year. The company has a franchise

in the street and a year's extension was granted by the last Legislature.

Jamestown, Westfield & Northwestern Traction Company, Jamestown, N. Y.—This company has been ordered to remove the tracks on West Eighth Street across Fairmount Avenue, Jamestown. This track was laid by the Chautauqua Lake Railroad Company twenty-three years ago for temporary purposes to obtain materials for constructing that line.

Interborough Rapid Transit Company, New York, N. Y.—The contract for the construction of Section No. 2 of Route 29, the Nostrand Avenue branch of the Eastern Parkway subway in Brooklyn, has been awarded to the Dock Contractor Company, New York, for \$1,692,371.

Durham (N. C.) Traction Company.—This company's extension on Holloway Street, Durham, has been practically completed and it is expected that cars will soon be operating on the new line.

Goldsboro (N. C.) Street Railway.—Plans are under consideration by this company for the extension of its line from Goldsboro to Seven Springs.

South Fork-Portage Railway, Johnstown, Pa.—Work has been begun on the construction of this company's line from South Fork to Portage, 7 miles. The road has been graded almost the entire distance, rails are being laid at several places along the line and the work of constructing bridges at various points along the right-of-way is now in progress. Robert Pearce, Portage, president. [May 15, '15.]

Shenandoah, Frackville & Pottsville Railway, Pottsville, Pa.—Considerable progress has been made on this company's line to connect St. Clair and Frackville. Over half of the line has been graded and the largest part of it has been completed with the exception of building several concrete bridges. It is expected that the road will be completed this fall. [Aug. 7, '15.]

*Brownsville, Tex.—It is reported that upon the subscription and guarantee of a bonus of \$75,000 by Brownsville citizens, A. A. Browne, president, and J. A. Browne, vice-president, Rio Grande Railway Company, have agreed to standard-gage its line from Brownsville to Point Isabel, 22 miles. It is also planned to connect the Brownsville Street Railway with this interurban railway.

Houston, Richmond & Western Traction Company, Houston, Tex.—The board of directors of the San Antonio Chamber of Commerce has indorsed a proposition for the construction of an interurban railway between San Antonio and Houston, Tex. The proposition was laid before the Chamber of Commerce by E. Kennedy, president of the Houston, Richmond & Western Traction Company on Aug. 26, asking for the indorsement of that body. The existing charter of the company, Mr. Kennedy said, would be amended to include San Antonio and the capital stock increased to \$250,000. [Aug. 28, '15.]

Lynchburg Traction & Light Company, Lynchburg, Va.—Construction has been practically completed on this company's extension from the Fair Grounds to Fort Hill and it is expected that cars will soon be placed in operation.

Seattle-Tacoma Short Line, Seattle, Wash.—Owing to the failure of the promoters to complete this line, for which a franchise was granted to Merle J. Wightman and C. E. Muckler in 1907, the city of Seattle may attempt to forfeit three deposits, aggregating \$13,500, made by the promoters. Some work was done on the proposed line several years ago but the promoters have not complied with the provision that the line be completed within a certain time. The franchise covers Fourth Avenue and Fourth Avenue South from Jefferson Street to Spokane Street, Seattle.

SHOPS AND BUILDINGS

Pekin (Ill.) Municipal Railway.—The City Council has awarded the contract for the erection of the new carhouse at Glenwood Avenue in the Rosedale addition to Pekin to Fred Helfenstein for \$1,796, and work will be begun at once.

New York, N. Y.—The contract for the construction of station finish on Section 2 of Routes Nos. 36 and 37, the Astoria elevated railroad in Queens, has been awarded by the Public Service Commission for the First District of New York to Charles Meads & Company, New York.

Manufactures and Supplies

ROLLING STOCK

City Railway, Pekin, Ill., just received three new cars which will soon be placed in service.

Cleveland (Ohio) Railway has submitted a request to the City Council for authority to purchase eighty cars of the front-entrance, center exit type.

Interborough Rapid Transit Company, New York, N. Y., has been authorized by the Public Service Commission of the First District of New York to use on its elevated lines the 478 composite car bodies ordered by the commission to be withdrawn from service in the subway. The car bodies with new trucks and electrical equipment will be placed in service on the Second and Third Avenue lines of the elevated system, now being third-tracked and reinforced.

TRADE NOTES

M. B. Chase, formerly New York manager of the Sangamo Electric Company, will represent the Stuart-Howland Company, Boston, in the New England territory.

Cincinnati (Ohio) Car Company writes that the weight of 16,800 lb., given for the Marshall (Tex.) steel car in the issue of July 10, pages 72-73, is for the car without electrical equipment. With electrical equipment the weight is 23,885 lb.

Westinghouse Electric & Manufacturing Company, Westinghouse Machine Company and Westinghouse Lamp Company announce the removal of their Chicago offices to the twenty-first floor of the Conway Building, Clark and Washington streets.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, has received an order for sixteen SE-95 "Golden Glow" headlights from the Granite City Railway Company, St. Cloud, Minn., which makes a complete equipment for the cars on this property.

Hoeschen Manufacturing Company, Omaha, Neb., maker of highway crossing alarms, has recently been reorganized and has moved its factory and office into larger quarters with the Paxton & Vierling Iron Works, at Seventeenth Street and Union Pacific tracks. This change has greatly increased the capacity of the factory and will facilitate the handling of future orders. F. K. Davis, until recently office engineer in the signal department of the Grand Trunk at Montreal, has been appointed general manager, with headquarters at Omaha.

Fibre Conduit Company, Orangeburg, N. Y., has recently received through its New England representatives, S. B. Condit, Jr., & Company, Boston, Mass., orders for the following conduit installations: Worcester (Mass.) Consolidated Street Railway, 150,000 ft. of 3½-in. socket joint; Manchester (N. H.) Traction Company, 210,000 ft. of 3½-in. Harrington joint; Hartford Electric Light Company, Dutch Point, Hartford, Conn., for feeders and interior work, 20,000 ft. of 3½-in. Harrington joint; Charlestown Gas & Electric Company, Charlestown, Mass., for underground service, 20,000 ft. of 3½-in. Harrington joint, and Bangor Railway & Electric Company, Bangor, Me., 3200 ft. of 3-in. Harrington joint.

ADVERTISING LITERATURE

General Electric Company, Schenectady, N. Y., has issued "Novalux Street Lighting Units for Mazda Series Lamps" and "Constant Current Transformers for Mazda Street Lighting Systems."

Trussed Concrete Steel Company, Youngstown, Ohio, has issued a folder describing its line of products, including Hy-Rib, Rib lath, Diamond lath, pressed steel studs, corner beads and base screeds, for roof sidings, partitions, ceilings, interior and exterior plastering, stucco, etc.

Hubbard & Company, Pittsburgh, Pa., have issued a folder describing and illustrating their new product, the Peirce "presteel" bracket. The company announces that the entire line of Peirce channel steel brackets will be duplicated in the "presteel" construction as soon as the dies can be produced.

General Bakelite Company, New York, N. Y., has issued a booklet, "Oxybenzylmethylenglycolanhydride, or Modern Magic," dealing with the production of Bakelite. The publication is 6 in. wide by 3 in. high and halftones are used to illustrate some of the many uses to which Bakelite is being put, among them for electrical instrument covers, terminal blocks, commutators and armatures.

NEW PUBLICATIONS

Purchasing. By C. S. Rindfoos. McGraw-Hill Book Company, New York, N. Y. 165 pages. Cloth, \$2.

Electric railway purchasing agents should find in this volume a store of valuable and useful information. While the examples cited and the forms exhibited do not often apply with much force to electric carriers, the principles underlying all are clear and are applicable to purchasing in this field. Important chapters deal with the questions of how to obtain the right article, the lowest price, prompt delivery and favorable terms, and with the subjects of personal qualifications, strategy and departmental organization. Of particular value is the chapter on the legal aspects of purchasing, for it outlines lucidly and succinctly the fundamental legal principles with which all purchasing agents should be familiar, but which for lack of legal training they too often know only in a haphazard way. The author has not done wisely in omitting or treating only briefly the allied subjects of advertising, accounting, traffic and stockroom management. The importance of these subjects in modern purchasing certainly makes them rank far above the question of a separate company for purchasing, on which subject we suspect the writer has an ax to grind. Still the book has a good feature in its being the first extended work in the field, if one can make himself oblivious to the overweening egotism of the author.

Public Utilities—Their Fair Present Value and Return. By Hammond V. Hayes. D. Van Nostrand Company, New York, N. Y. 207 pages. Cloth, \$2.

This valuable and comprehensive treatise is a companion to the author's "Public Utilities—Their Cost New and Depreciation," which deals with the methods to be used in appraisals and the general principles underlying the determination of fair present value as enunciated by courts and commissions. The present volume takes up the question of rates, fair value and fair return, and discusses the relation that should exist between public utilities and their patrons. Mr. Hayes states that the mutual obligations of these two parties have been recognized only during recent years, but that it is time for the radicals of each side to give way for a settlement of valuation controversies.

The most general conclusion that Mr. Hayes draws is to the effect that the fair present value must be measured, as far as is possible, by the actual investment made in good faith in property useful to the public. He notes, however, that the ascertainment of this fair present value is complicated by the necessity of finding such a value at the present time for new as well as for old enterprises. When he first suggests in the case of the old companies a compromise value established by investigation as a basis for the future, he seems to be avoiding the real obstacle in finding a suitable valuation method, for only in the case of the old companies now being first considered is there great difficulty in making valuations satisfactory to both parties. Yet later he explains fully the problems that arise in connection with the application of clear-cut methods of valuation to old enterprises of various types, and one of the chief merits of the book is the earnest and impartial effort to show how rigid valuation methods must be reconciled in some details to particular cases in order fairly to satisfy the mutuality of interests concerned.

Besides the discussions on the above-mentioned topics, Mr. Hayes presents two valuable chapters—one on going value, in which he explains an interesting method of calculation and argues for the grouping of preliminary or promotion expenses, costs connected with the physical property and going value, instead of simply using percentages of physical costs; and the other on depreciation, in which he presents a critical discussion of the need of annual reserves for renewals with the best accounting methods therefor. The book is readable and thorough—a sane analysis of existing theory in a vexatious field.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.

Consolidation of STREET RAILWAY JOURNAL JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, SEPTEMBER 11, 1915

No. 11

SIGNIFICANT MASSACHUSETTS FARE CASE

Although the action of the Bay State Street Railway in seeking to establish a 6-cent fare unit with some modification, on its system of nearly 1000 miles of track in eastern New England was foreshadowed at the close of the arbitration proceedings last June, resulting as they did in a substantial increase in wages, the conduct of the case before the Massachusetts Public Service Commission will be followed with special interest. The system is one of the largest in the world under a single management, in point of mileage of track, perhaps the largest outside of the Chicago surface lines, but more than this, it is headed by one of the foremost authorities in the industry on electric railway economics. This means that the company's case will be presented in a way which will leave little to be desired in breadth, thoroughness and insight. The form of the notification to the Public Service Commission is an earnest of this. In filing its intention to increase fares the company presented a complete tabulation of the existing and proposed rates in different portions of its territory, with complete computations of the resulting cost of transportation per mile for the distances involved, for every part of the system. The growth of the system from many smaller roads has necessarily created inequalities in fares and transfer arrangements which the company now desires so far as possible to equalize in seeking an approach to a fair return on its investment. It ought to be encouraging to the company that since the memorable Lexington & Boston decision of last year, the commission has shown itself disposed to grant some measure of relief in every case where a street railway has demonstrated its need of additional revenue and the soundness of its management.

WHEEL DIAMETER AND MOTOR HEATING

A very interesting and profitable discussion of the subject of the effects of difference in wheel diameter on motor heating has been going on in our columns for some time. The contributions to this discussion have brought out clearly the fundamental principles involved and have indicated the conditions under which overheating from this cause may be expected. While each article published has added something either from theory or practice, or both, the editors felt that if the data necessary for estimating approximately the heating to be expected in any practical case could be put into form for rapid use they would be appreciated. Accordingly W. A. Broomall, who has made an extended theoretical and practical study of the subject, and who is the author of the article published in the issue of the ELECTRIC RAILWAY JOURNAL for July 10, page 70, was

asked to extend the calculations upon which the earlier article was based. He has done so, and the results are given elsewhere in this issue. By plotting the results of numerous calculations in the form of percentage curves Mr. Broomall has made it possible quickly to estimate the effects of any difference in diameter of wheels of any diameter, both within the range of practice. This has been done by assuming average characteristic curves which fit all motors with sufficient exactness for practical purposes. It is obviously impossible to make a simple set of curves which will show the average heating with different schedule speeds, because a given schedule speed can be produced by a great variety in method of handling motors with consequent variety in heating effects. The best that can be done is to furnish information as to the inter-relation of the directly dependent variables as has been done in this case. That is to say, heating depends upon core loss and copper loss which, in turn, depend upon current and speed. Speed and current are, of course, closely related at a given line voltage. Then if the increased heating due to difference in wheel diameter at any speed can be estimated quickly, it is a simple process to calculate the average increase for the varying speeds involved in an actual speed schedule.

CITY SERVICE FOR VILLAGE TRAFFIC

A correspondent, in commenting upon the difficulties which beset the street railway that tries to operate profitably in a small city and to please the public at the same time, cites a case wherein a ten-minute headway was established in a town of 35,000 inhabitants. Obviously enough, this resulted in earnings of only 15 cents per car-mile, for the city was by no means sufficiently large to support the service. But when the headway was increased to a point more nearly commensurate with the needs of the community a perfect cyclone of opposition arose, notwithstanding the fact that adjacent cities of very much greater size were satisfied with a service that was no more frequent. Of course, the case is not at all unusual. The fact that a community is small does not necessarily deprive it of metropolitan ideals, and unfortunately, these ideals are quite often put into effect only to the extent of hounding the local railway into providing a city service for a village traffic. However, it should not be difficult for the officials of small cities to see that a frequent service cannot be maintained in the face of insufficient receipts, and the fact that they do not seem to see it leads inevitably to the conclusion that much of the trouble stirred up in cities that have just outgrown villagehood originates through motives that are not altogether

straightforward. Certainly, earnings of only 15 cents per car-mile will involve a loss for anyone except a miracle worker, and where such conditions exist it would even seem advisable to publish a detailed list of operating expenses, including in each item the proper proportion of the overhead charges of rent, taxes and interest, as is done in machine-shop accounting. This would at least make some hard questions for peanut politicians to answer, for after all, the general public at heart is essentially fair-minded.

ASSESSING BY COMMISSIONS?

Mr. Fletcher in his recent address before the National Tax Association convention, abstracted elsewhere in this issue, raised a taxation question that should be of interest to electric railways—namely, should public utilities be assessed for taxation by public service commissions? Mr. Fletcher feels that as rate and tax problems both require expert analysis of facts and the same set of facts must be used for both rate and tax purposes, the same expert body could well determine both issues. We do not favor such a proposal, for various reasons.

In the first place, although both rate and tax questions require expert analysis of about the same facts, the valuations determined for the two purposes are not equal. Rates are largely based upon the fair value of the property, while taxes are assessed on what is taken out as income. As Mr. Fletcher wisely points out, one is an investment value and the other an income or market value. The theory and practice of making valuations for rate-making purposes, however, are not sufficiently clarified and standardized for public service commissions yet to be burdened with the task of finding distinct rate and tax valuations. In the press of work the too likely tendency would be to use one valuation figure for both purposes, to the detriment of each.

Furthermore, utilities would be unfairly taxed as compared to other properties, unless the entire assessing power of the state were placed in the commission's hands. In most cases, however, the volume of work would make this impossible. There might be two commissions, one the public service body to assess utilities and the other a state tax commission to accept the former's valuations and itself to assess all non-utility property, but such a division of labor with work piled on the public service commission outside its real field would not be advantageous. Aside from the undesirability of having the public service commission attempt to make separate rate and tax valuations, there would be the difficulty of getting the state tax commission to adjust the assessed values of non-utility property to the returns of the public service commission, without being acquainted with the data upon which the latter's tax valuations would be based.

What is really needed for equitable taxation is not the loading of assessment work on already laboring public service commissions, but rather the appointment of a centralized state board that will fix the assessed valuations of all classes of property after care-

ful and impartial scientific investigation. If public service commissions have useful data, such can easily be secured and the tax and rate issues thus kept from clouding each other. If any reform is needed, it is in leading public service commissions more adequately to recognize taxes in rates, as they are reluctant to do now, and in securing higher non-utility taxation. Complete and adequate valuation of general property, on as strict a basis as in the case of utility property, is needed—not merely assessment of lands and town lots, but assessment of goods, merchandise and other forms of personal property, of manufacturing establishments and of natural resource companies. More particularly, in the local transportation field, all jitneys, automobiles and the like should be assessed according to their use of the highways and required to pay proportionate parts of all paving and similar taxes.

Whenever any statement is made concerning the unwarranted increase in utility taxes, the plea is generally made that if certain forms of taxation are discontinued, not enough funds will be secured to conduct the public business. What such pleaders fail to realize is that utilities are as willing to contribute to public revenues as are other corporations and individuals, but they object to paying more than their share. All they desire is an equitable division of the tax burden, and all their opponents wish, evidently, is to keep from under their proper portion as long as it is possible for them to do so.

MODERN CLAIM WORK SUCCEEDS

It has been said that the modern business man is a true heir to the old magician, for everything he touches seems to increase tenfold or a hundredfold in value and usefulness. One would have to go far in the electric railway field to find a more striking proof of this statement than the development of the claim department of the Pittsburgh Railways under Cecil G. Rice, described in the issue of July 24 and also in the present issue.

The first article was useful as showing how under Mr. Rice's guiding hand the department with its five bureaus had taken on the most modern form of organization, the co-operatively-functional type, but the present one is just as worthy in view of its delineation of practical business psychology and personal efficiency ideals in claim work. The thoroughness with which the management has analyzed and developed the routine work of the bureaus is fully equaled by the assiduity with which special psychological and efficiency methods have been utilized to bring the department to newer and wider horizons of activity and success. The specific organization and methods employed in Pittsburgh may not be susceptible of exact duplication by many other companies, particularly as regards the matters of size and detail, but the fundamental principles underlying the development of the Pittsburgh department can and should be applied by every claim official in the electric railway field.

Probably, we are sorry to say, there are some claim

agents and company officials who will look upon the joining of business organization and psychology with claim work as utter nonsense, for the old "strong-arm" concept of claim agents has not altogether been destroyed. Where modern theory and practice have failed to convince, however, perhaps results will succeed. A decrease of 50 per cent in suits pending, a drop of \$2,168,866 in the amounts sued for in suits pending, the settlement in one case of ninety-six injuries and in another of ninety-two injuries without the entrance of a single suit, and the decrease of \$140,000 during the last year in all expenditures properly chargeable to the injuries and damages account—these are the results of the application of modern business principles to the work of settling claims. They cannot be secured by the old rough-and-ready methods, and the sooner all claim agents realize this the better.

CULTIVATING PERSPECTIVE IN ROLLING-STOCK MAINTENANCE

The technical graduate entering the repair shop or starting in carhouse pit work this autumn is not likely to suffer from insufficient opportunity to master equipment details. He is more likely to be overwhelmed with these than otherwise. If, however, he cultivates a sense of perspective which differentiates tasks of vital importance, when considered from the standpoint of operating safety, from those of less consequence to the traveling public, he will gain much. In every profession the ability to grasp important matters and concentrate attention upon these is something worth seeking with hard labor, and the man who has much to do with the complex equipment of street railroading must learn to separate the essential from the incidental before he can market his judgment most effectively.

Without advising new men to neglect any opportunities to learn the details of rolling stock which come before them, we believe that the extreme importance of putting forth every possible effort to master the lessons of accidents may be emphasized. Often the man fresh from the engineering school goes into the shop with little realization of the part accident prevention work is playing to-day in the industry. He knows, doubtless, that "safety first" has become the slogan of progressive concerns from Maine to California, but his interest in the scientific principles underlying the design and operation of equipment has been so highly stimulated by his college course that to a large extent the tasks before him seem of equal significance. Such a man is likely, when noting a passing car, to observe peculiarities of its truck design or of its lighting arrangements, while perhaps failing entirely to appreciate its passenger load or the lack of it or to think about the relation of vestibule width and step heights to facility of handling traffic. He should not be blamed for overlooking what might be called the transportation side of car equipment through his interest in its physical structure thus early in his career, but with experience and well-directed thought the broader outlook can be cultivated.

All the work of the shop is naturally important in

relation to the service of the road, but it is worth unusual effort to take a specialized interest in the defects and failures of wheels, axles, brake rigging, the results of collisions, ability of equipment parts to withstand derailment shocks and lessons of accidents in which step arrangements play a part, as well as in the methods used to put rolling stock through the shop as quickly as possible after accidents. Few people outside the mechanical department realize the interest such studies inspire in the men responsible for the condition of the equipment to prevent the occurrence of like difficulties in the future. The practice of collecting photographs and sketches of equipment injured in various ways on the road is a good one for the young engineer. To the man of keen insight and broad judgment the repair shop becomes a sort of mechanical clinic, and by putting forth his utmost endeavors to learn everything possible about maintenance problems directly associated with the safety of the service, he can acquire a sort of mental set which is bound to be a factor in his success as a genuinely qualified railroad man.

THE FUTURE FOR ELECTRIC RAILWAYS

Of late the remark has been frequently heard—generally from the proponents of the motor bus—that the electric railway has reached its maximum of efficiency. Presumably, this means that further progress is an impossibility, and we are expected to believe that the cost of passenger transportation by electricity is never going to be less than it is to-day. In view of the fact that the unit revenue is certainly not increasing because of fare limitations, the outlook would be hardly encouraging if one accepted the doctrine of present perfection. However, we rather incline to the belief that electric railway operation is just about as subject to improvements in the way of better economy now as it was ten years ago. In the transportation department alone, for example, the field of opportunity for economy seems constantly to broaden, as we consider the possibilities.

It is only yesterday that such opportunities for saving as better popular education in accident prevention, the use of power consumption recorders and scientific fare collection have come to be generally accepted, and even along these lines there remains much untilled ground. Indeed, the matter of increasing the schedule speed without increasing the maximum speed—one of the most important considerations in economical operation—has never yet received any attention that is really worthy of the name, with the result that 8 m.p.h. is an almost universal figure, although the practicability of 10 m.p.h. and over has been demonstrated by a few shining examples. Such an increase, if made by cutting out stops, would alone mean a reduction in operating expenses of some 15 per cent, and until this and the numerous other possible economies have been thoroughly exploited it seems rather futile to accuse the electric railway business of being ready to succumb to the competition of the bus merely because this is alleged to offer such glittering possibilities of future improvement.

Chicago Elevated First-Aid System

In His Third and Concluding Article the Author Describes the Organization and Equipment of a Complete First-Aid System, and the Method of Maintaining It.

BY H. E. FISHER, M.D., SURGEON ELEVATED RAILROADS OF CHICAGO, ILL.

Two years' experience with a completely equipped and organized first-aid system on the Elevated Railroads of Chicago has demonstrated, beyond doubt, that the installation was warranted and fulfills a purpose much needed on transportation systems. Regardless of the safety-first measures which may be adopted, transportation lines are certain to have accidents in which either the public or the employees are injured. To meet these emergencies in a competent manner when they occur, it is essential that suitable medical and physical equipment be provided and that intelligent first-aid to the injured be administered promptly.

The results obtained by the Elevated Railroads of Chicago show that the installation of a hundred of these first-aid stations was more than justified. This number provides complete first-aid outfits at sufficiently frequent intervals over the entire property to make them convenient for all purposes. It has been found particularly desirable that all transfer stations, shops, towers, yards, junction points, terminals and substations be supplied with this first-aid equipment.

Each first-aid station is designated by a large red cross on a white background, placed in a prominent place on the sides of the towers and shops and at the ends of station platforms, the object being to make them visible from all directions on the elevated structure. These markers indicate to the employees that they can find medical and surgical aid for injuries and sickness. One of these first-aid outfits is shown in an accompanying illustration. Employees are required to memorize the locations of the first-aid stations which they may have occasion to use, so that when an accident occurs little or no time will be lost in securing first-aid material. Each of these stations is in charge of a man who is competent to render intelligent first-aid treatment, and he performs this service in addition to his regular

railroad duties. To fit these men for this work the company surgeon instructs them from time to time so that with the two years' experience most of them have become very proficient in this line of work.

FIRST-AID STATION EQUIPMENT

All first-aid stations are equipped with regulation United States army stretchers which, on account of their simplicity of construction and ease of portability, have been found to be the most practical for railroad use. With the patient on this stretcher it can be so manipulated that it may be carried up and down stairs without discomfort to the injured person. Moreover, it is readily handled by two men and can be conveniently taken into the cars through the windows or doors without disturbing the patient. Aside from these advantages the stretchers cost nothing to maintain and are easily kept clean, and the brown canvas does not show stains or grease marks. The leg rests enable the stretchers to be quickly converted into cots, thus rendering it unnecessary to lay the patient on the ground. For this reason, also, injured people who are transported in the cars do not complain of the vibration of the train, with its accompanying pain to the injured parts. Each stretcher is folded when not in use and hung on brackets on the walls of the first-aid stations.

At all first-aid stations are located the elevated railroad standard white-enameled first-aid boxes, 3½ in. x 9½ in. x 9 in. in size, and fitted with racks to hold the bottles of drugs and solutions. A set of first-aid rules is pasted on the inside of the cover of each box. The contents of one of these forms is reproduced in the illustrations. Posters showing the method of performing artificial respiration are also prominently displayed at the first-aid stations in all shops, yards, terminals and trainrooms.

The contents of one of these first-aid boxes comprises the following articles: One large, sanitary, white por-

[EDITOR'S NOTE. For preceding articles in this series see issues of June 26 and Aug. 7.]

CHICAGO ELEVATED—VIEW OF STANDARD FIRST-AID BOX, SMALL BOX AND CONTENTS OF EACH

celain dish, 7 in. x 10 in. x 2 in. in size, which is used to wash the hands of the employee giving first aid or to prepare the solution for treating burns; one pair of surgical scissors, 5 in. long; one medicine dropper for injecting eye drops into eyes injured by electrical flashes or burns or to allay eye irritation due to foreign matter; one small bottle containing sanitary tooth picks with cotton wrapped on one end, used in the application of iodine to cuts. Formerly camel's air brushes were used for this purpose, but they were found too expensive. They become easily soiled and are liable to carry infection into the wound when used more than once. The brushes also were misplaced and the bristles soon became stiff. The tooth-pick applicators are cheap and after being used are thrown away. The remainder of the equipment includes one yard of 1-in. tape used as tourniquet in case of bleeding; one reel of adhesive plaster, $\frac{1}{2}$ in. wide and 5 yd. long; one bar of germicidal soap used to wash the hands of those giving aid; one tube of vaseline used for burns on the face; 2 yd. of sterile gauze in a sanitary carton for wounds and burn dressings, two 2-ounce cartons of sterile cotton; $\frac{1}{2}$ lb. of cotton for reinforcing burn dressings; four each of 1-in., 2-in. and 3-in. gauze bandages; a 2-oz. bottle of tincture of iodine which is applied to all cuts or lacerations; 2 ounces of aromatic spirits of ammonia used in stimulating patients in shocks, unconscious or fainting attacks; 2 ounces of boracic acid eye drops; one pint glass jar each of raw linseed oil and lime water, and one empty pint glass jar used in mixing equal parts of lime water and linseed oil to make carron oil for burns.

Carron oil has often been criticised by the medical profession because it is greasy and unsterile and because it becomes rancid, but it is successfully used by the Elevated Railroads of Chicago for treating burns. Hundreds of burn cases have been treated, and we have not yet encountered infection from its use. Carron oil is made fresh each time it is needed and in sufficient amounts to treat the case at hand. No mixed portions of carron oil are left in the first-aid boxes, consequently we have not experienced the disadvantages claimed for this drug by others. Iodine also will give some trouble unless properly handled. The bottle should have a rubber cork because iodine will cause an ordinary cork to deteriorate. This is usually followed by escaping fumes which cause the metal of the first-aid box and scissors to corrode. As an extra precaution in this respect all lost or broken scissors have been replaced with new ones with painted handles which iodine will not attack.

A first-aid manual is placed in each box as an additional guide and ready reference to the employees in giving treatment. Supplies removed from the boxes in treating injuries are replaced by new material immediately so that the outfit is always complete. A card is placed in each box upon which is recorded the date the box was used, the injury necessitating it and the supplies used from it. One of the cards containing a record of one of the first-aid stations is illustrated. It will be noted that each employee having occasion to use the first-aid box gives his name, occupation, the kind of injury and the character of surgical treatment. From these record cards the efficiency of each box is determined. These first-aid stations are regularly examined by a medical department inspector who records the date and his name on the inspection label on the lid of the box.

Experience has shown that the secret of an efficient first-aid system is to lay down a set of rules to govern the system and to see that they are closely observed. If at the time of inspection any box is found in a dirty or neglected condition and with supplies missing, the man in charge is reprimanded and warned that a second

CHICAGO ELEVATED—EQUIPMENT OF EACH FIRST-AID STATION

occurrence will merit severe measures. At the time the first-aid boxes were installed the movement was not taken seriously by some of the employees. After a brief experience with these equipments in time of injury, however, their great value was demonstrated and the movement soon won the hearty support of every employee.

A small cedarwood first-aid kit for use where the larger kit is not desired is shown in one of the accompanying illustrations. This box contains 1 ounce of iodine, 1 ounce of spirits of ammonia, one tube of vaseline, one first-aid package of sterile gauze and triangular bandages, one pair of scissors, one bottle of cotton applicators, one 3-in. bandage, one 2-in. bandage, one 1-in. bandage and one box of sterile absorbent cotton. This small kit is for use in various departments of the shop in addition to the larger first-aid box. In the shops and substations wall cabinets are also used to accommodate

CHICAGO ELEVATED—DEMONSTRATION SQUAD AT WORK

the larger quantity of supplies necessary on account of more frequent injuries. A tin first-aid box has been provided at all first-aid stations because it can be taken to the patient, thus hastening the treatment.

The stretchers cost from \$4 to \$6 each, the large first-aid boxes \$4 to \$5 each and the small first-aid kits from \$2 to \$3, depending on the quantity of supplies they contain.

RESULTS OF FIRST-AID WORK

The results from the use of these first-aid equipments have been most gratifying. During the past two years there has not been one fatality due to wound infection as against two before the outfits were installed. In this same period only one case required hospital treatment of an infected shop wound. This case was a new man who did not think his injury was of any consequence and did not use the first-aid treatment. He remained in the hospital five days. Time lost by employees from shop wound infections has been entirely eliminated, and of the numerous cases of shop injuries where the iodine treatment has been used, only 1 per cent have resulted in infections, and these were of a very minor nature. All employees are urged and advised to seek first-aid treatment for all injuries regardless of how trivial they may appear. Close adherence to this custom accounts for the practical eliminating of infections from shop wounds.

Besides being of service to the employees these first-aid equipments have been a wonderful help in ministering to passengers of the elevated railroad. Scarcely a day passes that some box is not used for treating fainting or sick passengers. It seems that women passengers who are inclined to faint, know just where these stations are located, or at least the stations have been happily selected because women invariably faint near them. Aromatic spirits of ammonia serve in cases of this kind. The author has equipped several other street railways with these first-aid outfits and has advised and superintended the organization of their first-aid systems. Re-

ports from these companies indicate results equal to those experienced on the Elevated Railroads of Chicago.

ORGANIZATION OF FIRST-AID INSTRUCTION

After the first-aid equipment is installed it is very important to instruct the employees how and when to use it. If a means of educating the employees regarding the method of rendering first aid is not afforded, the installation is quite certain to prove a failure. An inexperienced man would not be asked to operate a delicate piece of electrical machinery without first being instructed. Lack of instruction in first-aid work is certain to produce just as harmful results, consequently it is vitally important that when these equipments are put into the employees' hands careful instruction is given. Officials of several outside companies have asked how such excellent results in first-aid work were secured on the elevated railroads when their employees would not use the first-aid equipments nor could the employees be interested in the merits of the plan. Inquiry revealed that these companies had installed good first-aid equipment but had failed to instruct their employees how to use them. As a result the employees thought the first-aid outfits were only ornamental and were afraid to use the supplies because they did not know how to go about giving first aid.

The plan of procedure developed for instructing employees has proved entirely satisfactory and will assure success to any other railroad that follows the same system. Owing to the large number of employees it was considered impractical to instruct all of them in a thorough manner, hence the medical department selected six extra trainmen, because they could devote time to the training course without interfering with their regular work. These six men were paid regular wages and received a course of instruction in rendering first aid to the injured. This instruction lasted two hours a day for a period of six weeks. The employees received personal instruction and training under the company surgeon, and when they had become proficient in the work they were called the first-aid demonstration squad. This squad in turn demonstrated first-aid work and instructed other employees in the art. This demonstration squad is shown at work in one of the accompanying illustrations.

Emergency squads of seven men each were then selected by the various heads of departments, and one squad was placed at each terminal, yard and shop on all branches of the elevated railroads. Five of the men selected for each squad were day men and the other

DIRECTIONS FOR EMERGENCY TREATMENT OF ACCIDENTS

GENERAL INSTRUCTIONS: Before touching burns, wounds, or skin abrasions, the emergency man must wash his hands thoroughly with the blue germicidal soap which is in the emergency outfit.

BURNS: Mix equal parts of linseed oil and lime water in empty Mason jar. Shake well and apply freely to injured part, cover with sterilized gauze and apply bandage.

BLEEDING: When there is bleeding from legs or arms, apply wide piece of tape tightly above the injury and leave in position until the doctor arrives, or patient is taken to the hospital. In case the bleeding is at a place where you cannot apply tape, cleanse the wound with tincture of iodine, apply sterilized gauze and bandage tightly.

WOUNDS AND BRUISES: Paint wound and surrounding skin with tincture of iodine, allow it to dry and cover with sterilized gauze. Cover with adhesive plaster or bandage.

FAINING: Place patient on the back, loosen clothes and give plenty of fresh air. Do not give any medicine except on doctor's advice as all cases of unconsciousness are not produced by heart weakness.

BROKEN BONES—FRACTURES: Fold two or three newspapers together and bind them snugly with a bandage around the broken member. If the legs are injured do not allow the patient to walk.

SHOCK FROM ELECTRICITY: Place in reclining position. Administer one-half teaspoonful of aromatic spirits of ammonia in one-third glass of water.

CONTENTS OF EMERGENCY BOXES

- | | |
|---|--|
| 2 ounces tincture of iodine. | 2 1-ounce packages Bauer & Black cotton. |
| 16 ounces lime water, in Mason jar | 3 3-inch bandages. |
| 16 ounces linseed oil, in Mason jar | 4 2-inch bandages. |
| 1 tube vasoline. | 1 ounce aromatic spirits of ammonia. |
| 1 3-yard package sterilized gauze—Burroughs & Welcomes. | 1 ounce eye water. |
| 1 bar germicidal soap—McClintocks. | 1 package zinc oxide 1/4-inch adhesive plaster |
| | 2 feet linen tape, 1 1/2-inch. |

UTENSILS FOR EMERGENCY BOXES

- | | |
|---|------------------------|
| 1 porcelain dish. | 1 pair small scissors. |
| 1 wide mouth Mason jar for mixing lime water and linseed oil. | |

Box and utensils must be kept in a clean and sanitary condition. When box is used see that supplies are ordered promptly to keep full supply at all times.

CHICAGO ELEVATED—RECORD CARD OF FIRST-AID STATION, SHOWING ASSISTANCE RENDERED BY STATION EMPLOYEES

two were night men, so that at least one or two men of each squad would always be present at these various locations and could competently render first aid. These emergency squads were made up of shop foremen, yard foremen, dispatchers, switchmen and other men who had been in the service for a number of years, hence could be relied upon at all times. Moreover, the selection of men of this caliber assured intelligent work and the greatest efficiency.

The company surgeon, with the aid of the demonstration squad, instructed by lecture and demonstration these emergency squads until they in turn were able to administer intelligent first-aid treatment. During the period of instruction these men received their regular pay and accordingly were interested and supported the work. These emergency squads were taught how to bandage wounds, dress lacerations and burns, treat unconscious and fainting cases, perform artificial respiration in cases of electrical shock, give emergency treatment for broken legs or arms, treat heat prostration cases, apply tourniquets in cases of bleeding and give competent surgical service in the case of many other forms of injuries that might occur. The employees comprising these teams entered into the work with much enthusiasm. Their support of the movement and their good work have been instrumental in saving the lives and allaying pain in time of accident of many of their brother employees. To the efforts of these squads also may be attributed the great decrease in the number of infections and the reduction of the period of convalescence of injured employees.

As a text and reference for employees' use in time of injury, a small first-aid manual was compiled. This was written devoid of all technical and medical words so that it could be easily understood. Each employee of the elevated railroad received one of these booklets and was urged to study it. The value of the booklet has since been made evident by the great demand for it by other railroads, manufacturing companies, physicians and the public. A large number of these booklets have been distributed gratis to all who have asked for them.

Mass or group lectures and demonstrations in first-aid work were also conducted, and employees were assembled in classes of twenty or thirty and lectured for

two hours. These lectures met with a hearty response from all the employees, and at the meetings many valuable suggestions were received from them. More than 480 employees of the elevated railroads have received this course of first-aid instruction. When one stops to think what this means in time of accident it will be readily seen what great good is being accomplished. The traveling public is appreciative of this humanitarian work, particularly when, as injured passengers, they receive the benefit of the ministrations of these trained employees.

All the demonstrations are made as nearly as possible like the conditions obtaining at the time of an injury, so that the drill team can give realistic portrayals of the various injuries and the method of caring for them. Some of the supplementary instructions are illustrated by lantern slides, posters and charts. In the first-aid demonstration work the employees are taught how to render first aid for the most common injuries with surgical equipment and ideal surroundings, and also when there is nothing to be had but their own clothing. Considerable publicity has been obtained through the work of this department. The lectures by the company surgeon and demonstrations by the drill team have been given during the past year at private clubs, church societies and public meetings. In one or two instances the drill team has been used to instruct the employees on other electric railways. Beginning last May, the same course of instructions in first-aid work was extended to the old employees as well as the new men entering the service. These courses take the form of quizzes and illustrated lectures.

EXAMPLES OF FIRST-AID TREATMENT

To illustrate some of the benefits derived from this work a few examples of where lives were saved by employees' first aid are given. Many employees have had occasion to apply their knowledge of first-aid work in injuries to members of their own household. In one case an employee, following the knowledge imparted to him, saved the life of a member of his family who was bleeding to death from a severed artery. A conspicuous example of what good can be accomplished by properly instructed employees is shown in the following: An employee fell across the live third rail and was shocked

to unconsciousness. His heart had practically stopped beating, no pulse beats could be detected, all respiration had ceased and the man was apparently dead. The emergency squad at the yard where this accident occurred quickly released him from the electric circuit and resorted at once to artificial respiration. After an hour's unceasing work the squad was repaid for its efforts when the victim began to breathe. The squad then intelligently dressed the burns on his face and arms, and after a brief period in the hospital the injured employee returned to his regular duties in first-class physical condition. It is easy to see in this case what would have been the result if the squad had not been versed in rendering first aid.

Another illustration is a case where a man who had a leg cut off under the wheels of a car received first-aid treatment by employees. They applied emergency tourniquets to stop the bleeding and removed him to a comfortable position four and one-half minutes after the leg was cut off. The surgeon who responded in this case wrote a letter complimenting the employees who gave the first aid, and credited them with prolonging the man's life by the efficient manner in which they applied the tourniquet. Many other examples of the results of this work could be cited, but suffice it to say that the employees have received indorsements from many physicians and surgeons who have seen the results of their first-aid work.

Nothing is more distressing than first-aid given by a man who has not been trained in the work. His efforts frequently cause more infections than cures. Some of the bungling first-aid work done by untrained employees has caused prominent surgeons to discourage the use of first-aid equipment. On the other hand, the medical profession is quick to realize the good to be derived from first aid when the employees have been properly trained.

In closing, I will say that while this work is in its infancy in this country, there will come a time when it will receive greater consideration. The humanitarian nature of first aid to the injured appeals to every man, because every man owes to his fellow men a duty to perfect himself in methods of rendering first aid in time of injury. There is nothing more deplorable, nor a sight more pitiful, than to see a man seriously injured lying prostrate on the ground surrounded by a group of big, strong men who are helpless to aid the sufferer because they do not know what to do or are afraid to give aid for fear it might be wrong. Therefore, I say educate and train your employees in rendering first aid, and the time and money invested in the work will be returned a hundredfold.

Meeting of Public Service Association of Virginia

The annual meeting of the Public Service Association of Virginia, which includes in its membership the principal street railway, the electric light and power and the gas and water companies of Virginia, was held at Natural Bridge, Va., on Thursday, Aug. 19. Two-thirds of the member companies of the association were represented, and the usual routine business of the association was conducted. No formal papers were read, but topics of interest to the association were presented and discussed.

The officers elected for the ensuing year are as follows: President, E. M. Funkhouser, Roanoke, Va.; first vice-president, J. F. Rison, Danville, Va.; second vice-president, W. G. Matthews, Clifton Forge, Va.; third vice-president, Thomas S. Wheelwright, Richmond, Va.; secretary and treasurer, W. J. Kehl, Richmond, Va.

Operation by Signals on Baltimore & Ohio

This Line Is Successfully Operating Mixed Traffic Over Single Track Without Train Orders, a Manual Check on Signal Operation Being Provided

During the past year the Baltimore & Ohio Railroad has had in operation a 23.5-mile section of main-line single track wherein the traffic is controlled by signal indication alone. This section, which lies between La Paz Junction and Milford Junction in Indiana, couples double-track sections of the main line, but has not been double-tracked itself because of topographical difficulties. Acting, as it has, as a "neck of the bottle" for a frequent and heavy train service, the operation of this section by signal indication only has been a most important step, and the installation has been stated by F. P. Patenall, signal engineer, Baltimore & Ohio Railroad, to have effected the saving of much delay through the elimination of the necessity for issuing train orders.

The single-track section in question is divided into three parts by two passing sidings located at the intermediate stations of Bremen and Napanee, and at each of these points is an electro-mechanical interlocking machine with sixteen mechanical levers and sixteen power levers, thus providing for the operation of all switches at the station from a centralized point. At the stations at the ends of the single track section, La Paz and Milford, are interlocking plants that serve foreign railroad crossings as well as the needs of traffic from the double-tracked main line on to the single-track section and vice versa. Between passing sidings the single track is protected by three-position, Union Switch & Signal Company's style T automatic signals spaced at intervals of approximately $1\frac{1}{4}$ miles, these giving protection with stop and caution indications for following movements as in double-track operation. Normally these are in stop position, the signals for only one direction being cleared when a train is to be moved over the single-track section.

For opposing train movements protection is afforded by the use of a traffic-directional scheme whereby opposing signals cannot be cleared simultaneously and under which there is imposed the necessity for simultaneous action on the part of the operators at the stations at each end of the opposing block before a train can be advanced into it. The arrangement may be explained in brief by reference to the accompanying partial diagram of the locking circuit between Milford and Napanee, the operation in this case being typical of that of the other parts of the single-track section. In the interlocking machines at each of these two stations there is installed a traffic-direction lever, whose locking circuit is controlled by a push button at the opposite station, and the controlling relays for the intermediate signals obtain energy only when one of these two levers is in normal position and the other one is reversed. When both levers are in normal position or when both of them are in reversed position the circuits in both directions will be open and all signals will indicate stop.

Both levers are held in normal position by locks whose locking wire is controlled by the above-mentioned push buttons, as well as by all intermediate track-circuit relays, by all signals, both east-bound and west-bound, and by the traffic-direction levers themselves (both levers must be in normal position before current can be given to unlock either one). The locking between signals 27 and 29 east of Milford Junction and signals 16 and 18 just west of Napanee, for example, is effective through traffic control levers A and B in the interlocking machines, respectively, at each of the two towns named. Each of these levers is locked in normal position only, and the locking circuit governing them for

a train movement from Napanee to Milford may be traced as follows: From battery at Milford through back contact of a traffic-direction relay (which is in series with the lock for lever A but which is not energized in this operation); through push button at Milford (when this is depressed by the operator upon telephone advice from Napanee); through lever A, normal; through lightning arrester, etc.; thence breaking through all track relays and through all signals (in the stop position only) and then into the interlocking tower at Napanee. In the tower the circuit continues through various relays to traffic lever B, normal; thence through push button (which is not depressed); through coils of lock relay for traffic lever B and to the common return wire.

The energizing of this lock relay permits traffic lever B to be reversed, and this in turn permits the semi-automatic signals 16 or 18 east of Napanee to be cleared, allowing the train to enter the block. On the other hand, in case it is desired to run a train west-bound from Milford, the operator at Napanee must (upon advice from Milford) push the button at his station to complete the circuit that unlocks lever A at Milford, and this permits signals 27 or 29 to be cleared.

The levers A and B serve to release the mechanical locking in their respective machines, thus permitting the reversal of signal levers to cause proceed indications for the signals which govern movements to the single-track between stations. They serve also as controlling levers for all signals governing into or through the block in an assigned direction. For example, when it is desired to cause signal 18 to indicate proceed for an east-bound train at Napanee, the operator at Milford must give release by pressing a push button that unlocks lever B at Napanee, as previously outlined, and the operator at Napanee must accept the release by unlocking and reversing lever B at the same time. A simple combination of signal controlling circuits through lever A normal at Milford and B reversed at Napanee completes a series of line relays which are located at each of the intermediate west-bound signals 20-26 together with one in the tower at Napanee.

When the relays at intermediate signals are energized they cause the respective signals to indicate proceed, and the series relay in Napanee tower likewise controls signals 16 or 18 when the respective levers of those signals are reversed. Notwithstanding the fact that either of these levers may be reversed whenever lever B is reversed, signals 16 or 18 will not clear unless the controlling circuits are effective through the combinations above mentioned.

Throughout the installation the passing sidings are track-circuited, so that when a passing siding is occupied by a train nothing but the low-speed permissive signal can be used to advance a following train into the

OPERATION BY SIGNAL INDICATION—PARTIAL DIAGRAM OF LOCKING CIRCUIT

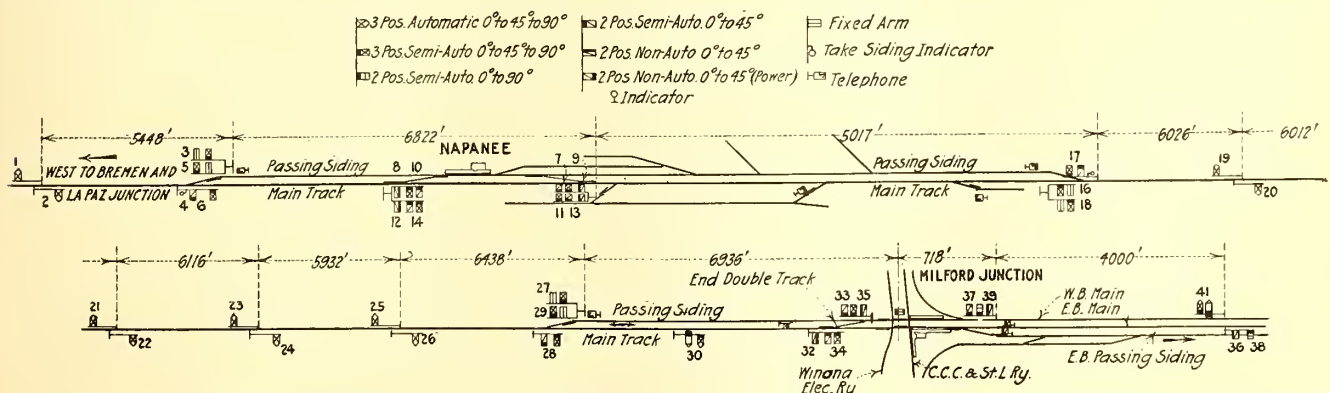

siding at the interlocking plant entrances. The low-speed signals and take-siding indicators are not semi-automatic and consequently can be used to transmit instructions to trains even though the tracks are occupied.

Take-siding indicators are installed on the rear home block signal masts for both east-bound and west-bound movements at Napanee and at Bremen. With the exception of these and the above-mentioned low-speed signals all signals are semi-automatic in their operation and assume the stop position in the rear of the train.

Intercommunication between the stations is established by means of the telegraph and a combination circuit for telephone and tap bells, both of these being used over the same wire. Telephones for the use of trainmen are located at the outer ends of passing sidings and at the facing switches which are not within convenient distance of the offices. Trains leaving outer ends of passing sidings first obtain permission to move by telephone, and when taking the sidings, report themselves in the clear.

A notable feature in this territory is the absence of separate train order signals, these having been eliminated in accordance with the company's standard practice because of their tendency to produce complex signal indications. If it should become necessary to issue instructions to trainmen at a station, the home interlocking signals are retained in the stop position and a red flag by day and a red lamp at night are displayed. This system of signaling, it may be said, is quite similar to that installed in 1912 between Germantown and Washington Junction, Md., on the Baltimore & Ohio Railroad, the trains being operated entirely under signal indication in both territories. The cost of the more recent installation was approximately \$2,700 per mile, of which about \$500 was for labor. The cost per signal, including interlocking, was roughly \$1,000.

A Swiss journalist says the streets of Belgrade are practically deserted, the city looking as if visited by a plague. Street car tracks are rusting away, the parks ruined, shops and houses deserted, and the university building and king's palace almost wrecked by shells.

OPERATION BY SIGNAL INDICATION—TYPICAL SIGNAL ARRANGEMENT USED BETWEEN PASSING SIDINGS ON THE BALTIMORE & OHIO RAILROAD FOR ELIMINATING TRAIN ORDERS

Pittsburgh Railways Claim Department

Description of Application of Psychological Principles and Personal Efficiency Ideals to the Work of Handling Claim Employees and Settling Claims—General Results of Pittsburgh System

As stated in the *ELECTRIC RAILWAY JOURNAL* of July 24 in a descriptive article on the claim department of the Pittsburgh (Pa.) Railways, that organization merits description on account of its employment of the most modern type of organization and its recognition of the value of psychology, fixed principles, definite policies and unit efficiency in every-day claim work. The particular form of organization used, the co-operatively functional, was described in the issue just mentioned, while the psychological and similar features will be discussed in this article.

NAME OF DEPARTMENT CHANGED

Before proceeding with a discussion of these features, however, it will be well to call attention to a change in the name of the claim department that occurred after the first article was published. With the appointment of Cecil G. Rice as assistant to the president, as published in the *ELECTRIC RAILWAY JOURNAL* of Aug. 14, his former position of superintendent of the claim department was abolished, and the work theretofore handled by the claim department was divided among the "Associated Bureaus," comprising the five bureaus described in the previous article—clerical, inspection, medical, adjustment and litigation. The chief of each one of these bureaus handles his work under his own name and title, but uses Mr. Rice's letterhead. Mr. Rice directs the work of all the bureaus in addition to looking after such other matters as are assigned to him by the president. With this organization the bureaus can handle any problem, whether arising in connection with claims, accidents, workmen's compensation, welfare, prevention or any other line.

CHOICE OF EMPLOYEES

To take up now the points covered by this article, the first subject is the choice of employees. To show how thoroughly at present the principles of psychology and personal efficiency are used in connection with this work, it may be said that as a result of study into the factors that should be considered in the selection of the staff, the types of acceptable men have been divided into the motive, the mental and the vital. In considering these types or in choosing between them for particular kinds of work, attention is paid to nine fundamentals with various subdivisions, as shown by the analysis in the accompanying table.

METHODS OF CONTROL AND DEVELOPMENT

Reference was made in the preceding article to the methods used in compensating, promoting and developing the employees. Looking along this same line but rather from the psychological point of view, the management has analyzed the methods to be followed in the control and development of the employees into nine divisions, as follows: Imitation, competition, compensation, stimulation, commendation, relaxation, education, loyalty and love of the business. All of these are important by virtue of their influence on the minds of the employees.

1. To train the men through imitation, a new employee, for example, is sent out with the best men in the bureau to which he is assigned and learns from these

the correct procedure to be followed. The men are taught that imitation of a worthy subject is commendable.

2. Competition is used as a spur to greater efficiency. No publication is made regarding the salaries of particular men, on account of possible jealousy, but the employees are kept informed in the abstract as to whether other men are doing more units of work.

3. The compensation method, of course, is the unit system of payment, which, as stated above, forms the basis also for competitive work. This system was described in the preceding article.

4. By stimulation is meant the direct personal efforts of the management to spur the employees on to better work. Each man in the associated bureaus is paid by check. Each month Mr. Rice calls them in one by one on pay day, hands out the checks and asks them how the work is going. These friendly talks are encouraging

TABLE SHOWING NINE FUNDAMENTALS USED IN CHOOSING TYPES OF EMPLOYEES

1—Health	{ a—Body b—Mind	
2—Appearance	{ a—Pleasing b—Dignified c—Confident	
3—Education	{ a—Mental b—Moral	{ 1—General 2—Special

9—Capacity	{ a—Ability .. b—Power .. c—Character	{ 1—Initiative 2—Reasoning 3—Energy 4—Application 5—Experience 1—Intuition 2—Determination 3—Resourcefulness 4—Enthusiasm 5—Confidence 1—Quality 2—Character 3—Temperament 4—Ambition 5—Pride

to the men and also enable the management to touch quickly upon any dissatisfaction that may have arisen.

5. In applying the commendatory method, the management follows the general rule that every employee who does a good piece of work should be made to know this fact has come to the attention of Mr. Rice. For example, a note of thanks is often sent to the chief of the bureau for the man who accomplishes any unusual or especially commendatory act.

6. As to relaxation, the company attempts to have the men work as little as possible in the evening. During the summer they are granted a two weeks' vacation with pay, according to a definitely prearranged schedule. In this connection the management has developed a novel "vacation award" voucher, whose purpose is to show definitely the date allotted, to state in dollars and cents

the actual cost of the vacation to the company and to suggest the management's appreciation for services rendered rather than the mere regarding of the vacations as a matter of routine. The employee indorses this voucher and upon his return delivers it to the superintendent in exchange for the payroll voucher. If any employee happens to be going to some place where he can do work for the department, the company pays part of the expenses.

7. The point of education is covered by the meeting papers, the library and the like. The employees are encouraged to read different books, such as the efficiency books of Walter Dill Scott, and various inspirational books, and they are all required to read the newspapers in order to keep informed on current events. They must, however, avoid the subjects of religion, politics and the war in their conversation with others.

8. The management makes a special effort to inspire loyalty in all the employees and to create a spirit of steadfast allegiance to Mr. Rice as an officer and as an individual, to the chief of the bureau, to the bureau, to all the associated bureaus and to the company. The honor system is applied in handling the men, they being assured of opportunity to prove their worth as men without distasteful espionage. They are assured a fair hearing and the support of the management.

9. In order to create a love for the business, the men are not allowed to do secret service work but must always use their own names and titles. Each one bears a finely lithographed card, stating that he is a duly accredited representative of the associated bureaus. This card is signed by the president as well as by Mr. Rice, and also by the director of the Pittsburgh department of public safety, granting the bearer the courtesy of that department. The care taken in these matters places the calling upon a higher plane in the minds of the men and those with whom they come into contact. The management guarantees to fulfill any promises made by employees, but they are especially taught that the old "strong-arm" claim agent is extinct and that in every act they must be so dignified, honorable, polite and above-board that no act of theirs will cast discredit upon the modern form of claim representative, their own officers or the department. They are made to see that the work is perfectly honorable and dignified, a feeling which is a necessary and most important foundation for the inculcation of a similar feeling on the part of the public. The theory that confidence and fairness beget confidence and fairness is developed.

EMPHASIS ON FIXED PRINCIPLES

As stated in the preceding article, the management has made up six fixed principles to govern the work of the employees. These are as follows:

1. *Maximum Accuracy*—Incontrovertible facts unearthed from all available sources.
2. *Utmost Expediency*—The promptest action in accord with propriety and correctness.
3. *Absolute Fairness*—A fixed, irrevocable policy of dealing with justice to all concerned.
4. *Persistent Courtesy*—Constant politeness combined with kindness.
5. *Minimum Consistent Expenditures*—Disbursements proportionate to all the facts.
6. *Perfect Co-operation and Efficiency*—Working in harmony to produce the most satisfactory results with the least expenditure of time and effort.

The management takes great care to impress these principles upon the employees on account of the benefit to be derived by the employees and by the department if they are always kept in mind. In each office of the

bureaus all the principles are printed, framed and posted. When a new man comes into the office, he is made to understand that there are high ideals in claim work, and both he and the old men are constantly reminded that these principles are the fundamental rules that must guide their every act.

Moreover, each outside man has a black leather pocket case which on one-half inside contains his lithographed identification card and on the other his name and a list of the six principles, with this statement: "Issued as official instructions for your guidance." This has a beneficial effect not only upon the bearer but also upon all to whom the identification case is presented for inspection.

FUNDAMENTAL PSYCHOLOGICAL PRINCIPLES

In developing the use of psychology in claim work, the management has analyzed for the convenience of employees the various methods of arriving at decisions and essentials governing the procedure, as follows:

1. How decision is arrived at:
 - a—Reasoning pro and con by elimination.
 - b—Reasoning and choosing by result of effect on mind.
 - c—Intuition.
 - d—Hazard.
 - e—Suggestion.
2. Essentials governing procedure:
 - a—Overcome prejudice:

Show by logical argument and analogy that which is true and right and thus conciliate those who prejudge without knowledge of the facts.
 - b—Inspire confidence:

Give life to trust and reliance, causing others to believe in you and to realize that you are sincere, honest and desirous of dealing equitably.
 - c—Analyze and reduce to a business basis:

Separate into component parts and prove by calculation and weight of the evidence the value of what is being purchased.
 - d—Create a desire:

Bring into existence a longing for the possession of that which will reasonably compensate for the loss sustained, considering the degree of responsibility for such loss.
 - e—Cause a determination:

Bring about a condition of mind that will result in the principal resolving to end the matter at once by exchanging that which he controls for that which you as a representative of the company possess.
 - f—Satisfactorily close the transaction:

When you have relieved the mind of doubt and animus and created a feeling of gratification by having set aright and made amends for possible wrong or injury done, then only have you most satisfactorily terminated the matter in hand.

These six psychological essentials have been thoroughly explained with particular reference to their application to the work of adjusting a claim. Adjusters in particular clearly recognize the worth of psychology in their daily work and tend more and more to develop their cases along correct psychological lines. It has been proved that these essentials are the successive steps taken in effecting a settlement, whether consciously or unconsciously.

APPLICATION OF PSYCHOLOGY

The fundamental facts underlying the Pittsburgh Railways' application of psychology to claim work are:

1. The department does not settle the "claim" but "with the claimant," his personality often being more

important than the facts and circumstances surrounding the accident.

2. Results are achieved by either logical argument or suggestion, or both.

3. A statement must of necessity be accepted as true unless a negative thought arises in the mind.

4. To inhibit a negative idea a positive one must be developed, and *vice-versa* to develop a positive idea the negative must be inhibited.

With these fundamental facts and the further explanation that psychology is the science of the mind and science is but the orderly arrangement of relative facts, the application of psychological principles is simplified for the employee by such elementary illustrations as the following:

For a "claim agent" to address a person injured in an accident as a "claimant" suggests a claim, but to approach him as a "safety inspector" and refer to him as the "principal" inhibits the idea of a "claim."

To attempt to secure a "statement" from a principal suggests an act associated with law or litigation. To ask him for a "description of the occurrence" avoids any suspicion before it is aroused. Similarly, it is better to call witnesses "observers." To say "just write your name here, please" will bring a compliance (particularly if it is accompanied by a tender of the principal's own pen casually picked up from his desk) more often than to request him to "sign" his name.

To ask a principal to "allow," "submit" or "undergo" an examination immediately suggests the principal's right to refuse and brings to his mind the embarrassment and possible irrelevant discoveries from an inspection by a doctor. Merely saying, "Our doctor will arrange with your physician for an examination at your convenience" not only inhibits the negative idea but prevents any thought of embarrassment.

To say "It is more dignified and safer to face forward when alighting" will appeal to a woman more readily than the command "Don't alight from a car backward."

As an extreme example of the negative idea, the following incident of the boy who applied for a position is related to the employees. The boy approached the prospective employer with the words, "I don't suppose you don't know about no man that don't want to hire no

kid to do no work for nothing fer him, do you, or don't you?" "Yes," answered the man thus eloquently addressed, "I don't."

SUGGESTION BY FRAMED CARTOONS

That suggestion may be by inanimate objects as well as by words or acts is strongly developed in the reception room. On the wall between the entrance door and the desk of the reception clerk are hung various enlarged, colored and framed cartoons clipped from the daily newspapers. These cartoons, some of which are shown in the accompanying illustrations, all refer to street railway operation. The first ones include cartoons showing "Mutt and Jeff" consulting a lawyer; an outburst by "Everett True," who becomes incensed at a teamster holding the track; a couple trying to convince the conductor that their 150-lb. son is under five years of age; the chronic complainer airing his views to the helpless conductor, and the result of an automobile driver failing to heed a danger sign. All of these possess that inimitable and striking humor so cleverly expressed in cartoons. Farther along and arranged to catch the eye of the caller at the psychological moment, are other cartoons showing an injured man, with the assistance of all the members of his family, telling his story to a claim agent and having the whole fabric of it spoiled by his talkative son; the claimant who sued the "company" but found himself indebted to his attorney even after recovering damages; the well-known portrayal of the "lawsuit," wherein the litigants are pulling at the head and the tail of a cow while the attorney does the milking; the red tape attending litigation, and other subjects.

There are also displayed pictures of ex-President Taft and other notables at a local ball game before and after a home run by Wagner was declared a two-base hit on account of ground rules, and photographic illustrations of the advance in electric railway equipment. To add a fine touch of mutuality a caricature of Mr. Rice is also exhibited. Unless the visitor to the reception room is a "shyster" lawyer, these silent arguments never fail to make a good impression. The fact that cartoonists are seeing the humorous futility of "suing the company" rather than acting as any sane business man would do in properly presenting any evi-

dence of indebtedness, is in the opinion of the management an evidence of the trend of public opinion.

DEFINITE POLICIES

As a matter of fact, the six fixed principles summarize the policy of all the bureaus. In dealing with attorneys, doctors and the public, however, still more specific positions are outlined.

It has come to be understood by the profession that any reputable attorney who properly represents a legitimate claimant will be received with all due regard for the ethics of his profession. If an attorney enters suit after having given the department an opportunity to adjust the claim and if the claim was not solicited by or for him, no settlement will be made directly with the plaintiff. If, however, suit is entered without any attempt to effect an adjustment or if the case was solicited, the management openly declares its right to deal directly with the principal if it so desires.

Doctors are made to understand that in any case the department is interested in the injured person receiving such treatment as will result in the best possible recovery from the injuries sustained. If the doctor gives the department a report, a reasonable first attention fee will be paid. If later a settlement is made, the doctor's bill for subsequent treatment, if reasonable, will be included in the amount of the settlement but paid directly to the doctor by the company. It is made plain that the doctor is expected to be fair and neutral in his attitude and must not act as an adjuster. If he believes that the department is fair in its dealings with principals and that his patient can secure what is due him without the expense of litigation, the doctor is asked to suggest to his patient, if the opportunity affords, the advisability of dealing directly with the company. The doctor is also told that the payment of his bill directly to him is a courtesy and not a necessary cancellation of a debt. Out of a list of 3000 doctors less than fifty are openly antagonistic to the department, and most of them without being requested will make reports of any cases treated by them. At a recent meeting of the local medical society the speakers on the subject of the "medical witness in court" voluntarily stated that in all their experience they had never been asked to report or testify to anything except what they thought to be the facts or to do any other thing which was not wholly proper.

The public is told that the company never seeks to evade any responsibility resulting from an accident, that it uses all honorable means to prevent litigation, that injured persons are received as friends and not as enemies, and that claimants are dealt with in an open,

honorable way without any underhanded or sleuthing methods being used. The point is made clear, however, that if any claimant seeks to defraud the company, its entire resources are used to defend its best interests. The public is told that an inquiry regarding an occurrence is not made on a claim basis always but in connection with a very sincere endeavor to prevent accidents, that such inquiry is merely for the purpose of securing the facts in the case and that in seeking facts the company is asking only for that to which any person is entitled.

A committee of the staff is now at work on the complete standardization of all arguments to be used by representatives of the bureaus. All such arguments are censored by Mr. Rice and his staff members with a view of educating the public to a proper understanding, of preventing harmful and incorrect statements, of gaining believers, of securing the most desirable results, both present and future, and above all of preventing any act or omission that might result in encouraging the filing of claims. This latter point is never lost to sight.

At present Mr. Rice and his staff are working on an analysis of the essential points to cover in each class of accidents, the compilation of company economics, an organization chart with a standardization of clerical and routine matters and also a concrete "code of ethics" to govern bureau employees, similar to that long since adopted by doctors and lawyers.

"DESIRABLE PUBLICITY FACTS"

It is assumed that any prejudice or mistrust on the part of the public against a claim department is the result of unfair acts on the part of others or an inherited

Copyright by Joseph Hoover & Sons Company, Philadelphia.

CARTOON DISPLAYED IN RECEPTION ROOM OF ASSOCIATED BUREAUS PITTSBURGH RAILWAYS

erroneous conception of the business of adjusting claims. Furthermore, it is taken for granted that when a principal calls at any of the offices of the bureaus, he is a probable "claimant." In order to prepare him properly for a logical consideration and discussion of his complaint, therefore, he is greeted at the desk in the reception room and later in any office of the department by a framed printed placard which contains not only the six fixed principles, which are applicable to any business, but also eight additional paragraphs of "desirable publicity facts." The placard is signed by Mr. Rice and the president of the company. The desirable publicity facts, which are dwelt upon by outside representatives, particularly No. 6, are as follows:

1. Street railway transportation companies do not insure passengers or pedestrians against injury or damage. It is wholly unreasonable to suppose that all persons injured in connection with a street car are entitled to damages.

2. If an accident occurs, the principal should not depend solely upon the conductor to make a report but should secure the number of the motorman or conductor, the exact location and the exact time.

3. If any personal injury or property damage results for which the principal was not to blame and feels justified in making a claim, he should frankly report the details of the occurrence to the associated bureaus, together with the names of the witnesses, and give every possible assistance in making an unprejudiced investigation of all the facts and circumstances. Only dishonest claimants object to a thorough inquiry being made to corroborate the facts.

4. A claim is purely a business proposition, not a matter of law, and should be presented and handled on the same basis as any other allegation of indebtedness. Proving a claim is the same as proving a bill for work done or goods furnished.

5. Any legitimate claimant making a reasonable request for reimbursement can secure a satisfactory disposition of his claim without the expense of assistance. Since a claim is the same as a bill, it is bad judgment for a claimant to employ an attorney or enter into the embarrassment, delay and uncertainty of a suit without first presenting his proof of indebtedness direct to those he believes owe him.

6. Only three classes of people bring suits for damages against these companies, viz.:

a—Prejudiced persons unacquainted with our principles governing the handling of claims.

b—Persons entitled to something but who want more than they are entitled to.

c—Persons entitled to nothing but who want something regardless of their right to it.

7. Citizens who encourage litigation, whether "ambulance chasers," neighborhood gossips, misinformed friends or someone seeking to profit from another's misfortune, should remember that in so doing they add a burden to every taxpayer, as the expense of the courts is assessed against them.

8. Remember, we seek your co-operation to prevent accidents to yourself and others.

BASIS FOR GOOD RESULTS

Members of the bureaus have been shown that best results can be obtained by understanding the following:

A loud-voiced controversy is not a logical argument. Never get angry when the other fellow is mad.

Don't let your personal feelings influence your official acts.

Try to see the other fellow's point of view. Put yourself in his place. Be sympathetic.

Make it easy for the other fellow to change his decision.

Expect hostility and prejudice but be prepared to overcome it.

Be more considerate of the ignorant, the poor and the dependent than the well-to-do and independent.

Success is obtained by the one who does what is assigned him better than anyone else has ever done it.

Reason; learn not only what is desired, but also why it is the most desirable.

Study the forms of expression that arouse resentment and avoid their use.

EPIGRAMS USED

The management has made up some epigrams which are furnished in copies to all the employees. These give concrete and pithy expression to the psychology and efficiency basis underlying all the departmental work. They are expressed in the following way:

- 1.—Criticism unreserved and appreciation unfailing is assured.
- 2.—Liability depends upon the circumstances.
- 3.—A cure for hard luck is hard work.
- 4.—Imitation of a worthy subject is commendable.
- 5.—Mastery of details eventually brings achievement.
- 6.—Science is but an orderly arrangement of relative facts.

- 1.—Freedom from personal prejudice favors fairness.
- 2.—Assiduous application assures accomplishment.
- 3.—Concentration consists of continuous contemplation of facts.
- 4.—To-morrow is too late to record facts of to-day.
- 5.—Some facts are better than none, but all the facts are best.

- 1.—System lessens work.
- 2.—Your work is honorable—honor it with system.
- 3.—Systematic accuracy produces profitable proficiency.
- 4.—Troublesome details disappear before system.
- 5.—Efficiency demands a systematic elimination of non-essentials.
- 6.—Manifestly, then, system becomes a necessity. This is a fact.

SAFETY WORK

The associated bureaus participate in the safety work that is carried on by the company to the extent of having safety lectures delivered by the officers. The men in the medical bureau are particularly active in this respect. Last year at the Pittsburgh exposition a game invented by a member of the department called "Plasafe" was widely distributed, and this same policy was pursued in the schools this year. This game is cleverly devised to show the dangers of and the penalties for carelessness that may arise between leaving home and returning at night. Special blotters are also sent out with every inquiry blank about accidents. These blotters play up various safety slogans, and all lay particular stress upon the last plank of the associated bureaus public platform. Other conservative and fundamentally educational plans are systematically used.

GENERAL RESULTS

A few years ago the company received less than 12 per cent of replies to inquiry blanks relating to accidents. To-day 65 per cent are returned with more or less detailed information, many of them carrying suggestions which are acknowledged by a personal letter from the "safety always" inspection bureau. This is accepted as proving the increased respect of the public toward claim department work.

Despite the fact that a county, or small claims court, has been in operation for two years, in which court a claimant may bring a suit up to \$1,500 with or without the services of an attorney and with or without a jury trial, there has been a decrease of exactly 50 per cent in suits pending against the Pittsburgh Railways. Moreover, out of ninety cases heard in the county court during 1914, forty-five of them resulted in verdicts for the defendant.

By far the largest accident in the history of the company occurred on Oct. 3, 1912, when a car ran wild on a heavy grade, derailed and was destroyed. One man was killed and ninety-five other persons were severely injured. This occurred at 8 a. m. By 11 a. m. each bureau was handling its end of the problem and twenty adjusters had been assigned. By 11 p. m. that night every injured person or some of his relatives had been seen by a representative of the claim department. During the day numerous solicitors for attorneys had sought to secure the claims of the injured. Notwithstanding the almost unbelievable activity of these solicitors, some of whom continued their efforts until the last claim was settled a year and nine months later, not a suit was entered. This record was duplicated during 1914, when ninety-two claims arising from one accident were similarly handled on the Beaver Valley line. Other collisions and derailments involving fifty or more persons have been disposed of in the same way.

During the fiscal year ended in March, 1915, the total expenditures of the Pittsburgh Railways covering disbursements of every kind properly chargeable to the injuries and damages account were less by \$140,000 than the amount for the corresponding previous year. In addition there was a decrease of \$2,168,866 in the amount sued for in suits pending, the number of suits being lower than at any time during the last ten years.

A Simple Work-Order System

The System Described Is Particularly Adapted to Roads with Revenues of Less than \$1,000,000 a Year

BY M. W. GLOVER, SECRETARY AND AUDITOR MOBILE LIGHT & RAILROAD COMPANY

The principal trouble with accounting systems devised for keeping accurate cost records is the expense necessary to produce the desired results. This is a problem especially interesting to lines whose gross revenues are less than \$500,000 per year. Of 382 lines reported in 1914, 259, or 68 per cent, represented companies with gross revenues under \$500,000 per year.

A complete work-order system, such as has been so admirably described by G. W. Kalweit, auditor Milwaukee Electric Railway & Light Company, in a paper presented at the 1913 Accountants' Association Convention, and published in the *ELECTRIC RAILWAY JOURNAL* for Oct. 15, 1913, may be used by any company, but many smaller companies have not found it possible to use this system on account of the expense necessary to carry it out in detail. Other "A. F. E." "job order" or "work-order" systems have been described from time to time, but most of them have been devised for the use of large companies, and the smaller lines have been getting along without any definite system of cost accounts. This is an unfortunate condition, as the information regarding costs, which can be furnished through a satisfactory work-order system, cannot be overestimated.

The management of every property, however small, should be in a position to know the exact cost of each specific job undertaken. If three city blocks of track are to be reconstructed, it is important to know just

what a similar job cost on some other property, or at some other time or place on the same property. The direct charges made to operating expenses or to road and equipment accounts do not represent the entire cost of the work, and if no cost accounting system is in use it is impossible to compare the cost of similar jobs. What contractor would build a structure conforming to certain specifications without having access to the cost statements of similar buildings, and he would revise such cost statements to meet any changes caused by altered conditions. Yet railway companies are extending their lines, improving existing properties and expending large sums without providing a proper record of the actual costs of the improvements and in many cases, even where records are kept, they fail to include charges which rightfully belong to the improvement. When the cost of these improvements are to be paid from the proceeds of a bond issue, or are charged to capital accounts, this failure to include all proper charges becomes a serious matter.

Many persons think that it is sufficient to keep accounts in accordance with classifications prescribed by the Interstate Commerce Commission or state railway commissions, to determine properly the cost of any work. This is an error, as a cost accounting system is entirely distinct from the regular system of accounts, but such system should be handled in connection with the regular system of accounts to prevent erroneous charges entering into the cost of any job, as well as to prevent the omission of proper charges from the cost statements.

It is generally admitted that no company is so small that it should not have some system of work orders to properly record the cost of improvements undertaken, as well as the cost of work of any magnitude chargeable to maintenance. It should be needless to add that a cost-accounting system should be kept by the accounting department and not by the department doing the work, as has sometimes been suggested. The principal reason for this is that overhead charges, which enter largely into the cost of all work, cannot be accurately determined except from the records of the accounting department.

A simple work-order system designed for the use of smaller companies, but which may be used by companies of any size, is briefly described below.

It is a matter of personal choice whether the name of the system used is "Authority for Expenditures" (A. F. E.), "Job Order" or "Work Order," but the name "Work-Order System" will be used here. This system can be used for work chargeable to additions and betterments, reserve funds or operating expenses, a separate series of numbers to be assigned to the different classes of work orders.

The only book needed is a journal with ten or more columns, according to the number of subdivisions desired for showing details of the work. If subdivisions are not designed, a separation of charges between labor and material only may be used. All work orders should be issued by the accounting office upon the request of the department interested, and they should be consecutively numbered; a separate series of numbers being used for work chargeable to additions and betterments, reserve funds or operating expenses, if desired.

Work orders may be divided into general and specific, or into any other subdivisions desired.

General work orders apply to charges for certain general work over a stated period of time.

Specific work orders cover the work on a specific job.

When a work order is requested, if the work is to be charged to additions and betterments or reserve funds, the authority for doing the work should be furnished;

if the work is chargeable to operating expenses it is not necessary that executive authority be furnished. In all cases the request for a work order should specify the exact nature and extent of the work, and the subdivisions which it is desired to keep of the charges.

When a work order is issued a copy should be furnished all officials interested and the accounts to be charged should be shown; the work-order number must be shown against each charge, in addition to the road and equipment or operating expense accounts chargeable. Thus, no matter where the charge originates, whether from the voucher record, payroll or material distribution, both the accounts and the work-order number should be shown. There are several reasons for this; one being to guard against errors; another, to familiarize all employees with the accounts chargeable for certain work. With other work-order systems it is customary to make all charges to the work order only, and at the end of the month, or when the work is completed, to clear the work-order account and distribute the charges to the proper road and equipment, reserve funds or operating expense accounts. This often results in an incorrect distribution of the charges, caused by the necessity of obtaining the figures before closing the accounts at the end of the month.

The following illustrations show how the system would be handled upon a request from the department preparing to do the work, the first work order being chargeable to road and equipment expenditures; the second being chargeable to operating expenses:

(1)

WORK-ORDER NO. 278.

Charge to the above work order all expenses in connection with the construction of 1 mile of track on Government Street, from Georgia Avenue to Houston Street.

Charge these expenses to the proper road and equipment accounts, and show the above work order number in addition against each charge.

Subdivide charges to this work order as follows:

A—Grading	\$.....
B—Ballast
C—Ties
D—Rails, fastenings and special work
E—Track and roadway labor
F—Paving
G—Poles and fixtures
H—Distribution system
J—Other direct expenses (inc. Eng. and Supt.)

Total

K—Overhead charges

Grand total

(2)

WORK-ORDER NO. 342.

Charge to the above work order all expenses in connection with repainting car No. 225.

Charge these expenses to operating expense account No. 30 "passenger and combination cars," and show the above work order number in addition against each charge.

Subdivide charges to this work order as follows:

A—Stripping	\$.....
B—Sand blasting, cleaning and painting outside
C—Sand blasting, cleaning and painting inside
D—Trimming
E—Other direct expenses (inc. Supt.)

Total

F—Overhead charges

Grand total

Copies of these work-orders should be sent to each official interested. In turning in time for employees engaged on this work the ticket should show the road and equipment or operating expense accounts, and in addition the work-order number. The payroll distribution, requisitions for material, and all other charges for work covered by a work-order, should show the expense accounts as well as the work-order number. The work-order record is kept entirely separate and does not interfere in any way with the other records of the accounting department. During the continuance of the work, a statement may be prepared from the work-order record, showing the charges to date, and this information is of value to the management of the company, as well as to the department doing the work, as

it shows just how the work is progressing. When the work is completed a statement should be made showing the entire cost of the work.

The overhead charges in each case should be added by the accounting department and they should be determined by a careful analysis of the work done, care being exercised to see that all proper overhead charges are included.

Where work is chargeable to road and equipment or reserve fund accounts, the amount of overhead charges should be debited to the proper accounts and operating expenses credited, by journal entry, in accordance with instructions contained in the classification prescribed by the Interstate Commerce Commission, but where the work is chargeable to operating expenses, the charges for overhead expenses will simply be shown on the work-order record for information only, and no journal entry made to cover.

A general work-order may be issued to cover the cost of renewing ties, or for any work extending over an entire year or a portion of a year when it is desired to arrive at the actual cost of such work; in fact, this system can be used to advantage in many ways for determining the cost of small jobs undertaken, as the additional work involved is negligible and can be handled without any additional clerical help.

If more information is desired the unit costs can be determined and additional statements analyzing the work undertaken can be prepared.

There is no statement furnished by the accounting department of more value to the management than statements of costs, and where this can be done without increase in expense there is no excuse for any company, however small, failing to keep such records as will enable the exact cost of work to be determined. In fact, the division of valuation of the Interstate Commerce Commission has already issued orders requiring carriers subject to its jurisdiction to adopt a uniform system of cost accounting for work chargeable to maintenance as well as for road and equipment expenditures, and it will not be long before all lines will be required to keep a cost-accounting system for determining the actual cost of work done, whether chargeable to maintenance or to capital accounts.

The system outlined above is simple, inexpensive and easily handled and can be made to furnish valuable information as to the cost of work undertaken. It is not intended to take the place of work-order systems devised for the use of lines whose revenues amount to more than \$1,000,000 per year, and who can afford the expense necessary for an elaborate system of cost accounts, but a test of the system will prove that it can be used to advantage by all smaller lines.

Interurban Railway Co-operates with Fair Associations

The lines of the Louisville & Interurban Railway, Louisville, Ky., pass two county fair grounds, at both of which fairs have recently been held. One of these is the Fern Creek Fair of Jefferson County, and the other the Shelby County Fair, at Shelbyville. The company has made a practice for several years of assisting the fair associations in every manner possible in their advertising and in the way of transporting exhibits, supplies, etc. During the days that each of the fairs is under way special service is provided. Most of the traffic is from Louisville out, large numbers of Louisville residents having earlier been residents of the sections where the fairs are held. For both occasions also the company supplies special cars one day at each place to carry delegations representing Louisville commercial organizations.

Boston versus Glasgow

The September issue of *Concerning Municipal Ownership* contains an illuminating comparison, made by F. G. R. Gordon, the prominent labor man and advocate of private ownership for public utilities, on the subject of street railway operation in Boston and Glasgow, the two cities here and abroad whose local conditions most nearly approximate each other. According to Mr. Gordon, the unusually low cost of operation of the Glasgow municipal street railway system is largely caused by two factors—namely, low wages (the average wage rate being less than half that paid in Boston) and the lower overhead expenses, fewer cars being operated per thousand population. For each passenger fare paid on the privately owned railways of Boston, labor receives 2.04 cents; out of each passenger fare in Glasgow, under municipal ownership, labor receives about $\frac{1}{2}$ cent.

The fact that labor is cheap, says Mr. Gordon, serves to reduce both the price of commodities and the cost of operation in Glasgow. For instance, the price of coal is \$1 a ton less in Glasgow than in the average American city. Rents, too, are less, and the cost of building is much lower in Glasgow than in Boston. Thus in 1913* the cost of material and power on 196 miles of street railway in Glasgow was only \$955,000. In 1914, similar charges in Boston amounted to \$4,050,795.

For 1914 Boston received, directly and indirectly, \$1,394,611 in taxes from the street railway system, or three-fifths as much as the 136 municipal street railway systems of the United Kingdom combined paid to their respective municipalities the year previous. In 1913 Glasgow received \$336,000 in the way of general rates and taxes. Thus the entire sum received, directly and indirectly, from the municipal street railway system aggregated only \$569,000 as compared to more than two and one-third times as much received by Boston from her privately owned street railway system.

Mr. Gordon questions whether the low fares in Glasgow in reality constitute a saving to the people. The British municipal street railways have adopted the so-called zone system. In 1913 the Glasgow street railways carried 311,000,000 passengers at an average fare of a little less than 2 cents. A ride which covers the first zone, a distance of 1.15 miles, costs 1 cent. Beyond this point another fare is paid and so on up to 14 cents, the entire length of the Glasgow tramway system being about 14 miles. In Boston one may ride 20 miles for 5 cents. Moreover, in Glasgow no transfers are given, while in Boston free transfers bring the average fare down to about 3.5 cents.

This system has helped greatly in the formation of the large suburban population around Boston. The zone system in Glasgow, on the contrary, has favored a concentration of the population within a very constricted area. In fact, 30 per cent of the working-class families in Glasgow live in one-room tenements. Only 2 per cent of Boston families occupy only one room.

When the street railway fare paid by Bostonians is measured by the ability of the average citizen to pay for such service, it is found that the average workingman in Boston receives more than twice the pay of the workingman engaged in a similar occupation in Glasgow. In fact a 5-cent fare in Boston assumes the proportions of a 2-cent fare in Glasgow.

Other features mentioned by Mr. Gordon include the following: The Glasgow system has 1 mile of track to each 7000 of population. The Boston system has 1 mile of track to each 2000 of population. Under municipal ownership the employees of the Glasgow street railway

system are not allowed to organize a union, but the employees of the privately-owned street railway system of Boston are allowed to unionize. To Mr. Gordon's mind, all these facts demonstrate, as far as a comparison of street railways in different countries can, the tremendous superiority of private over public ownership of street railways.

Copper Zones for Shore Line Electric Railway

A Novel Form of Duplex Receipt Provides for Stations Numbered in Accordance with the Fares Charged Between Them, and Is Used for a Transfer to Branch Lines

A change of rates has just been put into effect on the Saybrook and East Lyme divisions of the Shore Line Electric Railway, Norwich, Conn., by which the copper zone system of fares is established on the company's trackage between New Haven and New London. In connection with this the company has developed a cash receipt and transfer which is distinctly novel and which has been made the subject of an application for patent. The illustration on the following page shows the form that this ticket takes.

There are two forms, the one shown in the illustration on page 444 being used for what is called the main line, between Chester and New Haven. This division includes a branch line from Guilford to Stony Creek, and a certain number of stations out on the East Lyme division to which transfer is made at the station known as Ferry Road, No. 64.

METHOD OF APPLICATION

An examination of this ticket will show numbers opposite the names of the stations, beginning with New Haven at 0. These represent the exact amount of fare from New Haven. Guilford is station No. 28, and consequently the fare from New Haven to Guilford is 28 cents. Chester is station No. 86, and the fare from New Haven to Chester is 86 cents, the fare between any two stations is arrived at by subtracting the number opposite one station from the number opposite the other. A conductor who is not quick at figures may place the 0 of one ticket against the station from which he takes on a passenger and the exact fare may then be read to any other point on the line. For instance, place New Haven, 0, against Guilford Green, 28, and opposite Ferry Road, station 64, appears the number 36. The fare then from Guilford Green to Ferry Road is 36 cents. This figure may also be arrived at by the means described on the ticket, namely, to subtract 28 from 64. The result is the same, 36 cents.

The large figures from 1 to 9 that appear on the ticket have really no special relation to the system except that when a conductor arrives at station 22, going out from New Haven, the large figure 3 calls his attention to the fact that he should collect his Guilford Green checks between stations 22 and 24. Going west, that is from Chester to New Haven, the figure 4 warns him that he should collect his Guilford Green checks between stations 32 and 30. As a large number of people travel back and forth between the Saybrook carhouse, station 62, where steam road connection is made, and Ferry Road, the company's own junction, the figure 7 is placed between these two stations (62 and 64) as the conductor collects there in both directions.

The company is also providing a little clip to attach to the seat or pilaster of the car into which the destination check can be readily placed when folded, and these large figures seen through an opening in the clip. In other words, a conductor going out from New Haven

* In view of present conditions in Europe, the report for 1913 is taken as offering a fairer comparison.

NEW FORM OF PASSENGERS' FARE RECEIPT FOR COPPER ZONE SYSTEM

would fold his Guilford Green checks so that the figure 3 would show through the clip, and, coming in from Chester, he would fold his Guilford Green checks so that the figure 4 would show through the opening in the clip. Whether this feature will be of great value depends upon experience, but it is believed that conductors will make considerable use of it.

There are no overlapping zones, and the zones are somewhat in excess of 1 mile each, depending upon the location of little settlements or groups of houses, as terminals of the zones have been worked out to accommodate the largest number of people and have taken into consideration the direction in which these people most frequently travel. There is a minimum charge of 5 cents, which covers a ride in any part of two zones. A rider passing into the third zone is charged 6 cents; the fourth zone 8 cents, an additional charge of 2 cents being made for each zone.

USE AS TRANSFER

The use of this ticket as a transfer is also novel. The branch line stations are numbered and lettered, although the names do not appear on the ticket. Guilford is the first junction out from New Haven, and it will be noticed in the lines each side of 28, first toward Chester, 30B opposite 30, 32B opposite 32 and so on up to 40B. The station that is indicated by 40B is the end of this branch line, and this is a station that is called Stony Creek. The fare from New Haven to Stony Creek is 40 cents. That is to say, this station 40B appears in the line against 40, and the difference between punched holes governs the rate. A passenger bound

from New Haven to Stony Creek would receive an original destination check, or cash receipt, punched opposite 0 and on the other side of the ticket in the line 40.

If the passenger was going from Chester, or any point between Chester and Guilford, to Stony Creek, he would receive a ticket punched against the station from which he departed, and the 40B that will be found in line 16 would be punched. The number 16 subtracted from the number of the station at which he takes the car gives the rate that he must pay. When used as a transfer the date and hour are punched in order to cover a continuous ride.

OTHER USES

The details of the application of this ticket to the transportation of employees, trackmen and so forth are of interest. All of the company's officers and employees (except trackmen) carry passes, and the conductor punches the two stations between which the employee is traveling, the holder of the pass writing at the top of the ticket, his name and number of the pass. This avoids the use of employees' tickets, of which the company had formerly used a very large number. In the case of trackmen, the conductor punches as before and fills out the number of the men, on the back of the ticket, and the foreman of the gang signs on the front. If no foreman accompanies the gang, and they are not able to write (as is sometimes the case) the conductor, himself, signs on the front so that, in sorting these slips, those used for non-revenue passengers can be instantly thrown to one side.

School tickets are sold in \$3 books, with each ticket representing 1 cent. These are collected at the rate of one for each zone, with a minimum charge of 3 cents. That is, it costs a pupil 3 cents to ride in any part of one or two zones, and the same in three zones, 4 cents in four zones, 5 cents in five zones and so on. In other words, half rate is charged except in the case of a minimum ride, when the charge is 3 cents from a pupil and 5 cents from an adult. These tickets must be purchased through the use of an application blank fully identifying the pupil. The destination check, when used in recognition of a school ticket, is punched in the block "Pupil."

The conductor's daily report is simple. All minimum fares are rung up on the register and the register is not turned back until the end of the trip. The reading of the register each time it is changed is extended in his report, in the zone in which the change takes place, and is thrown back to zero at the end of the trip. Against each trip he sets down the opening and closing number of his destination checks and the other information that is necessary to complete the office records.

It is of interest to note that, some months ago, the company planned to change the rates on the two divisions in question by increasing the zone fares to 6 cents and leaving the zones just as they were, of unequal length and overlapping, in the way common to street railways. However, after serious consideration, it was felt that an increase to 6 cents simply emphasized the faults of the existing fixed unit of fare and varying units of service, and the company has been studying since on the plan that has now been adopted. This, it is believed, will prove to be much fairer, both to the public and to the company. It has the great advantage over an increase to 6 cents in that it effects a saving to at least a portion of the company's patrons who are certain to help make the change go through without serious opposition. Naturally, a flat increase to 6 cents for the old zones would meet with no support from any quarter.

An elaborate public announcement regarding the change has been published in the local newspapers, but the plan was discussed in the papers for some little time previous, and a number of interviews were held with people along the line who were interested. The company has begun the sale of strip tickets in books of \$2 and \$5, each ticket representing 1 cent, similar to the form of a strip mileage ticket. In this way, a passenger can pay with his ticket for a minimum fare, or any other amount, without the use of pennies.

Should Utilities Be Assessed by Public Service Commissions?*

BY F. N. FLETCHER, RENO, NEV., FORMER MEMBER STATE TAX COMMISSION

When a commission has the rights and duties of an inquisitorial body for the investigation of all the books, papers and inside information of a public utility for the purpose of determining the reasonableness of its rates and its service, is it proper and fair for such a commission with the information thus obtained for a particular purpose to turn about and, assuming an official character quite distinct, make use of the information for a purpose altogether different? Closely related to the question itself are two co-ordinate questions that will first be briefly discussed.

First the mooted question: Shall public utilities be taxed at all? In the case of those utilities which still exist unregulated by public service commissions, governed in their service and rates only by the faint menace of competition should service become too poor or rates too high, managed largely if not solely for the benefits of the stockholders and charging all the traffic will bear, there is no question that such utilities should be taxed with as near approach to intelligent valuation as the conditions allow. In the quite different case of utilities under the intelligent and continuous regulation of public service commissions it really makes little difference to the utilities whether they are taxed or not. If taxed, the amount of the taxes is added to the expense account, and rates are allowed to cover expenses. In practice it may not work out so exactly as it does in theory, but in general it may be fairly claimed that it matters little to a public utility corporation whether it pays taxes or not provided its rates are fairly and intelligently regulated by a public service commission. The incidence of its taxation is, properly enough, passed on to the consumer.

Yet aside from the interests of the utility, what interest has the public in its taxation? Plainly, the exemption from taxation of a utility properly resulting in decreased rates for service makes to the advantage of those served at the cost of all taxpayers within the taxing unit who are not served. For example, it might easily happen that the property of a power, light and water company might equal 5 per cent of the entire value of a county while it served but one-half the inhabitants. If such property were exempted from taxation and the rates to consumers correspondingly decreased the entire benefit would accrue to the consumers while the entire loss in county taxes would fall on the taxpayers outside the community served by the corporation. The same would be true of the loss of state taxes in the ratio which the value of the exempted property bore to the state's valuation.

On the assumption, therefore, that public utilities should be taxed it becomes a matter of interest to consider whether the valuation used for the determination

of rates should also be used for the assessment of taxes. While trained minds versed in the science of taxation find no difficulty in ascribing different values for different purposes to the same property, it is not so simple to the layman. Rates, however, are largely based on what is put into the property as investment, while taxes are assessed on what is taken out as income. The one is an investment value, the other an income or market value. Under constant and proper regulation of rates, however, the difference in valuation for the two purposes should be slight, and in fact should ultimately disappear, for it is evident that the fixing of the rates is the determining factor in the market value of the utility.

It is clear, then, that if utilities are to be taxed justice to all concerned demands that the assessment shall be based on knowledge derived from expert investigation. It is also clear that whether the rate-making value differs from the taxation value or not, the essential facts on which both are based are the same. In other words, while the rate-making and the assessing powers may, indeed must, use the facts for different purposes, both must use the same set of facts. From the public standpoint, then, in the important matter of investigation there is not only no argument against a public service commission fixing the assessment value of a public utility but strong economic reasons for it.

What shall be said of this procedure from the standpoint of the utilities? In those states where the rate making and the assessing powers are lodged in the same commission there will come moments of grim humor when arguments favoring high rates for a certain utility based on its high cost are compared with arguments for low tax assessment based on its low market value. There seems to be no valid objection to the same commission hearing both arguments and deciding both issues. Indeed, from the standpoint of the utilities, to have valuation for rate making and for taxation determined by one expert commission is theoretically ideal. In practice, however, where utilities are assessed by public service commissions and other property by local assessors, it is almost certain to result in a considerable increase in the assessed value of the utilities without a corresponding increase in the assessed value of other property. This manifestly works injustice either to the utilities or to that portion of the public which they serve. The cure for this injustice lies in placing the entire control of the assessing power in the hands of a single commission, which would either be the public service commission or which would accept the value fixed on utility property by this commission, and would proceed to raise the assessed value of other property to the same basis. Whether a public service commission could perform the duties of a tax commission efficiently depends on local conditions. In a small state a single commission might accomplish the twofold task, but in most states it would be impossible. But in no state should the important work of rate making or of tax assessing be left to ex-officio commissions, which are notoriously inefficient.

Finally, then, it appears that public utilities should be assessed for taxation by public service commissions. Even in states where local assessors are compelled by law to accept the valuations on utilities as fixed by the public service commissions, the method is a big improvement over the old way. It would be a still better method for the public service commission to have the power to assess for taxation all classes of property or to act with a tax commission having such power, which in most states would be the only practical plan. A centralized power which would fix the assessed valuation of all classes of property on the results of careful and scientific investigation offers the only practical solution of the problem of equitable assessment.

*Address delivered before the ninth conference of the National Tax Association, held in San Francisco, Cal., on Aug. 10-14, 1915.

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Southern California Committees Arrange for Entertainment of Convention Attendants Who Visit Los Angeles and San Diego—Hotel Reservation Committee Organized in San Francisco—Membership Pin

PROGRAM IN LOS ANGELES AND SAN DIEGO

The southern California committees of entertainment to the American Electric Railway Association and American Electric Railway Manufacturers' Association have arranged a most attractive program for the attendants at the convention and their families when they arrive in southern California. The dates of this program are Oct. 13, 14, 15 and 16, 1915, and the following has been arranged and will be carried out, with possibly some slight changes:

WEDNESDAY, OCT. 13. TRANSPORTATION DAY AT UNIVERSAL CITY

The guests will be taken from special Southern Pacific trains at San Fernando, transferred to Pacific Electric cars and then taken to Universal City, where a special program has been planned by the Universal Film Company. The party will arrive at Universal City about 11 a. m. In addition to these guests, invitations have been extended to the city officials of Los Angeles, including the Mayor and members of the City Council, representatives of the Chamber of Commerce and prominent electric railway officials of southern California. There will be an augmented band of seventy men, composed of the Pacific Electric Railway and Los Angeles Railway employees' bands, to escort the party through the Universal Film Company's grounds. The Universal Film Company's cowboys will also act as an escort and give their usual Wild West salute. Interesting scenes from important picture plays will be in progress of making, so that those present may get a true and accurate idea of how picture work is conducted. Some of the very best artists will take part in these scenes. The Zoo will be visited and there will be an exhibition of wild animals and jungle scenes.

Following this the party will partake of an elaborate Spanish barbecue under the direction of the famous Joe Romero. There will be about 350 guests in all at the barbecue. During the luncheon addresses will be made by prominent members of the association. The entertainment at Universal City, outside of the barbecue, will be directly in charge of H. McRae, general manager of the Universal Film Company, and M. G. Jonas, publicity manager of the Universal Film Company.

The evening entertainment will consist of a reception and dance at the Hotel Maryland in Pasadena, where the party will be taken by special electric trains.

THURSDAY, OCT. 14. SANTA CATALINA ISLAND DAY

At eight o'clock in the morning special Pacific Electric trains will leave Hotel Maryland, Pasadena, for San Pedro. Such guests as have headquarters in Los Angeles will leave on special Pacific Electric trains at 8.30 a. m. from the Sixth and Main Street station for San Pedro. Special boats will be provided by the Banning Company, owners of the Wilmington Transportation Company, conveying the party from San Pedro to Santa Catalina Island, where luncheon will be served with famous Catalina Island sea food as a specialty. In addition to this the committee will provide glass bottom boats for viewing the greatest submarine gardens in the world. Members will be accorded the privilege of the Golf Club on the Catalina links, if de-

sired. The return trip through Los Angeles to the Hotel Maryland in Pasadena will be made in time for dinner in the evening.

FRIDAY, OCT. 15. TRANSPORTATION DAY AT PANAMA-CALIFORNIA EXPOSITION

Special electric cars of the San Diego Electric Railway will meet the train at 7 a. m. at the Santa Fé station and convey the guests to the Coronado Ferry and from the ferry to the Hotel del Coronado. Special events will be featured at the exposition during the day, including an address of welcome by the president of the exposition, a special drill by the United States Cavalry and a special musical program on the famous out-door pipe organ. An informal reception and dance for the ladies of the party will be held at the Southern California Counties Building.

In the evening a visit will be made to the "Isthmus" which is known over the entire world and is one of the most elaborate features at the San Diego exposition. Numerous forms of amusement will be provided, and the party will be entertained at the very interesting attractions that are conducted on the Isthmus.

SATURDAY, OCT. 16. AVIATION DAY—SAN DIEGO

On Saturday special cars will leave Hotel del Coronado at 9.20 a. m. for the ferry, where they will be met by special launches which will convey the guests to the United States Aviation Field on North Island to witness a special movement of hydroplanes and aeroplanes by the United States Army aviators. Guests will be permitted to visit the hangars and inspect the machines. Following the exhibition they will be taken for a ride over San Diego Bay, returning to Hotel del Coronado at 12.30 p. m. for luncheon. At 2 p. m. a special train will leave Hotel del Coronado for Tia Juana, Mexico, returning at 6 p. m. In the evening a ball will be given in honor of the visitors at Hotel del Coronado, and after the ball they will be conveyed in special cars to the Santa Fé station, where they will board their train.

CONVENTION HOTEL RESERVATIONS

A local hotel reservation committee has been organized at San Francisco for the convenience of those who will attend the convention of the American Electric Railway Manufacturers' Association. All that is necessary is to send in a request specifying the accommodations desired and the committee will see that suitable reservations are made immediately. Application for reservations may be made either to H. G. McConaughy, 165 Broadway, New York, N. Y., or to Carl Heise, care of Westinghouse Electrical & Manufacturing Company, San Francisco, Cal.

MEMBERSHIP PIN

Secretary Burritt is making a campaign to induce members to wear the association pin. He recently sent out an attractive order card with some interesting statements bearing upon the wearing of the pin. It appears that nearly 1300 members are already wearing it, and Mr. Burritt gives as a salient reason for doing so the fact that it is likely to afford the opportunity of individual explanation of the problems which the electric railways have to solve.

COMMUNICATIONS

Cars at Less than Cost

EMPIRE UNITED RAILWAYS AND ASSOCIATED LINES
SYRACUSE, N. Y., Sept. 8, 1915.

To the Editors:

Your editorial entitled "Cars at Less than Cost" is a temptation, and I am taking the liberty of "coming back." I have just finished sopping up the tears which have been falling from my eyes in commiseration of the "poor, feeble-minded car builder," mentioned in your editorial, who has been cajoled into accepting orders for cars under ruinous competition. The illustration used, of the selling of transportation in the electric railway business at less than cost, is really hilarious when compared to the selling of electric cars by the car builder. To be sure, all of us complain, with more or less vehemence, as to the burdens we bear and the goods we sell at less than cost, but there is a difference, as pointed out by you in your editorial—only you do not go far enough. You recite the fact that the price at which we sell our goods is stipulated by law, but you fail to mention the fact that the manufacturing cost of the article which we sell to the public, namely, transportation, is dictated to us by outside sources. In the matter of power, the margin of efficiency is rather narrow, and in the matter of wages, the largest item entering into our cost, we are practically in the hands of outsiders. Taxes, paving and other imposts and burdens imposed on electric railways are beyond the control of the management, so the electric railway is not only restricted in selling price but its production cost is practically dictated by persons and circumstances over which the railways have no control.

Take, now, the case of the "poor, feeble-minded car builder," who deserves our commiseration and sympathy. The matter of manufacturing cost with him is principally one of organization, an item even more important than the cost of raw materials. The manufacturer in selling a car body at \$3,000 or \$4,000 no doubt is not making a profit on it, but any automobile manufacturer will give him lessons in how to turn out that body at half the cost and make a good profit. The difference is that the automobile manufacturer has organized and standardized; the electric railway manufacturer has not. As a matter of fact, it will take a 42-centimeter gun to jar the electric railway industry out of the smug complacency of its accustomed methods, and that 42-centimeter gun has actually been fired, and it has been fired by the automobile manufacturers with their organization and standardization. The electric railway industry is really at the dawn of a new era. Why not let the car-body manufacturers and the manufacturers of electrical equipment and accessories get together and borrow a leaf from the book of the automobile manufacturers? Let them produce a standard car at a standard price, based on an output of 100,000 cars a year, or something like that. The individual railway engineer who has such violent prejudices that he cannot accept the standard article is at perfect liberty to purchase some of the old designs or new designs of his own, always assuming the cost of the special design, of course, but if a standard car is put on the market at a price which compares favorably with automobile prices, there will be an immediate and tremendous demand for it. As a matter of fact, the electric car to-day is really what in automobile circles is referred to as an "assembled" car, and in that line of business an assembled car is looked at askance and with suspicion. Why not standardize? For instance, can anybody give any rational or tangible reason why

the electric control and the air control of a car should be segregated and consist of two separate and distinct functions, or why one handle cannot be used to apply the power, and when turning off the power in the reverse direction apply the air brakes? Not only would this simplify apparatus and save weight, but it would make the control practically foolproof. But, because air-brake manufacturers and electric manufacturers have been two distinct breeds, no one has apparently ever thought of combining the two functions. There are a dozen other points in electric car construction which could be similarly combined if the various manufacturers could be properly harmonized. Then the car will cease to be an "assembled" car.

The "poor, feeble-minded manufacturer" who sells his car at less than cost does so of his own free will and accord. He is not forced to do it by anybody or any circumstances over which he has no control. If his overhead charges made the cost of car building prohibitive, it is clearly neither the function nor the duty of his customers to absorb those charges. He is his own master when fixing his selling price, and, unlike his customers, he is largely the architect of his own costs. The car manufacturers have been helpful in building up the electric railway industry, they are individually and collectively a fine lot of men, it is a pleasure to know them and to do business with them, and it is to be regretted that competition among them is so keen as to be ruinous to themselves and harmful to the industry they have helped build up. But, let them haul their own chestnuts out of the fire and let the present crisis in car building be the starting point of a new era in their business as well as in that of their customers.

ERNEST GONZENBACH,
General Manager.

Transmission Line Progress

ARCHBOLD-BRADY COMPANY, ENGINEERS
AND CONTRACTORS

SYRACUSE, N. Y., Aug. 26, 1915.

To the Editors:

I have noted with interest the editorial on transmission line progress which appeared in the issue of the ELECTRIC RAILWAY JOURNAL for Aug. 21, page 300. The experience of this company is in line with the statements made in the editorial, but this experience would lead us to utter a word of caution in regard to the use of excessively small sizes of wire. We do not like to recommend the use of No. 2 wire on spans greater than 400 ft. in length unless the occurrence of sleet is a practical impossibility. No. 4 copper wire should rarely be used on spans of more than 300 ft. length, although under certain circumstances spans as long as 350 ft. are permissible.

Long spans are necessary, of course, with fabricated steel structures, for these must necessarily be reasonably substantial, and as a consequence the cost per unit is too high to permit their use with short spans. Even when certain light types of steel poles are used they must be set in concrete, and the high field cost offsets the saving in pole cost. We have found that it is not wise to ship fabricated steel which can be easily damaged in handling, and we therefore adhere closely to 7-in. channels as the minimum size for the main members of A-frame or laced channel poles.

In regard to the relation of the size of wire to the strength of the towers and insulators, I do not think that there is as much difference permissible in the strength of the towers and insulators as the differences in sizes of wire might seem to indicate. That is the towers and insulators cannot be made much lighter if

No. 2 rather than No. 00 wire is used. It is easily possible to get the design of the line out of proportion by having the wires too small. Bimetallic wires of great tensile strength may become available for transmission lines so that smaller wires can be used on longer spans, but they have not yet been introduced on a scale that their advantages warrant.

W. K. ARCHBOLD,
President.

Information for Railway Employees

GALESBURG RAILWAY & LIGHT COMPANY

GALESBURG, ILL., Sept. 2, 1915.

To the Editors:

I have noted in the columns of the *ELECTRIC RAILWAY JOURNAL* from time to time references to efforts which are being made to enhance the value of public libraries to employees of electric railways by having on their shelves and tables books which should be of interest and value to such employees.

In Galesburg, at the request of the company, the free public library has purchased a number of practical books on street railway work and has subscribed for a number of periodicals.

We have posted in our carhouse a list of these and also a record of calls for different books. This notice is signed by the writer.

So far the record is somewhat discouraging, there being practically no interest in those books which deal with specific topics relating to railway work.

In the line of instruction classes for employees we have been inviting the salesmen who call upon us to give informal talks to those employees interested in the particular parts of the equipment regarding which they are informed. We hope to go into this matter farther during the coming fall and will be pleased to report the results to you.

FOSTER HANNAFORD,
General Superintendent.

Express and Skip-Stop Service in Denver

THE DENVER TRAMWAY COMPANY

DENVER, COL., Aug. 31, 1915.

To the Editors:

Your editorials on the skip-stop call to mind our experience with this method of operation in Denver. On lines running east and west the stops are very close together. From property line to property line the blocks are 266 ft. long. Adding the width of street, about 60 ft., we have stops 320 ft. apart.

During the period when we were demonstrating the skip-stop plan, we stopped at every other street. Our method was devised so that if a street was missed on the out-bound trip, it was made a stopping place on the in-bound trip. We also managed to sandwich in an express service, stopping at four-block intervals along the same tracks and in the territory of the local cars, without interference from the latter.

The service proved one of the best I ever saw on a city street. Every day we hear people bemoaning the fact that they no longer have this splendid accommodation. In Denver there were no less than 100 of my neighbors who lived along another line three long blocks from the Colfax Avenue line, and about 3 miles out from the business center, who gladly walked the extra distance for the pleasure of riding upon the line having express and skip-stop service.

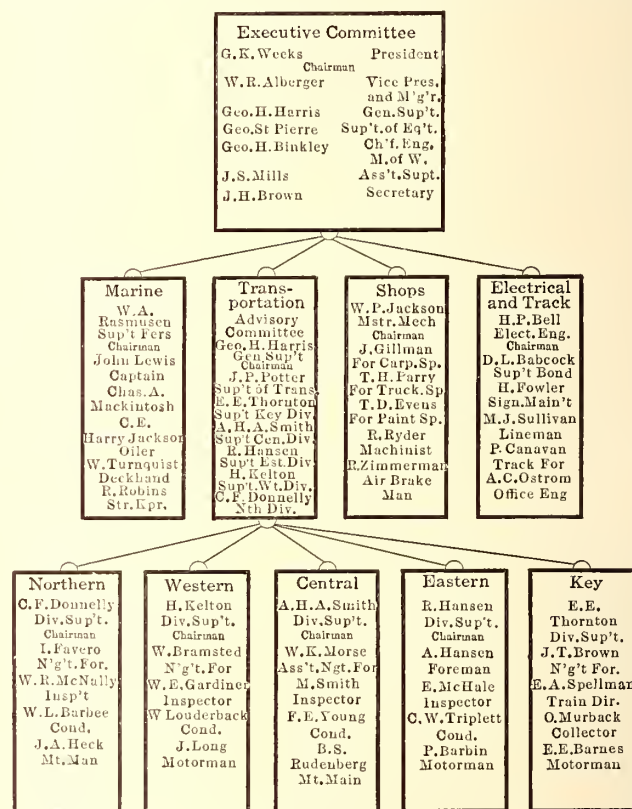

There is much to be said in favor of the skip-stop plan. It brings us nearer to competition with the faster automobile, and it is also a great boon to residents of outlying districts. Having one-half of the stops between his home and place of business eliminated is an obvious advantage to the man living 3 or 4 miles out.

Until one has seen the skip-stop in operation, it is difficult to realize how much pleasanter and smoother the riding is, and how great is the saving in time. Express and skip-stop service along city streets has to be seen to be appreciated. Like the coasting art, we do not recognize all of its many desirable features until we actually give it a trial. From my experience, I believe it to be a prime factor in the solution of the transportation problem. It certainly permits the operation of cars and trains to an infinitely better advantage.

C. B. WELLS,
Assistant to the General Manager.

A Safety-First Organization Chart

The San Francisco-Oakland Terminal Railways was among the first electric railways to form safety committees in co-operation with its employees. Changes in committee membership are made semi-annually, but enough holdovers are left to maintain the continuity of committee work. To make the safety organization

Electric Ry. Journal

OAKLAND SAFETY ORGANIZATION CHART

with its system of sub-committees and divisional committees clearer to all concerned, an organization chart was prepared some time ago. This is probably the first chart of its kind, and is of special interest in showing how the safety movement has brought in all grades of employees. The titles are self-explanatory, except perhaps for "collector," which refers to the fare collectors who assist the conductor of a train.

A number of gasoline-electric cars are being built for the Dublin & Blessington Steam Tramways Company, Dublin, Ireland. They will each accommodate seventy-five passengers, besides hauling one of the existing steam cars as a trailer. With a view to running over the system of the Dublin United Tramways, the gasoline-electric cars will be so fitted that the two motors can obtain current from the trolley wire.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Change of Trolley Wheel Design and Trolley Lubrication

BY W. P. JACKSON, MASTER MECHANIC SAN FRANCISCO-OAKLAND TERMINAL RAILWAYS, OAKLAND, CAL.

In an effort to keep the roofs and fronts of cars free from oil and more presentable in appearance, considerable success has been achieved through the substitution of solidified oil and petrolatum for oil in lubricating trolley wheels and pantograph rollers. At the same time there has been effected quite a reduction in lubrication labor and material costs.

On the Key Division, where the pantograph rollers make about 215,000 miles per month, 30 gal. of oil were required monthly for rollers. The lubrication of these rollers is now taken care of with 10 lb. of petrolatum per month, and the roofs and sides of cars are absolutely free from oil spots.

In order to lower the first cost of trolley wheels, and also to secure an oil reservoir more suitable for the use of solidified oil as a lubricant, the design of the

trolley wheels was recently changed, as shown in the accompanying illustrations. The old type of wheel weighed $4\frac{1}{2}$ lb. out of the sand, required $\frac{1}{2}$ lb. of brass for the bushing and weighed $4\frac{1}{4}$ lb. finished. The average cost of manufacture in the company shops was 73 cents each. The new type of wheel has no bushing, weighs 3 lb. 14 oz. out of the sand, and $3\frac{1}{4}$ lb. when finished. While the new type has not yet been manufactured in sufficient quantities to secure accurate data on costs, it is estimated that the reduction in material and labor will enable the shops to turn out these wheels for 57 cents each.

A five-spoke pattern was adopted on account of the additional support which would be given to the rims which wore thin or were almost worn through at the bottom.

The large grease reservoir and the $\frac{1}{4}$ -in. lubricating slot which runs all around the pin enable this type of wheel to run 1000 miles between lubrications.

Bolts and Screws

BY "VULCAN," A.M.I.C.E., A.M.I.E.E., ENGLAND

In street railway practice one often finds a difficulty in getting the average maintenance hand to appreciate the importance of paying proper attention to what superficially appear to be small details, and particularly is this the case with the men engaged in overhauling the mechanical parts. The reason for this neglect is probably that such workmen are often of the unapprenticed class, and also because the work is of rough appearance and dirty.

For instance, in the use of bolts and screws, lubrication of the threads with oil or grease is not usually carried out except by the skilled mechanics, who rarely fail in this particular matter. In such instances as in certain truck parts which will probably not be taken apart for many years, the use of dry screws or bolts which quickly rust is perhaps advantageous because the lack of lubrication assists in preventing loosening by vibration. The case is, however, totally different where periodical unbolting or unscrewing is required, because the lack of oil on the bolt or screw causes seizing of the threads to occur; this and rusting cause difficulty in loosening, which in the case of the smaller sizes often results in breakages by twisting off.

To the workman concerned in such fractures, the matter may appear a small one, but nevertheless it is often due to such seemingly small causes that much damage indirectly results, as the following instance will show.

On one system where the writer occupied the position of rolling stock superintendent, the number of faulty field coils and armatures which came to the shops for repair was considerably more than ought to have been the case, and investigation showed that the windings had at some time been wet. A night visit to the various depots and an inspection of the motors from the pits disclosed the fact that a considerable proportion of the motors were without inspection hole covers, which by causing the windings to be exposed to the splash from the car wheels in wet weather, explained the reason for

SAN FRANCISCO-OAKLAND TERMINAL RAILWAYS—OBSOLETE TYPE OF TROLLEY WHEEL

SAN FRANCISCO-OAKLAND TERMINAL RAILWAYS—NEW TYPE OF TROLLEY WHEEL

the excessive number of motor failures. For inspection purposes and for taking armature clearances these covers are removed at frequent intervals, and their replacement is forgotten now and again by careless workmen; but in this case an appreciable number had evidently been left off because one or both of the $\frac{1}{2}$ -in. screws which ordinarily hold these covers in position had been twisted off. This had probably been done in the operation of removing the covers by means of a spanner.

Seizing of the screws in the tapped holes of the motor cases of course caused the trouble, and as a broken screw on the underside of an installed motor is somewhat difficult to remove it is not surprising, perhaps, that, when discovery was unlikely to occur, the job was shirked in many cases and the covers left off. Failure to oil the screws when they were being installed was, however, the reason for the seizing or rusting fast of the screws.

Street railway car equipment often suffers unnecessarily, and many car defects are brought about by the only too common practice of neglecting thread lubrication. The men responsible for this are generally of the "anti-oil-can" class, and in such cases a sharp lesson or two appears to be the most effective cure.

Repairing Broken Tubular Iron Poles

BY S. L. FOSTER, CHIEF ELECTRICIAN UNITED RAILROADS OF SAN FRANCISCO

Various methods of repairing broken tubular iron poles have been brought out but the same old method which was in vogue twenty years ago still prevails in San Francisco.

A plan for strengthening such poles that had become weakened at the ground line by corrosion was adopted in an Eastern city, whereby a short iron tube was slipped over the top of the pole, buried a foot or two below the level of the pavement and left projecting a foot or so above it. This tube thus surrounded the pole for about 1 ft. above and below the sidewalk level, and the narrow, angular space between tube and pole was filled in with sulphur, pitch or cement. This plan necessitated stripping the pole before the tube could be threaded over it and was more popular in the city where it was invented, as the feeders were very generally underground there, than in cities where the poles were burdened with feed-wire cross-arms.

In these other cities two methods were brought out that provided reinforcement without disturbance of the wires, cross-arms, etc., attached to the poles. In one the sleeve was simply supplied in two interlocking halves. This, like the original solid sleeve plan, necessitated digging up the sidewalk, and left the pole base covered with a short length of pipe of a diameter larger than the rest of the pole, giving the pole a patched appearance.

In another plan a long skeleton, springy arrangement of reinforcing rods was inserted in the top of the pole, dropped to the bottom, and then fixed in place by immersion in a liquid mixture of cement and sand pumped into the top of the pole by some form of portable mixer and pump combined. This was not cheaply convenient in cases where single poles broke off and called for prompt attention.

The method used in San Francisco was the result of a house-moving past the location of an iron pole. Instead of digging out the pole and then replacing it after the house had passed the pole was cut off flush with the top of the sidewalk. After the house had passed, the part of the pole in the concrete setting was filled with sand to within 2 ft. of the top. A 4-ft. piece of 70-lb.

center-bearing rail that fitted the interior of the pole closely was inserted and the voids between the rail and pole were filled with a mixture of cement and sand. The upper part of the pole that had been cut off was then set down over the 2 ft. of rail sticking up above the sidewalk, the joint between the upper and lower parts of the pole was sealed by a few wraps of tape or burlap, and a bucket of liquid cement and sand or "grout" poured into the top of the pole to fill the space between the rail and the surrounding pole at the lower end. After the cement had been allowed to set for a day or two this pole was as strong or stronger than before it was cut off. It looked no different than it did before it was spliced, it had cost only a small sum to repair and the ordinary crew of emergency linemen had done all of the work without the use of any unusual appliances beyond a pail in which to mix the cement and sand, and a funnel to guide the mixture into the top of the pole.

This idea has been applied in many ways since then. For example: After the great fire of 1906 we recovered many iron poles, or rather pieces of iron poles, that looked like a lot of junk. They had been broken off or

SAN FRANCISCO METHOD OF REPAIRING BROKEN OR CORRODED TUBULAR POLES

flattened at the ground line or above it by dropping building material that had been thrown down by dynamite or had fallen during the progress of the fire. Equipped with the pole-splicing idea described, a supply of short pieces of old rail of suitable sizes, an assortment of new pipe lengths and some Portland cement, several hundred of these poles were rejuvenated at small cost to look as good as new and be stronger than when new. The splices came not only at the ground line, but in many cases above the ground line, in fact, where the first truly circular cross-section of pipe was to be found.

One more case is worth recounting. In the earliest trolley construction when No. 0 trolley wire was used some rather weak poles were used, being built up of sections of thin boiler tubing fastened at the joint insertions with rivets and "rust-joint" cementing. On a certain 82.5-ft. street with 19-ft. sidewalks, the size of the trolley wire had been increased to No. 00, and it was proposed to reduce the width of the walks to 15 ft. These 1890, 28-ft. tubing poles clearly would never stand this strain, and the expense of moving back

4 ft. the mile or so of double side poles and their concrete settings appeared likely to prove unpleasantly large. The San Francisco pole-splicing idea simplified this job greatly. An 8-ft. length of old rail was set in a block of concrete at the new pole location, leaving 2 ft. projecting above the sidewalk. The pole was cut off at the ground line, the lower part with its inclosing concrete abandoned and the upper part set down over the 2-ft. stump of rail and cemented in place.

As completed the pole was stronger in 1915 than when new—twenty-five years before—the cost of gadding the old pole out of its concrete bed or of trenching the 4 ft. and transporting the pole and setting across this 4 ft. of move was saved at little cost for old rail. These poles were taken up in alternate spans, thus leaving the spans slack on the new construction until the cement hardened.

Of course, in applying this idea the rail should always be set so as to get the best effect from it, considered as an I-beam. The cement will take care of the compression strain, and the part of the rail having the greatest amount of metal should be located in the line of the resultant strain to take care of the tension strain. Generally the head of the rail should be located at the back of the pole. In selecting old rail, also, the rail of greatest height permitted by the pole interior diameter should be selected.

The advantages claimed for this simple, foolproof method of splicing tubular iron poles is that it increases the strength of the pole without altering its external diameter or appearance; that it permits the utilization of very cheap scrap metal, a small amount of cement and the usual simple emergency crew appliances; that the materials for repairs are invariably quickly obtainable; that it necessitates no disturbance or re-establishment of the sidewalk paving; that it is fireproof and that the reinforcing is protected against oxidation inside the pole by the tubular covering of the pole and by the cement filling.

If there had been any iron poles in San Francisco during the great 1906 fire repaired by the outside tube method with the intervening space occupied by sulphur, the sulphur would surely have been ignited and the strength of the pole splice ruined.

In some sizes of poles, in order to get maximum strength in the rail insert or to make the nearest size rail section have a close fit, it was found advisable to heat and bend inward the bottom flanges of the piece of rail used in the splice, the calculated moment of inertia of the rail insert and concrete filling being greater than that of the tubular pole alone when new.

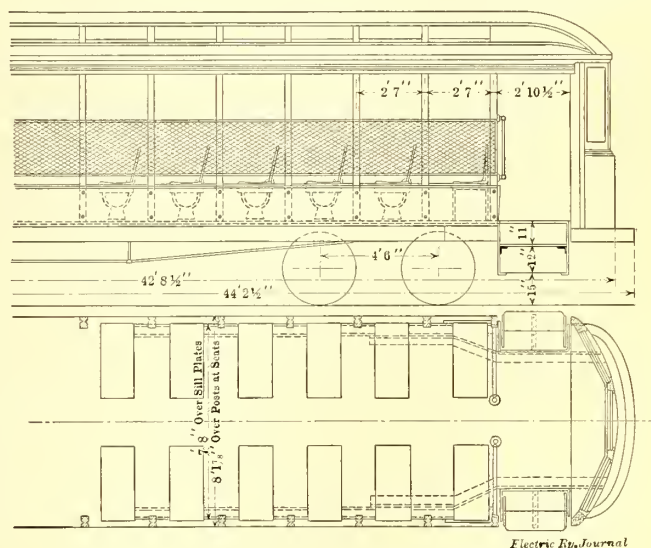

Converting Open Cars Into the End-Entrance Type

BY A. C. COLBY, MASTER MECHANIC BERKSHIRE STREET RAILWAY

The Berkshire Street Railway, Pittsfield, Mass., has undertaken the work of converting its open cars to the end-entrance type. Ten out of the fifty-three double-truck open cars operated by the company have already been changed over, and it is expected that the new arrangement will greatly reduce the number of accidents that are inevitable with ordinary open cars in high-speed interurban service. At the same time the change will enable the company to meet the requirement of the new regulation inaugurated by the State of Massachusetts which limits the height of open-car steps and thus involves the installation of double running boards. Extensive changes in the clearances along the right-of-way also affected the decision to convert the cars.

The work of conversion has consisted in the removal of the running boards and the inclosure of the car sides with steel plates and screen window guards. The cross benches have been removed and new seats with a center aisle have been provided. An aisle was provided by removing the bulkhead from the ends of the cars, and platform steps on either side of the vestibules installed.

The cars are of the usual fourteen-bench open type, and in place of the benches wood-slab reversible

Electric Ry. Journal

PLAN AND ELEVATION OF CONVERTED OPEN CAR

INTERIOR AND EXTERIOR VIEWS OF CONVERTED OPEN CARS

seats of standard dimensions have been substituted, there being thirteen seats on each side of the aisle with the new arrangement, giving a total seating capacity of fifty-two. The side sills were cut at the four corners of the car body to provide for the stepways, and two angles extending from the bolster along the inside of the sills to the bumpers were installed with an off-set to accommodate the steps. The step-way construction was reinforced by a $\frac{1}{2}$ -in. x 8-in. plate outside of the sills, bending in around the stepway and bolting to the head block.

The construction provides for two steps below the car floor with treads 9 in. wide and $34\frac{1}{2}$ in. long. The first tread is 15 in. from the rail, the second and third being respectively 12 in. and 11 in. high. The car sides have been inclosed with a steel plate 8 in. wide, which is bolted to the posts and overlaps the sills $\frac{1}{2}$ in. This has a cap of oak that forms a window ledge for the curtain, and above it is a 22-in. guard of steel mesh. It is expected that incidentally the reconstruction of the cars will add materially to their life, although the main reason for their conversion was a desire to reduce boarding and alighting accidents.

Effect of Car-Wheel Diameter on Motor Heating

BY A. L. BROOMALL, RAILWAY ENGINEERING DEPARTMENT, WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY, EAST PITTSBURGH, PA.

A number of articles have appeared in the *ELECTRIC RAILWAY JOURNAL* within the last year on the effect of car wheel diameter on motor heating,* but none of these has given specific rules by means of which the operating man can determine, even approximately, what increase in heating is to be expected from a difference in wheel diameter.

The following method may be used to analyze accurately any specific case, and the accompanying curves give the results on an average motor under varying conditions. They may be used to determine quickly the approximate difference in heating for any case.

*See issues for Oct. 3, 1914, page 622; Oct. 31, 1914, page 1014; Nov. 28, 1914, page 1203; Dec. 19, 1914, page 1344; July 10, 1915, page 70.

Fig. 1

Fig. 2

Fig. 3

FIG. 1—CHARACTERISTIC CURVES; FIG. 2—DIFFERENCES IN CURRENT DUE TO DIFFERENCES IN WHEEL DIAMETER; FIG. 3—DIFFERENCES IN HEATING DUE TO DIFFERENCES IN WHEEL DIAMETER

Curve A, Fig. 1, is the familiar speed-current curve of a car equipped with electric motors. This curve shows the car speed in miles per hour for varying amperes drawn by the motor with a given gear ratio and wheel diameter and with a definite voltage at the motor terminals. Suppose, however, that the wheels on the car were 10 per cent smaller in diameter than on the car for which curve A holds, then a similar curve for this car would be as shown at B, with speeds 10 per cent less than for the same amperes in curve A. Curve A, Fig. 1, is made up for 33-in. wheels, and curve B shows the car speeds for wheels 29.7 in. in diameter. If wheels of these two sizes are under the same car, of course, the car speed for the two wheels will be the same and the amperes drawn by the two motors will be different, as shown on the two curves for the same car speed. As an example, assume the car speed to be 10 m.p.h., then the motor mounted on the 33-in. wheels (see curve A) will draw 100 amp. and the motor mounted on the 29.7-in. wheels (see curve B) will draw 75.5 amp. or 24.5 per cent less. At 8 m.p.h., the motor mounted on 33-in. wheels will draw 190 amp. and the motor mounted on 29.7-in. wheels will draw 132 amp., or 30.5 per cent less than the motor on 33-in. wheels.

The difference in the currents drawn by the two motors depends on the shape of the speed curve. At light loads where the curve is steep, the percentage difference in amperes is small, but where the curve flattens out at heavy loads the percentage difference in amperes becomes much larger.

Having obtained for any given car speed the amperes drawn by the two motors on wheels of different size, the core loss and I^2R loss for each of the motors may be calculated and the difference in the armature heating obtained. The difference in heating for different loads on two motors of the same type varies somewhat with the design. The I^2R loss, of course, varies as the square of the current and the core loss varies only slightly with the current.

The shape of the speed curve and the distribution of losses varies with different designs, so that if accurate results are required, the difference in current drawn and the difference in heating must be worked out for each type of motor. An example of an individ-

dual case was that for which results were given in the issue of the *ELECTRIC RAILWAY JOURNAL* for July 10, 1915, page 70.

To determine the difference in heating as outlined above would often require more information than the operating man has available, and, therefore, the writer has taken an average speed curve from many railway motors and has worked out the percentage difference in current in per cent of the larger wheel value for car speeds ranging from 70 to 200 per cent of the speed at the one-hour rating of the motor on the larger wheel, and for wheel diameters which vary as much as 10 per cent. These results are given in Fig. 2.

Likewise, by taking the average variation of losses in a number of railway motors, curves were obtained giving the per cent difference in heating in per cent of the larger wheel value in terms of the one-hour rated car speed. These results are given in Fig. 3.

While the results as shown in Figs. 2 and 3 are worked up for a motor of average characteristics the error in applying them to any case will not be large and they may be used very quickly to determine the difference in heating which may be expected for a difference in wheel diameter.

As a practical example, suppose that we have a quadruple equipment of 40-hp. motors whose rated speed is 525 r.p.m. at 500 volts. These motors have a sixty-nine-tooth gear and a fifteen-tooth pinion. Assuming that three of the motors are mounted on 33-in. wheels and the fourth motor on 31-in. wheels. The difference in wheel diameter is 6 per cent of the larger wheel value. When the motors on the larger wheels are operating at the one-hour rating of the motors, the car speed is approximately 11.2 m.p.h. and, therefore, for a car speed of 11.2 m.p.h. there will be approximately 14.7 per cent difference between the amperes taken by the motor on the 31-in. wheels and the motors on the 33-in. wheels. The difference in the heating in the armatures will be approximately 19 per cent. When the car speed has increased to, say, 22.4 m.p.h. or 200 per cent of the car speed at the one-hour rating of the motor, the difference in amperes will be 6.3 per cent, and the difference in heating in the armatures will be 8.6 per cent.

It will be seen from the shape of these curves that the total difference in the heating in the armature in the two motors depends largely upon the speed at which the greater part of the operating is being done. When a large part of the running is at high speed, the difference in heating will be less than where the motors are operating at speeds nearer the one-hour rating speed.

Novelty in Indirect Lighting

The Eli Lilly Company, near Greenfield, Ind., one of the largest manufacturers of antitoxins and serums in this country, recently built a new laboratory in which two main buildings are connected by a long pergola with an impressive tower in the center. This faces the National Highway over which thousands of automobiles travel each year. Numerous attempts made to illuminate the building front in a manner that would provide a general lighting effect were found to be ineffective. Finally, however, the success of the Terre Haute, Indianapolis & Eastern Railway, which supplies power to the company, with "Golden Glow" interurban incandescent headlights led to the suggestion to try "Golden Glow" harbor range lights, manufactured by the Esterline Company of Indianapolis, and the result was so satisfactory that an entire equipment was purchased and permanently installed.

The lamps are mounted on concrete bases and are so

close to the ground as to be unnoticeable in day time, and at night it is hardly possible, from the road, to tell where the sources of light are. The fact that no maintenance is necessary with the mirrored reflectors in the "Golden Glow" lamps, and the long life of the bulbs, makes the installation an ideal one.

Transfer Issuing Machine

For some time there has been a demand from electric railway men for a practical device to print and issue transfers. The advantages of such apparatus have long been acknowledged, but the expense and the mechanical difficulties involved in its manufacture have heretofore prevented its actual production. However, the Ohmer Fare Register Company, Dayton, Ohio, has made use of its unusual facilities to plan and perfect a transfer machine that is designed in accordance with the ideas of some of the most prominent electric railway men in the country, and it is with full confidence in the success of the device that the makers now offer it to the industry.

TRANSFER
MACHINE

A transfer issued by this machine bears all the necessary data in plain bold type which any passenger can read at a glance. There are no punch holes. The date, the time, the direction, the consecutive number and the line to and from which the transfer is issued are printed, together with the conductor's identification number and the number of the machine. It is a transfer in fact and not a stop-over privilege. Time limitations are accurately and easily maintained because the time is printed mechanically when the transfer is issued.

The machine, unlike a human agency, is never confused by rush-hour traffic.

The receiving conductor is never in doubt and the passenger knows what his transfer calls for. Any transfer can be immediately traced to its source through the conductor's identification number and by the number of the issuing machine. Transfer abuses on the part of the public and traffic in transfers by trainmen are eliminated. The conductor's transfer record for the day is secured simply by having him issue a transfer to himself when he goes on duty and another when he quits work. He pins them together and turns them in. The intervening numbers are the transfers issued.

Ohmer's transfer machine reduces the cost of transfers to the cost of the plain paper upon which they are printed, the expense of handling stocks of transfers and checking them out being eliminated. Not only is the machine efficient and economical, but it has that other most important qualification—speed. It is so rapid in

MACHINE NO	FROM	TO	DIRECTION	TIME	CONSECUTIVE NUMBER	DATE
KEDZIE	21 st ST.	NE	10 25 AM	0 2 0 5	2	SEP 11 15
ISSUED BY CONDUCTOR NO. 27						
This space may be utilized for displaying any information or limitations that may be desired printed on the transfer.						

TYPICAL TRANSFER ISSUED BY MACHINE

its operation that large crowds can be handled quickly. Careful tests show about eighty transfers per minute can be issued without difficulty.

The machine is operated by a pedal, and both hands are for the most part free for receiving and registering fares and attending to other duties. The date is simply set when the conductor goes to work, the time is set at the proper intervals, and the names of the connecting lines are set by a quick movement of the hand. The conductor's identification number is printed from his numbered identification key which remains in the machine, it being necessary for the key to be in position before any transfers can be issued.

Altogether, the device appears to be a very satisfactory release from the well-known limitations of transfer pads and the hand punch. It is very economical of space in the car, standing on a pedestal fastened to the floor and it is so arranged that either the machine itself can be removed from the pedestal and placed upon the pedestal at the other end of the car, or else can be moved, pedestal and all, and clamped in place by means of specially designed floor plates. The machine on its pedestal stands about 4 ft. high. Without the pedestal its dimensions are as follows: 7 in. wide, $7\frac{3}{8}$ in. deep and 12 in. high. It has been built to meet the most trying conditions of city traffic, where the abuse of transfers has made such a machine a real necessity.

Novel Tests for Rail Steel

The Titanium Alloy Manufacturing Company, Niagara Falls, N. Y., has brought out in Bulletin No. 8 of its series entitled "Rail Reports" comparisons of standard and titanium-treated open-hearth rails which are based upon two types of tests of unusual character. The first of these depends upon the fact that the carbon content in steel rails as rolled is not uniform all over the cross-section, a condition that is, of course, anything but desirable owing to its effect upon the structural condition of the rail and upon the hardness of the wearing surface. The investigation covered the examination of samples from ingots from 111 heats of standard open-hearth rails and from 101 heats of titanium-treated open-hearth rails, in all of the latter 0.10 per cent of

titanium being used. As these heats averaged more than 50 tons each, the investigation covers samples from every heat of over 5000 tons of each kind of steel, or more than 10,000 tons in all.

The investigation was carried out by taking samples with a $\frac{5}{8}$ -in. drill at two points in each rail, one of these being located at the upper corner of the head, and the other being taken at the throat or where the head and web join. The results are indicated graphically in an accompanying diagram (Fig. 1) which shows in solid black the number of samples that had more than 12 per cent segregation or difference in carbon between the two points.

In general, the sample taken at the throat of each rail showed a higher carbon content than that taken at the upper corner of the head, but this condition was reversed in some cases, as is shown by the negative percentages at the right-hand side of the two diagrams. Summed up, the titanium-treated rails showed ninety-five out of 101 samples, with less than 12 per cent segregation, while the standard rail had but forty-five samples out of 111 that showed less than 12 per cent, the majority showing between 15 per cent and 30 per cent of segregation.

The bulletin also shows a "merit comparison" of samples taken from the centers of heads and from the flanges of twenty-five standard rails and twenty-five titanium-treated open-hearth rails. This comparison is based upon the fact that the strength of steel may be expressed by a formula, as indicated by M. H. Wickhorst in a report presented before the American Railway Engineering Association in 1914. The accuracy of the formula naturally depends upon the elimination of impurities in the steel, and also upon the soundness of the metal in general. As shown by the diagram, Fig. 2, the tests of actual strength indicated an order of merit that was generally below the theoretical strength that should have been developed in accordance with the formula, although in some cases the actual strength materially exceeded the theoretical strength. However, in the main, the titanium-treated rail showed an actual strength that did not fall below 60 per cent of theoretical figure in any case, while the standard open-hearth rail ran as low as 20 per cent at the center of the head, and as low as 50 per cent at the flanges.

In general, the titanium treatment effected the following improvements in the rail heads: The number of samples showing more than 80 per cent merit were increased by nearly two-thirds over the number found with standard rail, and all samples showing less than 60 per cent merit were eliminated, although 20 per cent of such samples were found in the standard steel. In the flanges, the samples that showed more than 80 per cent merit were increased by 5 per cent, and the samples showing less than 60 per cent merit were eliminated, these amounting to 8 per cent of the total number of standard samples.

FIG. 1—DIAGRAM SHOWING EXCESS OF CARBON AT THROAT OF RAIL OVER THAT AT TOP OF HEAD

FIG. 2—DIAGRAM SHOWING RELATION OF ACTUAL STRENGTH TO THEORETICAL STRENGTH BY FORMULA

Des Moines Locomotive Weighs 37 Tons

In the issue of Aug. 11, 1915, on page 274 an article was published describing the severe test to which one of the locomotives of the Inter Urban Railway of Des Moines, Iowa, was subjected in transporting 3500 Iowa troops over a section of its line. This transportation test is made all the more remarkable when the corrected weight of the locomotive is given as 37 tons instead of 55 tons.

Automatic Sand Dryer

The "Viloco" sand dryer, which is manufactured by Harry Vissering & Company, Chicago, operates upon the logical principle that as soon as sand is dry it should be free to escape, and the ability to dry sand without burning it has resulted in its adoption by a number of electric railways. Among them is the San Antonio (Tex.) Traction Company, where it has been found that the saving which is brought about by an initial investment of \$175 amounts to no less than \$36 per month.

The results have been attained by an automatic action that is made possible by a cast-iron grating located between the body of sand and the stove.

AUTOMATIC SAND DRYER

Through this grating the sand runs freely as fast as it dries, so that wet sand is prevented from coming in contact with the stove, and the vapor from the drying sand is permitted to escape freely between the grating and the body of the stove, passing into the stack through holes at the top of the heat chamber. With home-made sand dryers as usually constructed the stove is surrounded by a hopper of wire netting, and the sand which comes in contact with the stove dries first, having no means of escape until all the sand within the hopper is sufficiently dry to start running through the wire netting. In the meantime the sand that is actually in contact with the stove becomes so hot as to be thoroughly burned and to assist materially in burning out the stove itself. Of course, sand which has been burned loses its value, but with the new form of dryer the sand does not come in contact with the stove at all and all possibility of burning the stove or the sand is removed.

As shown in the accompanying illustration, the de-

vice is simple in construction. Ample cleaning slides are provided around the entire hopper base to facilitate ready removal of any material that will not pass through the openings in the cast-iron grating. The grate is a combined shaking and dumping arrangement and it can be replaced through the large ash doors, thereby making it unnecessary to dismantle the dryer in order to renew the grate.

Brazed Bonds on the Pacific Electric and Los Angeles Railways

Among the Pacific Coast railways which are using the cars and brazed bonds of the Electric Railway Improvement Company are the Pacific Electric Railway, Los Angeles and vicinity, and the Los Angeles Railway.

The former has six cars, two 1200-volt and four 600-volt, the two being used in bonding new lines and the four for maintenance and reconstruction work. During the month of May, 1915, 3547 bonds were placed with the 600-volt cars, of which 2859 were 6½-in. ET-3, 300,000 circ. mil bonds brazed on the ball of the rail, and 472 were 14-in. EC-15, 300,000 circ. mil bonds concealed beneath the joints in street work. The total number of bonds placed during this month is probably less than the average and the proportion of cable bonds used is unusually large.

The brazed bond is the company's standard for bonding joints, although special soldered bonds are still used to some extent. In block signal work connection of the reactance bond and other cables to the rails also is made by brazing.

About 300,000 brazed bonds are now in use on the Pacific Electric lines. In maintenance work old wire bonds and others are replaced with brazed bonds, as the company found the short brazed bonds to be practically free from theft and to have a much lower contact resistance.

The Los Angeles Railway uses combination gage cars made by the same manufacturer. The standard practice of this railway on city lines is to braze on the bonds in such a position that they are covered by the plates.

New Electric Locomotive for Italian Railways

The Italian State Railways are introducing a new type of electric locomotive, designed as 2-C-2, for high-speed service on lines with many curves, such as those in the Ligurean Riviera. Twenty-four of these locomotives have been ordered, eighteen of them from the Tecnomasio Italiano Brown-Boveri of Milan, with the mechanical parts partly from the Officine Meccaniche of Milan and partly from the Stabilimento Breda, near Milan. The other six will be supplied by the Construzioni Meccaniche di Saronno, with electrical equipment by the Maschinenfabrik Oerlikon, Switzerland. Both are designed by the State Railway Department, and the construction is substantially identical in both lots in order to meet the requirements of the electric traction services.

Recent statistics show that the total number of English soldier tramway men who have been killed in action, died from wounds, lost from ships of the navy, or who have died from other causes since joining the forces, is 214, of whom 186 were municipal employees and 28 were private company employees. The number of tramway employees who have given their services for the war reaches a total of 18,057, which is an average of about 30 per cent of the total number of men employed on English tramways.

Electric Railway Legal Decisions

CHARTERS, ORDINANCES, FRANCHISES

Alabama.—Demand by Passenger for Transfer in Exchange for Fare—Ejection—Right to Transfer.

Where a passenger on a street car offered to exchange his fare for a transfer and demanded that the conductor get his transfer ready before he would pay the fare, his ejection by the conductor was not wrongful, as the right to demand a transfer does not exist until the fare is paid. (*Willoughby v. Birmingham Railway, Light & Power Co.*, 66 Southern Rep., 888.)

Arkansas.—Assessments of Street Railway Tracks as "Real Estate" for Cost of Bridge.

In the absence of legislation to the contrary, the tracks of a street railroad are not "real estate," so as to be subject to a local improvement tax for construction of a bridge, it owning no right-of-way. (*Fort Smith Light & Traction Co. v. McDonough*, 177 Southwestern Rep., 926.)

California.—Fares in Cities of 100,000 Inhabitants.

Statutes 1877-78, page 18, sec. 1, declare that no street railroad in any city or town with more than 100,000 inhabitants shall be allowed to charge more than 5 cents fare for each passenger for a trip of any distance, and that a violation shall expose the owner to a forfeiture of \$250 in favor of the person so unlawfully charged. Civil Code, sec. 501, adopted in 1872, was in 1903 (Statutes 1903, page 172) re-enacted so as to provide that the rates of fare should not exceed 10 cents for one fare for any distance under 3 miles, but that in municipalities of the first class they should not exceed 5 cents. Held that, while implied repeals are not favored, yet sec. 501, as re-enacted, is apparently a revision of the earlier statute, which was repealed by implication, and so the act of 1878 is not applicable to the city of Los Angeles, though it has a population of more than 100,000. (*Suydam v. Los Angeles Railway*, 140 Pacific Rep., 55.)

Indiana.—Side Track to Power Station Not a "Switch" or "Turnout."

Under an ordinance which granted a franchise to a street railway company, plaintiff's predecessor, providing that no extension of tracks should be made and no tracks should be laid in or over any street except those then occupied and that no double tracks, except turnouts and switches, should be laid without permission to do so by ordinance or resolution of the Common Council, the company had no right to construct a track at nearly right angles to its main track extending about 350 ft., running through one alley and intersecting another to reach its power plant, since such track was not a "switch" or "turn-out," as these terms, in relation to railroads, relate to tracks in the nature of sidetracks adjacent to and used in connection with another line of track; nor did the franchise carry with it, as an incident necessary for the operation of the road, the right to construct such branch or lateral; and the fact that the company's predecessor had constructed a power plant at a considerable expense at a point accessible only by such branch or lateral did not give the company the right to construct such lateral.

In such case the act of the city treasurer in accepting the tender of rental fixed by such contract did not estop the city from removing the track contemplated by the contract. (*Indiana Railways & Light Co. v. City of Kokomo et al.*, 108 Northeastern Rep., 771.)

Louisiana.—Law of Eminent Domain Will be Strictly Construed.

Civil Code, Arts. 2626-2641, concerning the compulsory transfer of property, being special and exceptional in character, and in derogation of common right, must be strictly construed. (*Orleans-Kenner Electric Railway v. Metairie Ridge Nursery Co., Ltd.*, 68 Southern Rep., 93.)

Maryland.—Early Ordinances on Speed of Railroad Trains Not Applicable to Electric Railways.

A city ordinance which provides that no passenger, burden or other cars shall be driven, hauled or propelled on any of the railroads or railways within the city limits at any faster speed than a walk, and at no time move without a brakeman, in addition to the driver, enacted in 1839 as supplementary to an ordinance of 1832, for the better regulation of railroad cars, does not apply to electric street cars.

(*State, to Use of Needles et al., v. Maryland Electric Railways*, 92 Atlantic Rep., 962.)

Mississippi.—Crossings with Steam Railroad Tracks in Streets.

Although the right-of-way of a railroad company is its private property, and cannot, under the constitution of 1890, sec. 17, be taken for public use, except on compensation being made, it does not own city streets along or across which its tracks are laid, and cannot acquire, under Code 1906, sec. 3322, any exclusive right to the use of the streets. It can acquire in the streets only the right to locate its tracks, subject to the right of the public to continue the free use of the streets for travel, and to the right of the municipal authorities to grant similar easements. Hence a street railway company, receiving a permit from a city to lay its tracks in the streets, may extend its tracks across a railroad company's tracks in a street without first instituting condemnation proceedings and paying damages. (*Mississippi Central Railroad v. Hattiesburg Traction Co.*, 67 Southern Rep., 897.)

Minnesota.—Conditions of Condemnation Proceedings Not Nullified by Appeal.

In proceedings to condemn a railroad right-of-way, the commissioners awarded to the land-owner a specific sum of money as damages, and, in addition thereto, imposed upon the company the obligation to construct a cattle pass and certain culverts for the use of the landowner. The company appealed, and by the notice thereof limited the issues raised thereby to the question of damages. The jury in the district court reduced the damages from the amount awarded by the commissioners, but the verdict contained no reference to the conditions imposed by the report of the commissioners. The company caused judgment to be entered upon the verdict, and the judgment made no reference to the conditions. The amount thereby awarded to the landowner was paid, and he formally satisfied the judgment. It is held: That the award of the commissioners imposing the conditions referred to was not nullified by the appeal, and, since that branch of the proceeding was not challenged on the trial of the appeal, the conditions remained in force and effect. (*Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Co.*, 150 Northwestern Rep., 906.)

Missouri.—Interstate Commerce—Employers' Liability Act.

Where a street car was running wholly within the State and was carrying only intrastate passengers, the fact that it was part of a system which issued transfers for carriage in an adjoining State does not render those servants in charge subject to the federal employers' liability act of April 22, 1908, chap. 149, 35 Stat. 65 (U. S. Comp. St. 1913, secs. 8657-8665), and an action for their wrongful death may be maintained under the State law, even though, if interstate passengers had been on the car, the servants would have been engaged in interstate commerce. (*Kiser v. Metropolitan Street Railway*, 175 Southwestern Rep., 98.)

New York.—Points at which Transfers Must Be Given.

Where two street railway lines run substantially parallel and 1360 ft. apart for the greater part of their distance but one turns at right angles and crosses the other, a passenger on one of the lines is entitled to a transfer at the point of intersection to a car on the other line which will carry him back in the direction from which he came, under railroad law, sec. 181, providing that no corporation operating a street surface railroad shall charge any passenger more than 5 cents for one continuous ride from any point on its route to any other point thereof or any connecting branch thereof, within the limits of any city; it not appearing that there are any conditions of congestion or intricate connecting lines which render the giving of such transfers impracticable. (*People ex rel. New York State Railways v. Public Service Commission*, Second District, 153 New York Sup., 18.)

South Carolina.—Fenders Ordered North of Certain Meridian Line.

Civil Code 1912, sec. 3950, requiring cars operating north of a line 10 miles north of and parallel to the thirty-first meridian to be equipped with fenders, is not unconstitutional as denying the equal protection of the laws. (*Thomas v. Spartanburg Railway, Gas & Electric Co., et al.*, 85 South-eastern Rep., 50.)

LIABILITY FOR NEGLIGENCE

Alabama.—Headlights.

It is negligence, as a matter of law, for a street railway to run a car in the night time with a headlight not having sufficient capacity to cast a light upon the track, so that the motorman may perceive objects for the distance within which the car can be stopped, or for a motorman to run his car at such a rate of speed as to be unable to stop the car with the aid of appliances which he has within the distance in which, by the aid of the headlight, he can see a man prone upon the track. (*Montgomery Light & Traction Co. v. Baker*, 67 Southern Rep., 269.)

Alabama.—Liability for Injuries to Traffic Policeman.

If a motorman saw a traffic policeman on the track or in dangerous proximity thereto, with his back to the car, he was guilty of negligence in failing to sound the gong or to give warning in some way of the car's approach, as he had no right to assume that the policeman was conscious of the approach of the car. (*Mobile Light & Railroad v. Burch*, 68 Southern Rep., 510.)

Arkansas.—Rights of Mail Wagons.

A city ordinance, which gives United States mail wagons when in use collecting mail a right-of-way, is a police regulation designed for the benefit of the public to insure the United States mail free course, and does not create a right of action in favor of mail collectors against a street railway company for a violation of the ordinance. (*Bain v. Ft. Smith Light & Traction Co.*, 172 Southwestern Rep., 843.)

Indiana.—Employers' Liability Act—Construction.

The co-employers' liability act (*Burns' Ann.*, St. 1908, Sec. 8017), declaring that every railroad or other corporation operating in the State shall be liable for personal injuries suffered by any employee in specified cases, being invalid so far as it applies to corporations other than railroad companies, because imposing upon them burdens not placed upon individuals and partnerships engaged in the same business, cannot, by virtue of the words "other corporations" be extended to street and interurban railway companies. (*Hughes v. Indiana Union Traction Co.*, 105 Northeastern Rep., 537.)

Kentucky.—Frightening Horse by Track Blower.

A railway company is not responsible because a horse using the highway was frightened by the noise made by a blower used by the track gang. Although there is a right of action for such injuries, where an obstruction is placed in a highway so as to interfere with its use by travelers, or where an object is placed outside of the traveled portion of the highway by one having no lawful authority to do so, nevertheless where the object does not interfere with public travel, and there is a right to place it outside of the traveled part of the highway, irrespective of the shape and appearance or frightful qualities of the object to an ordinarily gentle horse, there is no liability. In the instant case the defendant corporation had a right to place its implements on the right-of-way in such a manner as not to interfere with public travel. (*Miller v. Kentucky Traction & Terminal Co.*, 175 Southwestern Rep., 976.)

Massachusetts.—Injuries to Occupants of Unlicensed Automobile.

Occupants of an automobile which has not been registered according to law are trespassers on the highway and have no rights against other travelers, except to be protected from reckless or wanton injury.

The mere fact that the motorman in charge of an electric car did not see plaintiff's automobile as soon as he might have seen it and did not stop his car as soon as it might have been stopped, does not show that he was guilty of wanton negligence, warranting a recovery by plaintiffs, who were trespassers on the highway, because their machine was not registered. (*Dean v. Boston Elevated Ry. Co.*, 105 Northeastern Rep., 616.)

New York.—Contributory Negligence of Passenger Hit on Platform by Train Going in Reverse Direction.

Where, in an action for wrongful death, it appeared that there had been a delay in running trains in a city subway for more than half an hour and that decedent, while waiting on an unguarded station platform and leaning slightly forward to watch for a train, was struck by an express train which came at high speed without warning, in the reverse

way of the track, the question whether she was guilty of contributory negligence was for the jury. (*D'Arcy v. Interborough Rapid Transit Co.*, 152 New York Sup., 500.)

New York.—Master and Servant—Action for Injury to Servant from Released Brakes.

Where it was not within the scope of reasonable prudence and foresight to have anticipated that a motorman would leave his car with the air brakes set, without setting the hand brakes, and that the car would start because of a leak in the air brakes and strike and kill him, negligence, if any, in not inspecting the air brakes was not the proximate cause of his death. (*Larson v. Nassau Electric Railroad*, 151 New York Sup., 694.)

North Carolina.—Contact with Live Wires Under Bridge.

An electric railway company, maintaining feed wires about 12 in. beneath a bridge, is not liable for injury to a boy of thirteen years getting down on his knees on the floor of the bridge and reaching his hand between the lower railing and flooring and touching a feed wire, for the company could not reasonably foresee the accident resulting from the boy's own independent act. (*Parker v. Charlotte Electric Railway*, 85 Southeastern Rep., 34.)

Oregon.—Injury to Passenger Rising Before Car Stops.

A street car passenger was not negligent as a matter of law in leaving her seat as the car approached her destination and going on the closed platform before the car stopped so as to bar her right to recover for injuries sustained by her being thrown from the vestibule and injured as the car suddenly rounded a curve. (*Kemp v. Portland Ry., Light & Power Co.*, 145 Pacific Rep., 274.)

Pennsylvania.—Injury to Passenger on Running Board.

Where, in an action for the death of a street car passenger, there was evidence that the car was so crowded that deceased was compelled to ride on the running board, and that, as the car passed a wagon standing still in plain view of the motorman for upward of 100 ft. as the car approached, the hub of the wheel of such wagon protruded over the running board and caused the accident, the court properly refused to direct a verdict for defendant. (*Simkins v. Philadelphia Rapid Transit Co.*, 90 Atlantic Rep., 527.)

Pennsylvania.—Injury to Passenger on Platform.

The burden of proof is on a passenger on a trolley car injured in consequence of riding on a platform to show that the car was so crowded that he could not be accommodated within. (*Frega v. Philadelphia Rapid Transit Co.*, 91 Atlantic Rep., 222.)

Rhode Island.—Starting Signal Given by Unauthorized Person.

Where a street car came to a full stop before plaintiff attempted to alight and, before she had safely alighted, was started by a signal given by some one not authorized thereto by defendant, and where the accident could not have been prevented after such signal by the exercise of due diligence on the part of the conductor or motorman, defendant was not liable. (*Moore v. Woonsocket Street Railway*, 92 Atlantic Rep., 980.)

Virginia.—Passenger Pushed from Car Step While Riding Thereon.

Where plaintiff was on the step of defendant's car when it was started and could have remained there in safety had not her hold been broken by two men who pushed past her, the act of the men was an intervening cause, and the carrier, if negligent, was not liable for injuries plaintiff received in a fall from the car. (*Virginia Railway & Power Co. v. Godsey*, 83 Southeastern Rep., 1072.)

West Virginia.—Knowledge by Agent of Incompetency of Fellow Servant.

Knowledge by an agent respecting the incompetency of employees over whom he has charge for the employer is knowledge of the employer. If a master knowingly employs or retains a careless and incompetent servant, he thereby impliedly authorizes or ratifies his negligent acts, committed in the course of his employment, and if the servant's negligence is wanton and willful or malicious, the master is liable for exemplary or punitive damages. (*Hains v. Parkersburg, Marietta & Interurban Railway*, 84 Southeastern Rep., 923.)

News of Electric Railways

B. C. ARBITRATION AWARD ACCEPTED

Agreement Made a War Measure—Letter of Manager Kidd to the Men

Between Aug. 26 and 29 meetings of the employees' unions of Vancouver, New Westminster and Victoria were held, at which the reports of the Conciliation Board in the British Columbia Electric Railway wage reduction arbitration were discussed. The men criticised the reports of the majority award, and as a result of the meetings it was decided to take a ballot on Aug. 30 as to the acceptance or rejection of the award. On Aug. 31 a committee from the union met George Kidd, general manager of the company, and stated that the result of the ballot was overwhelmingly against the acceptance of the majority report. Asked whether the company would put forward any concessions which might be placed before the men when the report as to the ballot was made, Mr. Kidd replied that the company had decided to accept the majority award in its entirety and would not consider any concessions in these terms. The committee from the union then retired and during the afternoon communicated with the international executives at Detroit asking their advice and opinion in view of the critical situation. On the evening of Aug. 31 a letter signed by Mr. Kidd was sent by mail to each employee of the company.

At midnight on Sept. 1 a mass meeting of the employees was called to receive the report of the international executive and to decide as to whether a strike should be called. The committee of the employees presented a report to this meeting, in which, according to the press, it was stated that the international executive refused to indorse a strike and advised that the majority award be accepted under protest. This message was taken to mean that the international executive would not assist the men financially in the case of a strike.

The committee also reported that during the day the company had consented to an amendment of the majority award. This consisted in making the agreement a war measure, its term being until six months after the cessation of hostilities with a minimum of twelve months and a maximum of twenty-two months. With reference to recognition of the union the agreement was altered so as to provide that employees should become and remain members of the union. The fact, however, that an employee ceased to be a member of the union did not entitle its executive to demand that he should be dismissed from the company. In such cases the general manager should decide the point, and if this was not considered satisfactory the matter should be settled by arbitration. These arrangements were made as the result of mediation by H. H. Stevens, M.P., and Dominion Fair Wage Officer McNiven. As the result of the report as to the amendments and the reply from the international executive, the mass meeting adjourned without ordering a strike.

On Sept. 3 a ballot of the employees was taken as to the acceptance of the amended award. The result was favorable by a large majority. In accordance with the direction of this ballot representatives of the employees' union signed the new agreement with the company on Sept. 4 in accordance with the majority award of the conciliation board as to wages and working conditions, the only alterations being the amendments previously noted.

The letter sent by Mr. Kidd to each employee on Aug. 31, referred to previously, was as follows:

"I have to-day been informed by the committee representing yourself as a member of the Amalgamated Association of Street & Electric Railway Employees of America that the company's employees have decided to reject the award recently given by the majority of the members of the Board of Conciliation appointed to consider the dispute existing between this company and its employees. In order to avoid any possibility of misunderstanding I wish you fully to understand the company's final and considered position in the matter as conveyed to your committee this morning.

"The award of the majority of the board is anything but satisfactory to the company, as we contended and still contend that we are entitled to a reduction of 15 per cent on our total wage bill, and also to considerable relief from the

onerous working conditions contained in the agreement which has now expired. Instead of obtaining the relief for which the company asked, a reduction of about 8 per cent on its total wage bill has been recommended, and the working conditions are practically unaltered.

"Under these circumstances the company would be justified in refusing to accept the award. Bearing in mind, however, the conditions prevailing in the Province, and fully realizing the necessity of avoiding any trouble which might still further prejudice the business interests and general welfare of the community, the company has decided to accept the recommendations of the majority of the board.

"The board recommended that the new wage schedule and working conditions should take effect on Sept. 1. Realizing, however, that the company has only to-day notified your committee of its intention to accept the award, it has been decided to continue the existing wage schedule and working conditions for one week. Should you finally decide not to accept service on the terms laid down by the majority of the board, which will, therefore, come into effect on Sept. 8, your decision will be received by the company with great regret, as we much prefer employees who have been for many years upon our payrolls to continue the operation of our system. At the same time your decision will not in any way affect the company's intention of adhering literally to the terms of the recommendation signed by the majority of the board. In the event of your refusing to continue the performance of your duties, the following course will be pursued by the company:

"A period of forty-eight hours will be given you in which to reconsider your decision. If during this time you should present yourself for duty, your services will be accepted at the rate and under the conditions laid down by the Board of Conciliation, but should you not during this time be willing to accept service, your name will be erased from the company's books. In the event of your deciding to leave our employ, you will be instructed to hand in, within the forty-eight hours referred to, your badge, pass, punch, change-fund, and any equipment which may be the property of the company. All seniority rights will expire within forty-eight hours of your failure to appear for duty, and any man afterward engaged to carry on the company's service will have a seniority standing dating from the acceptance of his application. All men so engaged will be treated as first-year men and paid accordingly. The company has arranged, as far as possible, to pay to all employees who present themselves within the forty-eight hours, for the purpose of returning their equipment, all monies which may be due to them.

"I place these matters before you clearly so that you may, before taking any steps which you may afterward regret, have no excuse for saying that you did not understand the true facts of the case, or the true intention of the company concerning this matter, and although, as I have said, the company much prefers, for the sake of peace, to operate under the award with its old employees, it cannot and will not under any circumstances deviate from the conditions herein described to you."

ORGANIZED LABOR OPPOSED TO MUNICIPAL OWNERSHIP

Organized labor will oppose the purchase by the city of Detroit, Mich., of the lines of the Detroit United Railway in the one fare zone. At a meeting of the Federation of Labor at night on Sept. 8 the report of a special committee recommending private operation was unanimously adopted. The report charges that the municipal ownership plan is undemocratic, un-American and smacks of despotism because it gives the Street Railway Commission complete power over the labor question in the event of the purchase. The report also says that adoption of the municipal ownership plan would nullify the arbitration between the commission and the street railway employees, thereby making it possible for the city to establish any kind of conditions it chooses for platform men. The action of the federation indicates an active campaign in opposition to the municipal ownership plan, particular opposition being shown by the members of the street car union.

HOLYOKE STRIKE DECLARED OFF

Responsibility for Continuation of Strike Placed on the Amalgamated Association

Following a visit of W. D. Mahon, president of the Amalgamated Association of Street & Electric Railway Employees of America, to Holyoke the strike was declared off and the men agreed to return to work on Friday morning, Sept. 10. The term of the agreement will be submitted to arbitration by the board recently named, consisting of W. H. Brooks for the company, John J. White for the union and James E. Carter as chairman.

The most conspicuous feature of the continued strike on the Holyoke (Mass.) Street Railway has been a report by the Massachusetts Board of Conciliation and Arbitration placing the burden of responsibility for the continuance of the strike on the local branch of the Amalgamated Association. In the opinion of the board the strike is unjustifiable, and the report holds that the men should return to work at once, leaving the issue between them and the company to arbitration. The points at issue as expressed in a communication to the company from the union, dated Aug. 2, are as follows: (1) Agreement to have the present scale of wages based on the day system of payment, until June 1, 1916. The present scale is, on the day basis, \$2.30 a day for the first six months, \$2.45 for the second six months, \$2.60 for the second year, \$2.70 for the third year, and \$2.85 for the fourth year and thereafter. (2) Agreement to make the schedule of runs in accordance with the so-called nine-hours-in-eleven law, and the following agreement: for all runs in excess of nine hours and not in excess of nine hours and fifteen minutes, the payment of one-half hour's extra time, and all runs in excess of nine hours and fifteen minutes and not over nine and one-half hours, payment for one hour of extra time, at the exact rate per hour divided by nine. (3) Payment for all extra work done by motormen and conductors other than regular runs, at the exact hourly rate as quoted above. (4) Establishment of a nine-hour day within ten consecutive hours for shops and carhouses, with an eight-hour day for Sundays and holidays, to be completed within nine consecutive hours, the present daily rate to be unchanged. (5) Agreement between union and company to expire on June 1, 1916.

On Aug. 15 it was agreed that the issues between the parties should be arbitrated by a board selected as previously described in these columns, and the employees returned to work. The board was selected, and subsequently objection was made to the form of the agreement by the employees in that it appeared to them that it would be within the scope of the powers of the arbitration board to fix a time-limit of the award beyond June 1, 1916, and they requested the company to amend the proposed submission to arbitration in this particular so as definitely to limit the award to the date given. The company refused to agree to this limitation and on Aug. 27 the men again struck. The report says:

"The strike still continues and up to this time neither party to the controversy has receded from its position. The company has not operated its cars since the last strike and great public inconvenience and injury to business have resulted from the continuance of the existing conditions. It may be that an element of doubt exists as to the scope of the powers of the board of arbitration chosen by the parties, but the letter of Aug. 2 and additions thereto agreed upon by the parties and the agreement of Aug. 15 were prepared and presented to the company by representatives of the employees. The company was required to execute the agreement of Aug. 15 as a condition precedent to the return of the employees then on strike, the starting of the cars and the arbitration of the existing controversy.

"The board is of opinion that the arbitration should have gone forward in accordance with the agreement of submission of Aug. 15 and that the strike of Aug. 27 should not have taken place. It is not within the province of the State board to define the limits of the powers conferred by the parties upon the arbitrators chosen. The board recommends that in view of the facts herein stated, of the great inconvenience, discomfort and hardship imposed upon the public, the injury to business and to the commercial

prestige of the city occasioned by continuance of the strike, the employees should return to work, the company receive them without discrimination, and the arbitration of the matters in dispute proceed."

Following the reception of the report the employees voted to continue the strike and Mayor Woods telegraphed President Mahon of the Amalgamated Association, pointing out that after seventeen days without car service District Organizer Reardon refused to accept arbitration for the length of term of the agreement, stating that the company was willing to arbitrate this point, which was the only one in the way of car service for 100,000 people in the Holyoke district, and asking the personal attention of Mr. Mahon with decision by wire at the earliest possible moment.

Every owner of a jitney license was summoned to a session of the aldermen on Sept. 4 and when the drivers arrived they were informed that fares must be decreased. The license committee of the Board established various local fares ranging from 5 cents to 20 cents, a speed limit of 15 m.p.h., and ordered a close definition of routes to be followed by individual chauffeurs.

FOUR FRANCHISES FOR BROOKLYN

The New York City Board of Estimate & Apportionment has voted to surface companies in the Brooklyn Rapid Transit System four important trolley franchises. Applications for these franchises had been in three of the four cases before the board for several years and had been the subject of considerable controversy, as certain of the franchise terms for which influential members of the Board of Estimate had contended were wholly unacceptable to the companies. The franchises were finally granted on the basis of a compromise in which the city yielded several of the disputed points.

The most important of the franchises covers the so-called Atlantic Avenue route and provides for a trolley route on Atlantic Avenue in Brooklyn from the vicinity of the Long Island Railroad depot easterly to Sheppard Avenue in East New York, a distance of about 5 miles. The trolley rights on Atlantic Avenue had long been in dispute. The original railroad operation there was under a steam franchise of the old Atlantic Avenue Railroad, which subsequently was merged into the Nassau Electric Railroad of the Brooklyn Rapid Transit System, the rights being leased to the Long Island Railroad. The Atlantic Avenue Railroad owned in fee a somewhat circuitous right-of-way, partly within and partly outside of the boundaries of Atlantic Avenue, and in 1853 for the purpose of strengthening and widening the street, the city of Brooklyn, the Atlantic Avenue Railroad and the Long Island Railroad entered into an agreement whereby the Atlantic Avenue Railroad received a "perpetual and exclusive right" to use a 30-ft. strip in the middle of the street for railroad purposes in exchange for certain portions of its right-of-way to be used for highway purposes.

When the Long Island Railroad electrified its line into Brooklyn and in part elevated and in part depressed the tracks, an effort was made to inaugurate trolley operation on Atlantic Avenue. This was resisted by the city and ultimately denied in the courts, it being held that the perpetual and exclusive right to the 30-ft. strip in the center of Atlantic Avenue constituted an easement and not ownership in fee and that only one railroad could be operated thereon, it making no difference in the court's opinion whether this operation was upon the surface, below the surface or above the surface. A long deadlock followed, but ultimately the Long Island Railroad and the Nassau Company came to an agreement with respect to an application for a trolley franchise by the Nassau Company on the surface of the 30-ft. strip over the Long Island tunnel or under its elevated structure as the case might be. This is the application which has now finally been granted by the Board of Estimate and adds an important trolley line to the Brooklyn surface system. Atlantic Avenue has for a long time suffered from stagnation of business and property values. The new line, it is expected, will largely relieve the Fulton Street line and the Bergen Street line of transfer passengers now received from intersecting lines running north and south.

The other franchises are known as the Metropolitan Avenue, the Eighth Avenue and the Fresh Pond Road franchises. The Metropolitan Avenue franchise extends from

Dry Harbor Road to Jamaica Plank Road in the Borough of Queens and traverses a territory which has been without convenient trolley transportation. The route is largely undeveloped at present but it is hoped that the providing of transportation will be followed by a rapid upbuilding of the territory served.

The Eighth Avenue franchise extends from Thirty-ninth Street to Bay Ridge Avenue in the South Brooklyn territory. This is a franchise which has long been sought by the local interests and provides trolley transportation for a territory in which there has been much building.

The Fresh Pond Road franchise connects the new Lutheran elevated line of the Brooklyn Rapid Transit Company with Myrtle Avenue and gives to persons in Glendale and the Forest Park section of Queens a shorter connecting ride to the elevated railroad.

It is expected that work on all of these new extensions will be begun within the next few months.

ARBITRATION OF ALBANY STRIKE

Agreement to Arbitrate Reached on Sept. 10 After Strike Declared on Labor Day

The strike of the employees of the United Traction Company in Albany, Troy, Rensselaer, Watervliet, Cohoes and Green Island, in progress since Labor Day, was settled at 2 o'clock on the morning of Sept. 10. The men and the company agreed upon arbitration. The cars started running at 5 o'clock. Mayor Cornelius F. Burns of Troy and Judge William E. Wollard and Judge Lynn J. Arnold, Troy, are to be the arbitrators. They will convene on Oct. 1 to determine if the grievances of the employees are justified. In the meantime conditions of discipline obtaining prior to June 1 will be restored as desired by the strikers. The agreement to arbitrate follows:

"The disagreement now existing between the United Traction Company and its employees of the Albany and Troy divisions, 148 and 132 respectively, is adjusted as follows: The principle that the company has the right to administer discipline to its employees is hereby affirmed. The question whether the present system of procedure now in use by the company in the disposition of discipline cases is a violation of subdivision 6 of the agreement and the question of its fairness shall be submitted to and determined by the following arbitrators: Mayor Cornelius F. Burns, Troy; Judge Lynn J. Arnold and Judge William E. Wollard, who shall meet on Oct. 1, 1915. If the arbitrators should decide after hearing both sides that the present system of procedure is not violative of section 6 of the present agreement and unfair, then it shall be adopted as the procedure in discipline cases. In the meantime the members of the associations shall report for duty and the old system of procedure in discipline cases existing before June 1, 1915, shall be in use. In witness whereof the parties hereof have hereto set their hands and seals the tenth day of September, 1915."

The strikers' committee was headed by William B. Fitzgerald, international representative of the Amalgamated Association of Street & Electric Railway Employees. Vice-President Harry W. Weatherwax and General Manager Charles F. Hewitt represented the company. In the room where the conference was held between the strikers' committee and the company officials were the arbitrators named above and John J. Mackrell, president of the Common Council of Troy and counsel for the Troy local of the strikers. Those signing the agreement were Mr. Weatherwax for the company, and Mr. Droogan, president of Division 148, and Joseph M. McLoughlin, president of Division 132. The agreement was approved by Mr. Fitzgerald for the national association.

As in many other strikes the issue was befuddled by questions of veracity between the representatives of the company and the men. The representatives of the men alleged hearings on charges without personal representation. Charles F. Hewitt, general manager of the company, said that the men were not denied the right to appeal cases in which there had been suspensions, and that out of fifty-eight suspensions since the incumbency of C. A. Coons as superintendent of transportation there had been no appeals. Regarding the administration of discipline Mr. Hewitt issued a statement on Sept. 6 in which he said:

"If Mr. Droogan (the president of the Albany division of

the Amalgamated Association) or any of the employees had felt that any employee had been punished unfairly, his case would have been appealed, and as there have been no cases appealed it is reasonably certain that the employees feel that the discipline at least has been fair. Mr. Droogan does not claim that the discipline has been unfair, but he apparently objects to the manner of applying it, and that the right of appeal has been denied to the men. This is not correct. In any single past or future case, any employee has under the rules the right to appeal, first to the general superintendent, and then to myself, and this right is not, never has been and never can be denied, and there has been no curtailment whatever in this right of appeal. My feeling is that what he objects to is that the division superintendents, after hearing the cases, have reported the matter to the general superintendent, who has suggested the discipline which has been applied by the division superintendent, Mr. Droogan wishing that the general superintendent would first hear the case without reference to the division superintendent.

"This would take up a good deal of time of the general superintendent, and in nearly all the cases would be absolutely unnecessary, and in any case when the employee desires it he can appeal his case not only to the general superintendent, but to myself, as provided for in the agreement. This works no hardship whatever on the men, because in the case of either the general superintendent or myself changing any decision of the division superintendent the man is given full pay for time lost.

"I am really greatly surprised at this whole situation; the matter is a serious one, and under the charter and by-laws of the Amalgamated Association they are not allowed to call a strike without having brought in one of their international officers and without taking an actual vote of the employees, neither of which matters seems to have been done in this case. In view of the irregularity of the proceeding it seems strange that Mr. Droogan should assume the responsibility of selecting Labor Day on which to inconvenience the people of Albany."

Sept. 8 saw the complete suspension of service in Albany, Troy, Rensselaer, Watervliet, Cohoes and Green Island. On that day there was a short conference between the officers of the company and the representatives of the men, but it was concluded abruptly upon Mr. Droogan intimating that Mr. Hewitt has sought to misrepresent matters. At this conference the president of the Troy division of the men asked in what respects the system of discipline in use in Albany was superior to that in force in Troy. Mr. Weatherwax, vice-president of the company, declared that the company had a right to adopt its own system of discipline without referring it to the men for approval.

Representatives of employers and employees involved in the strike met for a few minutes with the citizens' conference committee on Sept. 9, and then adjourned to meet again late in the afternoon. The recess was occasioned by the failure of W. D. Fitzgerald, a member of the international board of the Amalgamated Association, who has assumed full charge of the strike, to arrive in Albany.

No attempt was made by the company to operate cars in any of the places affected by the strike. On account of the complete suspension of service the public was in some cases greatly inconvenienced. All sorts of methods of transportation were quickly improvised to meet the situation. The jitney came to the front and did a flourishing business. In the interest of the public Mayor Stevens of Albany issued a strike proclamation urging all owners of private motor cars to give a lift to working people, especially women. The Mayor suggested that people willing to do this should fly the American flag at their radiators. The Mayor of Troy made a like appeal to automobile owners in that city.

PROGRESS ON MANCHESTER (ENGLAND) LINE

The work of electrifying the railway between Victoria Station, Manchester, and Bury, via Prestwich, is making rapid progress, and it is anticipated that the new service will be ready, in a restricted form, by the beginning of November. Trial runs have already taken place over parts of the line. The third-rail system is used, as on the Liverpool & Southport line. The cars will be of the corridor type, each with a capacity of between 90 and 100 passengers. The districts served include Cheetham, Higher Crumpsall, Heaton Park, Prestwich, and Whitefield.

NEW RAPID TRANSIT LINE INTO CINCINNATI

The West End Rapid Transit Company, Cincinnati, Ohio, was incorporated on Sept. 3 by J. C. Hooven, C. E. Hooven, L. E. Voorhies and Stanley Shaffer, all interested in the Cincinnati, Lawrenceburg & Aurora Electric Street Railway. The capital stock of the new company is fixed at \$10,000. The plan is to build a line from Anderson's Ferry, the present terminus of the Cincinnati, Lawrenceburg & Aurora line, to the intersection of Third and Vine Streets in the city. The line will give the Cincinnati, Lawrenceburg & Aurora road an entrance to the city and through connections with other roads to the west. Negotiations have been opened with C. L. Henry of the Indianapolis & Cincinnati Traction Company for the establishment of a connection at some point.

DES MOINES ORDINANCE

Summary of Principal Provisions of Franchise Grant to Des Moines City Railway Advanced by Chamber of Commerce

The City Council of Des Moines, Iowa, has received the Chamber of Commerce franchise looking to an extension of the rights of the Des Moines City Railway. The proposed new grant differs but slightly from the franchise submitted to the Council by the company a year ago. The franchise is for a period of twenty-five years. It provides a rate of fare of six tickets for a quarter, a 2½-cent fare for children under twelve years, children under six free, and forty tickets for \$1 for high school students. The question of capitalization for the company is not covered. The only clause by which the value of the company is fixed gives the city the right to purchase the system for \$5,000,000, based on the valuation of the company "on Aug. 1, 1915." The company must accept the franchise within thirty days after the ordinance is adopted by the city. The Council must call an election within sixty days by which the grant may be approved by the voters.

The principal provisions of the new grant have been summarized as follows:

One supervisor is to be appointed by the city; one by the company to have authority as to what shall be done affecting the quantity and quality of the service, fixing schedules, routes and terminals, and the character and equipment of cars.

Differences between the company and the city in regard to any of the provisions of the ordinance or failure of the two supervisors to agree, or any difference between the company and its employees to be settled by arbitration; one arbitrator to be appointed by each side. Should the two arbitrators fail to agree a third is to be appointed by them, and if they fail to agree the Supreme Court is to appoint the third man.

The company to spend \$1,500,000 within three years to put street railway system in first-class condition.

The company is to keep open to inspection full accounts of money expended and liabilities incurred and statistical accounts of its business and operations, and furnish monthly reports of its car mileage, etc.

The City Council is to have power to order extensions upon petition of a majority of the residents of any district not served by the company's lines, if in its opinion the return to the company will pay cost of operation and depreciation.

Six tickets for a quarter; for children under twelve years, 2½ cents; children under six ride free when accompanied by adult. High school fare, forty tickets for \$1.

No stock is to be issued except in conformance with the laws of the State, the city to be advised as to the terms and conditions of all bond and stock issues, discounts on bonds not to be considered in fixing the value of the company's property, all proceeds to be invested in betterments to the company's property.

The city is to have the right to purchase upon six months' notice. For this purpose the value of the property on Aug. 1, 1915, to be considered equal to the sum of \$5,000,000.

The company is to agree to surrender all claims in streets of the city other than granted by the ordinance, pay all interest due on any bonds secured by lien upon its property and cause the receivership suit and all-bondholders' suits to be dismissed.

If the company fails to perform terms and conditions

stipulated by the ordinance and continues to fail for three months after written notice from the city the city may repeal the franchise.

NEW YORK CONSTITUTIONAL CONVENTION COMPLETES ITS WORK

The Constitutional Convention of the State of New York, which has been drafting the new organic law for that State, practically completed its work on Sept. 4. All that remains now to be done of the preliminary work is the passing of the final draft of the proposed new constitution and an explanatory address to the people. It was expected that these matters would be taken care of when the convention reassembled on the evening of Sept. 9.

If the revised constitution is ratified by the voters the short ballot will be inaugurated in New York State at the beginning of 1917. The Governor, Lieutenant-Governor, Comptroller and Attorney-General are retained as elective officers, but the successors of the Secretary of State, the State Engineer and the State Treasurer are to be appointed by the Governor. The Department of the State Engineer in fact will be supplanted by a department of public works, with the head to have supervision of the construction, care, maintenance and operation of all the public works of the State, including canals, highways and public buildings, and this department will plan all the engineering, architectural and construction work required by the State department. If the voters approve the revised constitution the State budget will in the future be submitted to the Legislature by the Governor instead of being initiated in the Legislature and subject only to a limited veto power by the chief executive. The salaries of the lawmakers are to be raised from \$1,500 to \$2,500, with weekly railroad fares to and from their homes added. The convention decided to double the salary of the Governor, who after 1917 will receive \$20,000 annually. The convention failed to substitute the appointive system for the elective in filling positions on the bench.

The Governor's appointments are freed from the requirement of confirmation by the Senate, except in the case of members of the Industrial, Public Service, Conservation and Civil Service Commissions, which are regarded as quasi-judicial bodies. The Public Service Commissions are made constitutional bodies. So are the Tax Commission, the Industrial Commission and the Civil Service Commission.

In all 725 proposals were presented to the convention. Of these less than 100 got beyond the committees having them in charge. In many instances, however, features of proposals rejected by the committees were incorporated in omnibus proposals which were presented to the convention as committee measures.

SUBWAY APPROACH FOR NEW CLEVELAND BRIDGE

The committee on municipal art and architecture of the Cleveland Chamber of Commerce filed a report on Sept. 3 in which it unanimously recommended the construction of a subway approach to the new Superior Avenue bridge across the Cuyahoga River from the east side. The committee suggested that the subway should extend from the bridge to the Public Square under Superior Avenue and that it would not be well to arrange for emergence at any other points.

A sub-committee reported that during one twenty-four-hour period 7196 motorcycles, automobiles, motor trucks and horse-drawn vehicles passed over the viaduct, while in the same period 3437 street cars, counting cars with trailers as one and a half, crossed, making a total of 10,633 vehicles of all classes, or an average of 143 street cars and 300 other vehicles per hour. While this committee is looking at the matter from the standpoint of beauty and artistic effect largely, the fact that these figures were secured shows that it has not eliminated the practical ideas from its consideration. It will be seen that the traffic that will pass over the new bridge, which takes the place of the old viaduct, is very heavy and within a short time will be much more so, thus making blockades possible at all times. The committee suggested that the County Commissioners find some way of financing the subway so that the rentals required will make the burden of expense as light on the public as possible.

INITIATIVE ORDINANCE FOR PURCHASE OF CLEVELAND RAILWAY

An initiated ordinance was introduced in the City Council at Cleveland, Ohio, on Sept. 7 providing for the issue of \$34,000,000 of bonds for the purchase of the property of the Cleveland Railway. The measure has been referred to the proper committees. Should the committees hold the ordinance up until too late to have it voted upon at the coming fall election, about 5000 more names will be necessary to the petition in order to get it before the voters at a special election.

A discussion of the question of changing schedules on Lorain Avenue in order to give some of the men longer hours of work took place before the street railway committee on the same day. George Davies, president of the local branch of the Amalgamated Association, accused Peter Witt, street railway commissioner, of paying certain car crews to make the fast time when the new schedules were introduced on Superior Avenue. Mr. Witt told Mr. Davies that he must have a very poor opinion of some of his members. A committee of the union was before George L. Radcliffe, general manager of the Cleveland Railway, on Sept. 8. The Moylan resolution, providing for the changes demanded, was referred to the city law department for an opinion as to whether Council has authority to make changes in the schedule under the Tayler grant.

The County Commissioners have agreed to an extension of the State Road line of the Cleveland Railway for 2½ miles if the company will agree to place lights on the bridges and at the county road intersections.

The city is experimenting with a semaphore similar to the type used in New York, Detroit and other cities at busy street intersections. The semaphore consists of cross-arms at the top of an iron rod set in a heavy base. It is placed in the center of the street and operated by the patrolman on duty at the crossing. The words "Stop" and "Go" are painted on the arms and indicate the direction of traffic as the patrolman turns it.

EMPLOYEES CONCLUDE IN RHODE ISLAND ARBITRATION

Evidence was concluded on Sept. 2 on behalf of the employees of the Rhode Island Company in the arbitration proceedings at Providence. In the course of the proceedings eighty-six witnesses were examined, 2200 pages of testimony taken and 105 exhibits filed. The company's side of the case is now being presented. In one of the last hearings devoted to the union side, the question of rents was discussed by Arthur Sturgis, Boston, in connection with evidence on the cost of living. Mr. Sturgis said that the average rent paid per month by 359 motormen and conductors of the Rhode Island Company was \$13.66. The witness said that the houses obtainable in Providence were far superior to those available in New York City for the same money, but that the cost of food in New York was sufficiently lower than in Providence to make the comparative cost of living higher in the latter city. A classification of orders issued by the company since 1907 totalled 1425. They were made up as follows: automatic collectors, 16; accidents, 103; transfers and tickets, 243; full stops, 76; timetables and operation, 472; mail and newspapers, 69; reports of motormen and conductors, 10; signals, 90; fares, 44; lights, heat, doors and signs, 265; assignment of work, 15; miscellaneous, 17.

Outlining the company's case, Attorney James M. Swift said that the fact that a wage scale was first agreed upon by the union and the company in July, 1913, showed that a fair and proper settlement was then reached. Conditions had not changed materially since, and nothing that had since happened warranted an increase in wages. Wages and conditions elsewhere were immaterial. To grant the demands of the men would cost the company \$500,000 a year more than at present. The company's officials appreciated the opportunities to better the service, but only a fair dividend had been paid and the outstanding capital stock was well represented by the money invested in the system. The witnesses called for the company began rebuttal testimony in connection with previous statements of employees dealing with existing wage and working conditions. Among those

who appeared were W. D. Wright, superintendent of maintenance and equipment; B. E. Whitcomb, head of the line department; Frederick L. Barnard, chief electrician, Manchester Street power station; Daniel P. Miner, chief engineer, Manchester Street power station, and Henry F. Purington, Jr., inspector of the maintenance of way department. The last-named witness said that improved equipment had made the work easier in his department in recent years. Mr. Swift hoped to complete the company's case during the week ended Sept. 11.

MR. DOHERTY CONFERS WITH COUNSEL IN TOLEDO

Henry L. Doherty, chairman of the board of the Toledo Railways & Light Company, was in Toledo again on Sept. 1, in conference with Attorneys Thomas H. Tracy and Rathbun Fuller, but he gave out no information as to what will be the next move in the franchise negotiations with the city of Toledo.

Some time ago the City Council of Toledo, Ohio, adopted a measure ordering the Toledo Railways & Light Company to remove its tracks from that section of Huron Street between Orange and Stickney Avenues before Sept. 30, in order to allow the city to lay a new pavement. Director of Public Service Neukom has made public his intention of having the tracks removed by the city unless the company takes some steps to do so soon. It is said that the pavement on that section of the street is in bad condition, but the company will not spend any money in such improvements until the franchise matter is settled.

Electrification Proposed.—H. Hirschberg, president and treasurer of the Independence & Monmouth Railroad, operating between Independence and Monmouth, Ore., 19 miles, contemplates electrifying the road. Power will be purchased from the Oregon Power Company.

Two Chilean Concessions.—Augusto Astaburuaga has been granted an extension of two years for the beginning of work on the electric railway from Santiago to Maipo, a suburb of the city. The Compania Molinera El Globo of Collipulli, Chile, has been granted the privilege of establishing a lighting and traction system for the town. The town is 90 miles southeast of Concepción and has a population of 4000. Communications to the company should be in Spanish.

Third-Tracking Contract.—The Public Service Commission of the First District of New York has authorized the New York Municipal Railway Corporation (Brooklyn Rapid Transit System) to award the contract for the erection of steel for additional tracks on the Broadway elevated railroad in Brooklyn between Myrtle Avenue and Aberdeen Street to the Jobson-Gifford Company, the lowest bidder, for \$400,441. The company will furnish the materials and the contractor will do the work. The time limit is twelve months. Similar work between the Williamsburg Bridge and Myrtle Avenue is nearly completed.

Storm Precautions at Houston.—The city of Houston, Tex., was saved from a night or more in darkness during the recent tornado by the activity of D. A. Hegarty of the Houston Electric Company. Early in the period of the storm Mr. Hegarty began to take precautions. He telegraphed to distant cities for linemen and supplies, bringing them from as far as New Orleans, and before they were actually needed had an extra supply of wire and lights in the storeroom and the extra linemen housed in buildings of the company. Then for the five days following the storm these men worked continuously under his direction. The daily papers were loud in their praises of Mr. Hegarty, and one of them told the story of his achievement in a graphic way under the title "How Dan Hegarty Turned on the Lights."

Restoring Service Over the Galveston Causeway.—A single track trestle bridging the gaps in the causeway over Galveston Bay, caused by the recent Texas coast storm, was completed on Sept. 1 and regular operation of the Galveston-Houston Electric Railway was begun on Sept. 2 on the two-hour schedule. At the time service was resumed the broken trolley wires had not yet been restrung and a

switch engine was used to tow the interurban cars over the spaces where there were no wires. Owing to the fact that this single track is the only one connecting Galveston Island with the mainland and is used by hundreds of freight and passenger trains a day, many delays are encountered and the interurban company contemplates the immediate construction of another trestle for its exclusive use until the causeway is rebuilt.

Radial Railway Data in Preparation.—Chief Engineer Gaby of the Hydro-Electric Power Commission of Ontario made an address on the hydro-radial enterprise of the province before the convention of the Ontario Municipal Association on Sept. 2. He said that within the next few weeks statistics would be completed and reports would be ready for presentation to the various municipalities interested showing the estimated cost for the construction of a network of radial electric railways throughout the western portion of the province. Requests for this information had been received from some 300 municipalities along 1600 miles of roads in the districts from Whitby in the east, to Sarnia and Windsor in the west, including the Huron and Niagara peninsula districts.

Arrears in Taxes Claimed in Cincinnati.—The Cincinnati (Ohio) Traction Company was notified on Aug. 28 that it is indebted to the city of Cincinnati, Ohio, in the amount of \$20,810.36, and was requested to send a voucher to the city auditor for that amount. E. O. Biggs has been engaged in auditing the company's books for the city solicitor and he claims that the company has been paying the city a tax on the amount it received from the Millcreek Valley line, 3 cents per passenger, whereas the courts recently decided in other cases that the tax must be paid on the full amount charged for fare, which is 5 cents per passenger. This is one of the lines which operate over the company's tracks within the city. It has no franchise of its own. The city claims taxes on the balance from Jan. 1, 1911, to June 30, 1915, \$18,424.63, with interest, \$2,385.75.

\$160,000,000 of Contracts Under Dual System Plans.—In the *Public Service Record*, a monthly publication issued by the Public Service Commission, First District, New York, it is stated that on Aug. 1 the total amount of rapid transit contracts under the dual system plans on lines to be owned by the city was in round numbers \$160,000,000. The contractors on these lines and upon the lines to be owned by the two companies, namely, the Interborough Rapid Transit Company and the New York Municipal Railway Corporation, are employing about 20,000 men. The total of \$160,000,000 includes those parts of the new system which are already in operation, namely, the Centre Street Loop subway in Manhattan, the Fourth Avenue subway in Brooklyn and the Queensborough subway under the East River, formerly known as the Steinway tunnel. Out of more than eighty sections contracts have been let for more than sixty. It is expected that the contracts for the remaining sections will be awarded by Jan. 1.

Conference on Newport Franchise.—The City Commissioners, members of the Business Men's Club and representatives of the Cincinnati, Newport & Covington Railway met in Newport on Sept. 1 to consider the franchise question. The commissioners and the railway representatives had previously reached an agreement on almost all other important matters except the rental for the use of the streets. At the conference on Sept. 1 the commissioners stated that they were prepared to accept a lump sum of \$12,000 a year for the use of the streets, instead of an amount based on the track mileage. W. W. Freeman, president of the company, and Polk Lafoon, secretary, argued that the company should not be penalized further than the taxes it would be compelled to pay and the improvements it had agreed to make, but that it would be willing to compromise on the payment of \$3,000 a year as rental for the use of the streets and no more. Another meeting will be called to adjust the differences if possible.

PROGRAM OF ASSOCIATION MEETING

New England Street Railway Club

The *Frances* has been chartered for the annual men's outing of the New England Street Railway Club, a deep-sea fishing trip, on Sept. 16.

Financial and Corporate

ANNUAL REPORTS

Havana Electric Railway, Light & Power Company

The comparative statement of income, profit and loss of the Havana Electric Railway, Light & Power Company, Havana, Cuba, for the years ended Dec. 31, 1913 and 1914, follows:

	1914	1913
Gross earnings	\$5,396,713	\$5,417,054
Operating expenses and taxes.....	2,595,321	2,612,952
Net income	\$2,801,392	\$2,804,102
Other income	102,119	140,087
Gross income	\$2,903,511	\$2,944,189
Fixed charges	1,094,140	1,096,085
Surplus after charges	\$1,809,371	\$1,848,104
Surplus Jan. 1, 1914.....	1,313,457
Total	\$3,122,828

A summary of the operations of the various departments of the company for 1914 shows the following apportionments:

Department	Gross Earnings from Operation	Operating Expenses and Taxes	Per Cent of Gross Earnings	Net Earnings from Operation
Electric railway	\$2,915,033	\$1,405,818	48.23	\$1,509,214
Electric light.....	1,605,696	518,257	32.28	1,087,440
Gas	556,157	385,406	69.30	170,751
Stage lines.....	319,827	285,840	89.37	33,987
Total	\$5,396,713	\$2,595,321	48.09	\$2,801,392

The decrease in gross earnings for the year amounted to \$20,340 or 0.33 per cent, while the operating expenses and taxes decreased 0.66 per cent. Rainy days, which were more in 1914 by 23 per cent than in 1913, had a disastrous effect upon car earnings. Moreover, the curtailment of public construction work, the paralysis of travel in certain districts because of quarantine for bubonic plague, the competition of a United Railways line and for a time of a motor omnibus line and the closing of cigar factories on account of the European war, all operated to decrease the electric railway earnings for the first time in the company's history. In view of the events of the year, however, it is surprising that the loss was not greater. The most encouraging feature was that it was found practicable to reduce operation so that during the last four months of the year the passenger earnings per car-mile were equal to those of the preceding year. The following statistics show more fully the comparative results that were obtained for the last two years:

	1914	1913	Per Cent Change
Passenger car-miles.....	10,778,706	10,543,739	+2.23
Passenger earnings.....	\$2,794,668	\$2,839,118	-1.56
Passenger earnings per car-mile..	0.2594	0.2693	-3.68
Total operating expenses.....	1,373.937	1,426,972	-3.72
Total operating expenses per car-mile	0.1275	0.1353	-5.77

The total number of cash fare passengers carried during 1914 was 55,893,367, a decrease of 1.56 per cent as compared to 1913, but still an increase of 7.76 per cent over 1912. The freight equipment of the company did more work than in 1913, transporting a total of 282,190 long tons of materials. The locomotive car-hours increased 15.6 per cent and the trail-car-hours 27.9 per cent. The new track constructed during the year aggregated 8.28 miles, an increase of 11.5 per cent, comparable to 9.5 per cent in 1913 and 2.4 per cent in 1912. Reconstruction work on track was continued, and at the end of 1914 about 32 per cent of the track built under the original light specification had been replaced in accordance with the present heavier standard.

During the year 1914 the rolling stock was increased by twenty passenger cars of standard type and one locomotive, built in the shop, and by twenty steel 6-yd. capacity side-dump trail cars for carrying track and construction materials, shipped from the United States and assembled in the shop. Electrical equipments were received for thirty additional cars and three more locomotives to be constructed, and apparatus for the equipment of the four new locomotives and the twenty-four large steel coal cars with automatic air brakes.

The following table shows the results of operation of the company's stage lines:

	1914	1913	Per Cent Change
Stages owned	166	165	+0.61
Stages operated (daily average)	145	151	-3.97
Stage-miles run.....	3,266,518	3,402,691	-4.00
Gross earnings	\$319,826	\$356,894	-10.40
Gross earnings per stage-mile..	\$0.0980	\$0.1048	-6.49

The influence of the generally unfavorable business conditions, and the resulting greatly increased unemployment, especially in the tobacco industry, were most severely felt by the omnibus service. Two other causes contributed materially to the adverse circumstances encountered, namely, the extension of the suburban electric service of the United Railways to a numbr of neighboring small towns, which before were mostly dependent upon the omnibuses, and the very high rate of exchange of Spanish silver during the entire year, which made it so nearly equal to United States currency that there was but slight difference in fare between the omnibuses and the quicker and more comfortable electric street cars. Because of existing conditions, the trial of the electric motor omnibuses, which was projected and was referred to in the 1913 report, was deferred to more favorable times. All the new equipment of this department, however, has been designed with a view to the ultimate establishment of motor vehicle service. An attempt was made during the year by another company to operate gasoline motor buses of English type, but the receipts were so unsatisfactory that it was given up after three months' trial.

During the year the consolidated power plant, described in the ELECTRIC RAILWAY JOURNAL of May 15, 1915, page 920, was substantially completed and was by the end of 1914 carrying three-fourths of the total load. The annual report of the company, on the whole elaborate, contains a handsomely illustrated special report on this power plant. The annual report is also published in Spanish for the convenience of security holders preferring that language.

Denver Tramway System

The statement of income, profit and loss of the Denver (Col.) Tramway System for the year ended March 31, 1915, follows:

Gross earnings	\$3,263,954
Total operating expenses	1,683,960
Net earnings before deducting taxes and franchise payments	\$1,579,994
Taxes and franchise payments	279,220
Net earnings after deducting taxes and franchise payments	\$1,300,774
Other income	32,295
Gross income	\$1,333,069
Deductions from income:	
Interest on funded debt.....	\$988,415
Other deductions	22,350
Total deductions	\$1,010,765
Net income	\$322,304

This is the first report since the reorganization as of March 31, 1914, of the Denver City Tramway System. The Consolidated Securities & Investing Company was incorporated on March 30, 1914, and became the successor of the Denver Realty Company, the Boulevard Real Estate Company and the Denver Excursion Company. The Consolidated Securities & Investing Company, as successor company, acquired ownership of all the stock and bonds of the Denver & Inter-Mountain Railroad. All the stock of the Consolidated Securities & Investing Company was in turn acquired by the Denver City Tramway. Thereafter the Denver Tramway, incorporated on March 30, 1914, purchased all the property of the Denver City Tramway, which company had previously acquired the Denver Tramway Terminals Company and the Denver Tramway Power Company. The Denver Tramway thus became the owner of all the stock of the Consolidated Securities & Investing Company. The Denver & Northwestern Railway, though it is no longer an operating company (having sold its physical property to the Denver City Tramway in 1913), continues to be the holding company of the Denver Tramway.

In view of the above changes a comparison in details of the results for the first fiscal year of the Denver Tramway System with the results of the system for the year preced-

ing would be difficult. The gross earnings of the Denver Tramway, however, showed a decrease of approximately 5.21 per cent for the year just ended. By rigid economy a saving of about an equivalent amount was effected in operating expenses. A general reduction was made in salaries without cutting the wages of men receiving less than \$90 per month. After payment by the Denver Tramway of interest on \$3,167,000 of prior lien bonds and after taxes and franchise requirements, there remained available out of earnings more than 161 per cent of the fixed charges on all outstanding bonds assumed by the company.

During the year there was a total expenditure by the Denver Tramway of \$188,647 for betterments and improvements, of which \$89,106 was on account of way and structures, \$54,966 for new equipment and \$44,574 as the company's proportion of the cost of the work done in construction of the Colfax-Larimer viaduct prior to March 31, 1915. The largest item of track work was in reconstruction of 5.29 miles of single line, where all rail was replaced, principally with 73-lb. steel. The more important items of equipment added were six new trailers, four new rotary snow-sweepers, two motor utility cars, and the fitting of trail cars with bulkhead partitions and electrical heaters. Expenditures for system maintenance amounted to \$371,116. No large outlays for capital improvements are contemplated for the current year, except those to which the company is committed and which are under way. It is expected that no financing will be necessary until 1919.

The following table presents some miscellaneous statistics for the entire system:

Passengers carried:	
City lines	75,572,785
Interurban lines	956,034
Total	76,528,819
Passenger earnings per car-mile:	
City lines (cents).....	26.53
Interurban lines (cents)	28.98
Passenger earnings per car-hour:	
City lines	\$2.56
Interurban lines	4.69
Car-miles operated, passenger:	
City lines	11,174,515
Interurban	366,290
Total	11,540,805
Car-hours operated, passenger:	
City lines	1,159,205.4
Interurban lines	22,622.4
Total	1,181,827.8

Glasgow Corporation Tramways

The ordinary income of the Glasgow (Scotland) Corporation Tramways for the year ended May 31, 1915, was £1,076,877, while the working expenses, including payments to dependents of employees, were £735,987, leaving net revenue of £340,890. The ordinary income of the previous year was £1,083,846 and the working expenses £676,277, leaving net revenue of £407,569. After adding interest on investments and rent of lines, increasing the revenue to £406,717, and after deducting interest, sinking fund payments, taxes, depreciation and other expenses amounting to £393,766, the net balance of £12,951 was paid over to the common good. The gross revenue for the year decreased £6,130, and the average traffic revenue per car-mile increased from 10.609d. to 10.612d. The working expenses, excluding expenditures incurred on account of the war, increased £7,893 or 0.13d. per car-mile. This increase was mainly caused by shorter working hours, wages and taxes. A sum of £51,816 was expended in connection with the war, as follows: Allowances to dependents, £39,736; car tokens, £6,231; war bonus, £5,005; general recruiting, £541, and equipment of pipe band, £301.

During the year £76,391 was expended on capital account, making a total expenditure of £3,751,708 as of May 31, 1915. The amount to the credit of the depreciation and permanent way renewals fund on that date was £2,158,738. The total set aside for the last fiscal year was £172,310, as compared to £212,642 for the preceding year. An amount of £33,768 was expended during the year for track renewals, leaving a credit balance of £2,294,304. The general reserve fund at the end of the year had a total credit of £32,238, £1,970 having been added through the sale of obsolete equipment and £7,801 expended during the year. The sum of £65,875 was expended on the upkeep of the

ramway track in ordinary repairs. In addition to this \$68,228 was set aside to meet the cost of track renewals, calculated at the rate of \$350 per mile of single track. The total cost of ordinary repairs to the power plant and sundry machinery was \$8,137, and \$23,566 was charged against revenue to meet depreciation. The total cost of inspection and repairs of cars was \$55,965, with \$41,199 further reserved, and the total cost of maintenance of miscellaneous equipment was \$1,192, with \$1,840 reserved. The car mileage in 1914-1915 was 24,214,460, with 198.125 miles of single track in operation, and in 1913-1914 24,403,482 car-miles with 196.125 miles of single track in operation. The passengers in the two years numbered 336,260,758 and 336,654,624 respectively. At present 2223 members of the company's staff are enlisted in His Majesty's forces.

KEY ROUTE EARNINGS IMPROVE

According to an official statement issued by George K. Weeks, president, the San Francisco-Oakland Terminal Railway, Oakland, Cal., has deposited with the Wells Fargo Nevada National Bank funds for the payment of matured coupons on the Oakland, San Leandro & Hayward first mortgage 6 per cent bonds, the Alameda, Oakland & Piedmont first mortgage 6's and the Oakland Transit Company first consolidated 6's of 1918. The company has also deposited funds for the payment of interest on the Oakland Traction equipment trust certificates.

These payments have been made after providing for \$122,000 of State taxes due in August, and it is understood they will be followed by the payment, from time to time as funds are accumulated, of other matured coupons on the bonds of this system in the order of their apparent seniority.

The recent earnings of this company have been just about sufficient to pay necessary operating and maintenance charges and interest on its outstanding obligations. Some time ago the company, by reason of apparently pressing requirements for capital purposes, fell behind in the accumulation of funds to meet its semi-annual interest payments. Since that time funds to meet this interest have been advanced by various banks in San Francisco and Oakland against the agreement on the part of the road to repay these advances out of daily receipts.

When it came to advancing the interest due last July the majority of the banks felt that some movement for a permanent reorganization of the property was so imminent and the consequent possibility that the repayment of any advance made might be interrupted so greatly that they were not justified in making such advances. A plan was therefore worked out for the purchase by the banks of matured interest coupons from such holders as found it desirable to realize on the same without delay, as noted in the *ELECTRIC RAILWAY JOURNAL* of July 17. The company has now started the payment of these coupons to the banks which purchased them and to the holders who have retained them without discrimination. Previous references to the condition of this company were made in the issues of May 29, June 12 and 19, and Aug. 21 and 28.

Albuquerque (N. Mex.) Traction Co.—The Albuquerque Traction Company is to be offered for sale on Oct. 1 at the court house in Albuquerque by L. F. Lee, special master. It is expected that the group headed by George Roslington, receiver, will bid in the property.

Birmingham, Ensley & Bessemer Railroad, Birmingham, Ala.—The foreclosure sale of the Birmingham, Ensley & Bessemer Railroad, announced in the *ELECTRIC RAILWAY JOURNAL* of Sept. 4, is to take place at the Jefferson County Courthouse about the middle of October.

British Electric Traction Company, London, England.—An amended scheme of capital reorganization being considered by the British Electric Traction Company involves reducing the four outstanding classes of capital (exclusive of debentures) to two. It is proposed that the \$403,592 of cumulative 6 per cent preference stock shall be exchanged at par into a new issue of a similar character, while the \$807,185 of non-cumulative 7 per cent preference stock is to be covered as to 35 per cent into the new cumulative 6 per cent participating preference stock, while the balance

of 65 per cent will be represented by new ordinary stock. As regards the \$1,070,097 of non-cumulative 6 per cent preferred ordinary stock at present outstanding, 50 per cent will be converted into new ordinary stock, while the balance of 50 per cent will be written off altogether. Of the \$665,505 of deferred stock now outstanding, 30 per cent is to be converted into new ordinary stock, the balance of 70 per cent being regarded as lost. The \$266,371 of income certificates (non-interest bearing) are to be exchanged as to 10 per cent into fully-paid new cumulative 6 per cent participating preference shares, and as to 25 per cent into fully-paid new ordinary shares, the funds requisite for this purpose to be drawn from the company's reserves. The balance of 65 per cent of the certificates will be cancelled. Thus the capital account is to be written down by \$1,001,602. It is believed that this should suffice to enable the assets to be written down to their market value.

Empire United Railways, Inc., Syracuse, N. Y.—The Public Service Commission for the Second District of New York, has authorized the purchase by the Empire United Railways of the 2500 shares of capital stock, \$100 par value, of the Monroe County Electric Belt Line at \$9.67 a share. The stock will be paid for at \$1.67 a share when delivered, \$2 a share three months, \$2 a share six months, \$2 a share nine months and \$2 a share twelve months from Sept. 1, 1915.

Everett Railway, Light & Water Company, Everett, Wash.—It is reported that the election held on Aug. 24 resulted in favor of issuing \$1,100,000 of 6 per cent utility bonds with which to finance the purchase, or the condemnation and purchase, of the plant of the Everett Water Company, which is owned by the Everett Railway, Light & Water Company.

Gary & Interurban Railroad, Gary, Ind.—The Gary & Interurban Railroad has defaulted on the interest and principal of \$350,000 of 6 per cent notes due on Sept. 1. A protective committee composed of D. H. Gordon, S. Baldwin, Sr., W. K. Cromwell and P. L. Poe is asking for deposits of the defaulted notes with the Baltimore Trust Company as depository. The notes are protected by a deposit of \$500,000 of the first mortgage bonds of the East Chicago Railway, indorsed by the Gary & Interurban Railroad.

Indianapolis Traction & Terminal Company, Indianapolis, Ind.—The Indianapolis Traction Terminal Company showed a deficit during the year ended June 30, 1915, of \$22,865 as compared to \$56,886 for the previous year, according to a report filed with the Indiana Public Service Commission. After deducting the loss for the year, the surplus as of June 30, 1915, was \$292,894. The current deficit was caused in part by the increase in operating costs incident to an increase of wages at the time of the recent strike. Business also fell off to some extent, and the number of passes, especially to policemen and other officials, noticeably increased. The revenues for the current year totaled \$2,889,065 as compared to \$2,902,113 for the year preceding. The total fares were 67,967,954 and the transfers 21,778,673, as compared to 68,257,958 fares and 21,282,858 transfers for the preceding year. Wages to conductors and motormen increased from \$532,347 to \$569,187, and carhouse employees were paid \$69,770, an increase of \$6,495. Claims for damages and injuries for the year amounted to \$115,836. The company spent for construction \$96,168, making the total construction work carried on the books \$11,198,204. Additions to equipment amounted to \$50,527. The income tax increased this last year to \$5,929 as compared to \$3,459 for the previous year.

Kansas City Railway & Light Company, Kansas City, Mo.—The stockholders' committee of the Kansas City Railway & Light Company has in preparation a plan for distributing the equities among the stockholders and separating the railway and light property, as required by Judge Hook's plan, described in the *ELECTRIC RAILWAY JOURNAL* of Aug. 21. G. M. Reynolds, Chicago, is chairman of the committee.

Muskegon Traction & Lighting Company, Muskegon, Mich.—The Muskegon Traction & Lighting Company has applied to the Michigan Railroad Commission for authority to increase its authorized stock from \$700,000 to \$1,000,000. The present stock consists of \$600,000 of common and \$100,000 of preferred issues.

Standard Gas & Electric Company, Chicago, Ill.—The Standard Gas & Electric Company has authorized the offer to stockholders of \$3,750,000 twenty-year 6 per cent notes at 90 and interest. The privilege of subscribing to \$3,000,000 of the notes is accorded holders of the preferred stock to the extent of 25 per cent of their holdings of stock, and the common stockholders may subscribe to the remaining \$750,000. The right of subscription closes on Oct. 15 and the plan will not be declared operative unless \$2,000,000 subscriptions are made. A number of the larger stockholders have pledged themselves to purchase the full allotment. H. M. Bylesby, president, states that the proceeds of the full sale will retire all short time obligations, liquidate the floating debt and enable the company to increase its earnings. It is also stated that in the event of the notes being taken, the preferred stock will be immediately put upon a cash dividend basis, starting with 1 per cent for the first quarter. Since June, 1913, the preferred dividends have been paid in scrip, maturing in about eight years.

Underground Electric Railways, Ltd., London, England.—Further details of the dividend announcement made in the ELECTRIC RAILWAY JOURNAL of Aug. 14 show that the Underground Electric Railways of London was to pay on Sept. 1 or after the interest on its first cumulative income debenture stock, less income tax, at the rate of 6 per cent per annum. As regards the Underground group, the Metropolitan District Railway has declared an interim dividend for the half year ended June 30 on guaranteed stock at the rate of 4 per cent per annum, on the first preference stock at the rate of £4 10s. per annum and on the second preference stock at the rate of 3 per cent per annum. This second preference dividend is the same as for the corresponding half of last year, but compares with a distribution at the rate of 1 per cent per annum for the second half of 1914. The London Electric Railway declared an interim dividend for the half year ended June 30 on the preference stock at the rate of 4 per cent per annum, and on the ordinary shares at the rate of 1 per cent per annum. This ordinary dividend is at the rate paid for the corresponding six months of last year, but for the second half of 1914 the payment was only at the rate of one-fourth of 1 per cent per annum, so that for the full twelve months the dividend was five-eighths of 1 per cent. A third instance of the distribution being restored to the level of the first half of last year is in the case of the City & South London Railway. A year ago the 5 per cent preference stocks of 1891, 1896, 1901 and 1903 received their full six months' dividend and those distributions are now being repeated, but for the second half of 1914 only the two earlier issues received their dividends, nothing being paid on the 1901 and 1903 stocks.

Winnipeg (Man.) Electric Railway.—It is reported that the June returns of the Winnipeg Electric Railway were the most disappointing of any in the last six months. The company's decline in income extends over a full year. The contraction began June, 1914, but it became even greater after the European war started. From a 12.8 per cent decline shown in the January returns, the company has finally come to a 42.6 per cent decline for last June. This follows a 41.2 per cent decline in May and 40.3 per cent in April. Net earnings for six months were \$621,643, being a decrease of \$256,204 or 29.2 per cent. The half year's figures indicate earnings at the rate of \$1,243,286 per annum. This compares with earnings of \$1,685,094 for the year 1914 and \$1,826,088 for 1913.

DIVIDENDS DECLARED

Arkansas Valley Railway, Light & Power Company, Pueblo, Col., quarterly, 1½ per cent, preferred.

Brazilian Traction, Light & Power Company, Ltd., Toronto, Ont., quarterly, 1½ per cent, preferred.

Eastern Power & Light Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

El Paso (Tex.) Electric Company, quarterly, 2¼ per cent, common.

Interborough Consolidated Corporation, New York, N. Y., quarterly, 1½ per cent, preferred.

Interborough Rapid Transit Company, New York, N. Y., 5 per cent.

Manhattan Bridge Three-Cent Line, Brooklyn, N. Y., quarterly, 1½ per cent.

United Traction & Electric Company, Providence, R. I., quarterly, 1½ per cent.

JITNEY JOTTINGS

Ordinance in Newark Before Mayor—Progress of Regulation in Other Cities

The Board of Street & Water Commissioners of Newark, N. J., has passed a jitney ordinance, to take effect immediately, and the measure is now before the Mayor for signature. The measure covers any automobile or other common carrier other than a street car operated within the city for hire at a rate of 15 cents or less. A license to operate must be obtained from the City Clerk. Power is vested with the Board of Street & Water Commissioners to determine the reasonable seating capacity of each jitney, the routes, hours of service and terminal points, and that body is authorized to approve applications as presented or to make such changes in regard to the seating capacity, routes, hours of service, etc., as the convenience and safety of the public may demand. Each holder of a jitney license must take out liability insurance in the sum of \$5,000 within two weeks of the granting of the license. Rules are laid down in detail in regard to operation, among them a provision making it unlawful to omit to operate a jitney over the designated route during the hours of service unless consent has been obtained from the general superintendent of works, subject to the approval of the Board of Street & Water Commissioners. Any person who violates any provision of the ordinance is upon conviction to pay a fine of \$5 for the first offense and \$10 for each subsequent offense, and "any license may be revoked accordingly for violation of the provisions of this ordinance."

The City Council of Newark has passed on first and second reading an ordinance covering the matter of license fees, these fees ranging from \$50 to \$125, according to the seating capacity of the jitney. This ordinance will come up for third and final reading early in October.

An ordinance regulating the jitney in Waterloo, Iowa, has been adopted by the City Council. The ordinance, known as the motor bus ordinance, applies to every motor vehicle, hotel buses excepted, in the city engaged in hauling passengers for hire. Operators of the vehicles must file an indemnity bond payable to any or all persons who may receive injuries while a passenger in their vehicle. The bond is regulated according to the carrying capacity of the vehicle. A \$2,000 bond is required for a vehicle carrying more than one and less than six passengers, driver included; a \$3,500 bond for a vehicle carrying more than six and less than eleven passengers, and a \$5,000 bond where more than ten passengers are carried. The license fee is also regulated according to the carrying capacity of the vehicles. A license fee of \$15 a year is charged a vehicle carrying more than one and less than six passengers, driver included; \$20 where the carrying capacity does not exceed eight; \$25 where the capacity is not more than sixteen passengers; \$30 where the carrying capacity is less than thirty, and \$35 a year where the carrying capacity is more than thirty passengers.

An important jitney hearing was set for Sept. 7 before the Railroad Commission of California in the case of the United Railroads of San Francisco versus the Peninsula Rapid Transit Company. The United Railroads on Aug. 3 filed with the Railroad Commission a complaint against the Peninsula Rapid Transit Company. The company asked the commission to rule that the motor bus company was a public utility, subject to regulation by the commission. The complaint requested that the motor bus company be directed to file with the commission a schedule of rates, fares, charges and classifications, and obtain from the commission a certificate of convenience and necessity, and comply otherwise fully with the public utilities act. The Peninsula company runs motor buses with a capacity of twenty each in regular schedules from San Francisco to Daly City, Milbrae, Easton, Burlingame and San Mateo, the latter point being about 22 miles from San Francisco. The United Railroads claims that the Peninsula Company is a common carrier, but has never secured authority as one from San Francisco, or from San Mateo County, or from any of the cities whose streets it uses. The United Railroads points out that it has invested much capital in rights-

of-way and in building and in maintaining its suburban line between San Mateo and San Francisco, and that it was operating its line long before the motor buses began to run. The United Railroads also claims that it gives an adequate service at all times and there was no necessity for the establishment of the motor bus company.

The question of whether the city of Oakland, Cal., has the right to impose a tax on jitneys, despite previous payment of a State vehicle tax by the jitney owner has been decided in the affirmative by Superior Judges Ogden, Brown and Waste of Alameda County and Conley of Madera, sitting en banc. The judges held that the State taxed the jitney vehicle, but the city taxed the jitney business. The test case was that of Leroy M. Phillips, arrested for non-payment of the \$60 annual tax imposed by the recent Oakland ordinance.

Stringent regulation of the automobile passenger carrying business in Los Angeles, Cal., is proposed in measures now being drafted by the public safety committee of the Los Angeles City Council. Recommendations from Traffic Chief Butler, the Police Commission, and the Public Utilities Board for the new ordinance include requirements that it shall be unlawful for any passenger carrying vehicle to carry passengers on steps or running boards, or for any passenger to sit on the door of an automobile or street car. Some means will also be considered for eliminating the nuisance and congestion resulting from the hundreds of automobiles maintaining street stands for so-called taxicab service. It is suggested that the operators be required to keep their cars in garages or vacant lots and establish telephone call stands in the business district.

All Redlands, Cal., has been divided into four parts and two zones in an effort to fix a scale of prices for the jitney. The trustees of the city found that many complaints had been made of passengers being charged different prices for the same trip. It has been decided that within a radius of 1 mile from the business district a charge of 5 cents shall be made. The second zone covers a radius of 2 miles from the business section. A charge of 10 cents can be made for a trip from the center to a section of one color in the first zone and then to a section of another color in the same zone. For a trip to a section of color in the first zone, then to a section of color in the second zone, calls for 15 cents. Each zone is divided into four colors. The trustees have decided that not only must the jitney men have insurance of \$5,000, but that all automobiles for rent or hire in the city must have the insurance.

Wholesale arrests of jitney drivers have been made at Temple, Tex., on charges of violating the recently enacted ordinance regulating the operation of jitney buses. Few of the drivers complied with the ordinance by providing indemnity bonds of \$5,000 and \$10,000 and payment of a license fee ranging from \$40 to \$100, graduated according to number of passengers carried. The ordinance also requires that cars shall take regular stands for solicitation of business in the down-town section, no solicitation on the streets being permitted. Cars are required to remain at the regularly designated stands until loaded, or until time for the driver to make his trip. He is not allowed to stop to solicit passengers while passing through the business street.

In a decree filed by Judge Ferguson of Common Pleas Court No. 3 in Philadelphia he refused to grant the preliminary injunction sought by the jitney drivers of that city to restrain the enforcement of the recent ordinance, which compels the jitney owners to pay a license fee of \$50 and file a bond of \$2,500. He pointed out that the original injunction granted by Judge Sulzberger in July was vacated on Aug. 7 because of the failure of the members of the Philadelphia Jitney Association to furnish the necessary \$2,500 bond, and expressed the opinion that the jitney men had waited too long to warrant their asking another preliminary hearing. The latter insisted that the failure to file the bond was not the fault of the drivers themselves, but was due to the negligence of their president. If the injunction was now renewed, they said, the bond would be furnished at once. City Solicitor Ryan said he would not consent to a reinstatement of the injunction. He said there had been thirty-six applications to comply with the ordinance and that sixteen operators had entered the necessary bond, paid the license fees and qualified within the terms of the law.

A paper on the subject of jitney ordinances was read by Frank P. Cummings, city solicitor of Williamsport, Pa., at the sixteenth annual convention of the League of Third-Class Cities of Pennsylvania held at Reading recently. No action was taken favoring any special regulations for the jitney, the convention deeming it advisable to await the final result of the litigation over the jitney ordinance in Philadelphia.

COURT EXONERATES MR. DICKSON

Ruling that it would be unreasonable to hold the head of an electric railway responsible for alleged negligence upon the part of a minor employee, when such employee was under the jurisdiction of the head of the particular department in which he happened to work, Magistrate James H. Campbell in Police Court at St. Catharines, Ont., discharged E. J. Dickson, vice-president of the International Railway, Buffalo, N. Y., upon the charge of manslaughter in connection with the Queenstown, Ont., disaster of July 7. In exonerating Mr. Dickson, the magistrate said:

"Mr. Dickson certainly could not be held responsible for any negligence on the part of the crew of the car or the men in the carhouse because each division of the road is under a separate executive head. All possible matters relating to the divisions are dealt with by the executive, but there are some matters which must be left to the men in immediate charge. All the witnesses stated that all the rules regarding safety had been complied with and the car had all the necessary equipment."

Speaking of the construction of the road and the curves on it, the magistrate pointed out plans and specifications of the road had been submitted to the Ontario Railway Board, and no member of the board or anyone else had any suggestions with regard to making the curves safer. The road has been operated for more than a score of years without an accident, and the court held that "the International Railway was perhaps justified in thinking that an accident could not be possible at that point. There is nothing in my mind which would justify me in holding Mr. Dickson for trial and he is discharged."

PETITION FOR ANOTHER FARE INCREASE

The Bay State Street Railway, Boston, Seeks to Establish 6-Cent Fare Unit

P. F. Sullivan, president of the Bay State Street Railway, has notified the Massachusetts Public Service Commission of its intention to establish a 6-cent fare upon all of its lines, beginning on Nov. 1, 1915. In a letter transmitting the proposed schedules of rates in detail, Mr. Sullivan states that the changes proposed cover a general increase from 5 cents to 6 cents as the single cash fare over all the lines; the sale for 50 cents of nine tickets which are to be receivable for fare in Lowell, Lawrence, Haverhill, Salem, Lynn, Saugus, Revere, Chelsea, Malden, Everett, Melrose, Swampscott, Boston, Quincy, Brockton and Fall River; the modification of certain existing and the introduction of certain new fare zones; the modification of transfer privileges, and the withdrawal of reduced fare tickets other than those to be received for the transportation of school children.

In a statement to the press outlining the purposes of its proposed increase in rates the company points out that the general principles recognized in the schedule of fares filed are:

1. A universal cash fare of 6 cents.
2. A reduction by means of tickets in the urban and a portion of the metropolitan territory.
3. A single fare to be charged between centers and within city and town limits, modified in several of the latter to eliminate the present excessively long hauls through sparsely settled territory.
4. A transfer privilege to city or town limits from the centers of adjoining cities or towns upon the additional payment of 2 cents in the metropolitan and a portion of the urban territory.
5. The withdrawal from sale of all workmen's and reduced rate tickets, including the so-called Boston Elevated 8-cent check.

6. The elimination, as far as practicable, of the present overlaps in fare limits and the inequalities occasioned by different collection points for so-called through and local passengers.

The company says that for several years it has appreciated the need of increased income, but postponed the application as long as possible. It is pointed out that the cost of producing transportation for sale has increased to such an extent that the company is, and has been for some time, selling transportation below cost, all of which will be exhaustively shown to the public and the public service commission at hearings and investigations to be given by that body. Nearly 1000 miles of track are involved in the proposed increase.

Reduction in Children's Fares Denied.—The Railroad Commission of Georgia has refused the application filed with it by Judge Morris of Marietta for a reduction in the fares of children by the Atlanta Northern Railway.

Increase in Speed in Everett.—The City Council of Everett Wash., has passed on first and second reading an ordinance amendment providing that street cars may run 20 m.p.h. in thickly populated portions of the city. The old ordinance limited the speed to 15 m.p.h.

Safety-First Movies in Dallas.—The electric street railways of Dallas, Tex., are conducting an educational safety campaign, one of the chief features of which is the exhibition of a moving picture film called "The Dangers of the Street," in one of the most popular theaters of the city.

Experimental Skip-Stops in Milwaukee.—The Milwaukee Electric Railway & Light Company, Milwaukee, Wis., began a three months' trial with skip-stops on its Farwell Avenue, Walnut Street and Greenfield Avenue lines on Sept. 1. All stops eliminated or changed in the outlying districts are indicated by signs. The test was ordered by the Railroad Commission of Wisconsin, and the extension of the plan to other lines will depend on the results obtained on the lines mentioned.

New Railway Publication in Ottawa.—The Ottawa (Ont.) Electric Railway has begun the publication of a bulletin in which it is intended to print important notices posted during the month previous to the issue and to give articles of general interest to those engaged in electric railway service in Ottawa. The first issue of the publication was dated August, 1915. It consists of four pages of reading matter, each 8½ in. by 11 in. In its first issue the bulletin urges efficiency, safety and courtesy. It is planned to issue the bulletin on the twentieth of each month.

Changes in Toronto Suburban Fare.—The Toronto & York Radial Railway, Toronto, Ont., announced that after Sept. 6 the sale of thirty-trip commutation tickets between Sunnyside, Long Branch, New Toronto and the Humber would be discontinued. Passengers may purchase tickets as follows: Stop 10, eight tickets for 25 cents; Stop 25, seven tickets for 25 cents; Stop 29, five tickets for 25 cents. There will be no time limit for the use of these tickets as in the case of commutation books. The new issue of tickets may be purchased on the cars, instead of at the company's office.

Result of Near-Side Vote in Denver.—The Denver (Col.) Tramway held an election on Aug. 23, 24 and 25 at which all passengers were entitled to vote their preference for the far-side or the near-side stop. Ballot boxes were placed near the entrances of the cars, and the conductors gave a ballot to every passenger who paid a cash fare. The count showed 252,586 votes cast during the three days' balloting, 149,692 voting for the far-side stop and 96,226 against it. There were 6668 blank ballots in the boxes. Previous to the vote the Commissioner of Safety of Denver announced his intention of introducing an ordinance to require the company to make near-side stops. Since the vote he has reiterated his intention.

Reduction in Height of Steps Ordered.—The Public Service Commission of Oregon has issued an order requiring the Portland Railway, Light & Power Company to lower its carsteps on its lines between Portland and Oregon City, to 15 in. above the rail, if sufficient clearance on Hawthorne bridge can be obtained, and 16½ in. if the clearance for 15

in. cannot be obtained. While the order is confined only to the cars of the lines mentioned recommendations are made for the adoption of the same standard of construction for all the other cars operated by the company. The complaint about the car steps and about insufficiency of cars on the lines was filed by the Social Service Club of Oak Grove. The commission held the complaint that sufficient cars were not provided was not substantiated. Reconstruction of the steps must commence in thirty days and be completed within a year.

Reduction in Seattle Suburban Fare.—The Puget Sound Electric Railway, a subsidiary of the Puget Sound Traction, Light & Power Company, Seattle, Wash., recently obtained permission to make effective immediately a reduction of 5 per cent in the price of commutation tickets, between Seattle and stations south of Georgetown, to and including Renton. The Public Service Commission ordered commutation rates to and from these stations and Seattle in May, 1914, on a basis of 75 per cent of the first-class cash fares. The reduction to be put into effect now is on the basis of 70 per cent of the first-class cash fare. At the same time the company will make effective, with the commission's consent, the same reduction to and from Tacoma, and stations on the Puyallup line, to and including Puyallup. The rate on this line has been reduced from 1.5 cents a mile to 1.4 cents, on the commutation tickets.

Eliminating Stops in St. Louis.—Fifty-five stops on the Olive and Broadway lines of the United Railways, St. Louis, Mo., were eliminated on Sept. 1 in a thirty-day trial by the company to convince the Missouri Public Service Commission that approximately 800 now made are useless. Large blue signs bearing "No Stop" have been put up at corners and other places where the stops have been done away with. Stops along every division are designated with red signs, "Car Stop." During the trial on the Olive line eighteen stops are to be eliminated on the Delmar division, thirteen on the University and nine on the Maryland. About fifteen stops will be eliminated on the Broadway line. None of the present stops on the Olive line east of Eighteenth Street, on the Broadway line between Clark and Franklin Avenues will be eliminated. Notices were posted in each car on the Broadway and Olive lines, indicating stops made and those eliminated.

Objection to Running Boards on Toronto Cars.—The Toronto (Ont.) Railway was committed for trial by Magistrate Denison on Sept. 2 on a charge of criminal negligence, as the result of operating the running boards on the open street cars. The only evidence taken was that of Alderman Gibbons, business agent of the Railwaymen's Union. He stated that he had served as conductor for eighteen years. He then submitted a list of accidents to conductors resulting from falls from the running board, showing that fourteen occurred this year and nineteen last year. There were four deaths from these accidents. The counsel for the company questioned the witness in regard to the union taking the matter of running boards to the Ontario Railway Board, and said that as a matter of fact the company was experimenting with center aisle cars, with a view to abolishing the running board. The case has been sent to a higher court for trial.

"For a Safer City."—Just before the opening of the Ohio State Fair W. C. Campbell, assistant general superintendent of the Columbus Railway, Power & Light Company, issued a bulletin entitled "For a Safer City." While it was intended to bring about a greater degree of care in the operation of cars during the week that the city was filled with visitors, it contained many other interesting things. It was stated that 42.6 per cent of all the accidents in which the street cars figured during the first seven months of the year resulted from collisions of cars with automobiles and other vehicles. The bulletin said the point had been reached where strenuous efforts must be made to reduce accidents of this class. The company's records showed a substantial reduction in the number of accidents as compared with previous years, and reports of courteous treatment from employees were much more frequent than in the past. These things showed that progress was being made toward that efficiency which all are so much interested in attaining.

Personal Mention

Mr. J. H. Moir has been appointed to the position of traffic manager of the Edmonton (Alta.) Municipal Railway.

Mr. Williston Fish is now vice-president of the West Penn Traction Company, Pittsburgh, Pa., in charge of the operation of the railways of the entire West Penn System. Mr. Fish has relinquished the duties of comptroller.

Mr. Walter C. Slade has been appointed superintendent of power and lines of the Rhode Island Company, Providence, R. I. Mr. Slade was graduated from Brown University and the Massachusetts Institute of Technology and has been associated with the General Electric Company for the last four years.

Mr. Ralph W. Emerson, who has resigned as general superintendent of the New York & North Shore Traction Company, Flushing, N. Y., to become assistant superintendent of the Cleveland (Ohio) Railway, has been presented with a diamond-studded watch fob by the men of the transportation department of the New York & North Shore Traction Company.

Mr. M. R. Bump, who for twelve years has been a member of the Doherty organization, has resigned as chief engineer of the Doherty Operating Company, New York, N. Y., to become vice-president of the Picher Lead Company of Joplin, Mo., a section that he knows well by reason of the engineering and operative work he has done there for the Empire District Electric Company and other Doherty properties.

Mr. Charles A. Russell, Gloucester, Mass., one of the leading members of the Essex County bar, has been nominated a member of the Massachusetts Public Service Commission by Governor Walsh, succeeding Mr. Clinton White, who retired last July on account of age. Mr. Russell was born at Canton, Mass., and was educated at Colby College and Boston University. He was admitted to the Massachusetts bar in 1880. For eight years he was city solicitor of Gloucester and for many years has been prominent in fraternal organizations.

Mr. Frederick Thomas Leversuch has been appointed traffic manager of the London & Port Stanley Railway, London, Ont. Mr. Leversuch was born at Shrewsbury, England, on Nov. 24, 1884, and entered railway service in May, 1905. From that time until June, 1910, he was in the general freight department of the Michigan Central Railroad at St. Thomas, Ont. From June, 1910, to October, 1911, he was assistant agent of the Canadian Pacific Railway at Windsor, Ont. In October, 1911, he was advanced by the Canadian Pacific Railway to the position of freight agent at Windsor and continued in that capacity until December, 1913, when he was made agent for the company at Windsor.

Mr. James J. Callahan, whose appointment as manager of operations of the London & Port Stanley Railway, London, Ont., was announced in the *ELECTRIC RAILWAY JOURNAL* of Aug. 7, was born at New Glasgow, Que., on Feb. 25, 1875. He entered electric railway service on April 27, 1897, as a motorman with the Montreal Park & Island Railway, Montreal, and continued with that company until 1901. From 1901 to 1908 Mr. Callahan was inspector and chief instructor of the Montreal (Que.) Street Railway. During 1908 and 1909 he was chief inspector of the New York & Queens County Railway, Long Island City, N. Y., and since 1909 he has been superintendent of transportation of the Montreal & Southern Counties Railway, Montreal.

Gen. George H. Harries, vice-president of H. M. Byllesby & Company, president of the Louisville Gas & Electric Company, and officer of several other Byllesby enterprises, recently resigned his post as commanding officer of the District of Columbia National Guard. The organization over which he presided for many years presented him with an equipment of his rank (major general) in the presence of the command and more than 10,000 spectators. The gift was made in the name of the guard by Brig.-Gen. Harvey. It consists of a major general's presentation saber, appro-

priately inscribed, a full dress belt, a full dress sash, a gold belt knot and a pair of silver spurs. In his acceptance, General Harries advocated a universal volunteer army for the United States, including the feature of thirty days' military training each year for every able-bodied man between the ages of eighteen and twenty-five.

Mr. F. J. Derge, the present superintendent of the light and power department of the Toledo Railways & Light Company, Toledo, Ohio, and formerly in the New York offices of the engineering department of Henry L. Doherty & Company, has been appointed chief engineer of the Doherty Operating Company, New York, to succeed Mr. M. R. Bump. Mr. Derge was born at Eau Claire, Wis., and is a graduate engineer from the University of Wisconsin. Following the footsteps of other Wisconsin graduates he sought his initial practical experience with Mr. Henry L. Doherty, at the cadet school of the Denver Gas & Electric Light Company. His work at Denver caused him to be chosen for the chief engineership in charge of production at the Massillon Electric & Gas Company, Massillon, Ohio. Later he was called to the Doherty New York offices as a member of the traveling engineering staff. He was made chief engineer of the Trumbull Public Service Company at Warren, Ohio, and when the Toledo property was acquired by the Doherty organization he was moved to Toledo as superintendent of the light and power department.

Mr. Walter N. Polakov was recently appointed to a new office with the New York, New Haven & Hartford Railroad created to handle all matters on the entire system pertaining to the generation of power, heating, lighting, etc., with the superintendent of power as head of the department. Mr. Polakov was born in St. Petersburg, Russia, and received his engineering education and degrees in the Royal Institute of Technology at Dresden, Saxony. Previous to accepting the position of superintendent of power of the New Haven Railroad he was engaged as consulting engineer for the firm of Day & Zimmerman, Philadelphia, managing public utility companies in Pennsylvania, Ohio and other States. Previous to that he was associated with Mr. H. L. Gant in introducing scientific management, and before that held an office as expert consulting engineer for the Board of Estimate & Apportionment of the City of New York, during which time the power plant expenses of the Department of Water Supply, Gas & Electricity were reduced by more than \$500,000 and the operating expenses of the New York municipal ferries were reduced \$117,000 a year.

MENACE SEEN IN M. O. IN SEATTLE

Allen Dale, a member of the Council of Seattle, Wash., has introduced a bill in the City Council urging the abandonment of the city's plans to develop a street railway system. The bill would repeal an ordinance passed by the Council a year ago last May in which provision was made for the sale of \$500,000 of street railway bonds authorized by the voters for the purchase or paralleling of the Seattle, Renton & Southern Railway, and also providing for the issuance and sale of \$500,000 of utility bonds, with principal and interest, payable from the earnings of the street railway system. The plan proposed in the ordinance that Mr. Dale seeks to repeal provides for the construction of a line on Ranier Avenue, from the south city limits at Ryan Street to Dearborn Street, at an estimated cost of \$375,660; the construction of a line on Dearborn Street, from Ranier Avenue to Fourth Avenue South, and on Fourth Avenue south, from Seattle Boulevard to Spokane Street, for a connection with the Lake Burien line, Division C, and the construction of a line on Stewart Street, between Third and Fourth avenues, for a connection with Division A. The whole plan anticipates acquiring common user rights on Fourth Avenue, from the Seattle, Renton & Southern Railway and on Fourth Avenue south, and Spokane Street, from the Puget Sound Traction, Light & Power Company. Mr. Dale claims that the plan involves the expenditure of a larger sum of money than was voted by the people for street railway purposes and that the burden of debt on the taxpayers is now so great that it should not be increased without their specific authorization.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

West End Rapid Transit Company, Cincinnati, Ohio.—Incorporated in Ohio to construct an electric railway from Anderson's Ferry to a point at the intersection of Third and Vine Streets, Cincinnati, its object being to furnish an entrance into the city for the Cincinnati, Lawrenceburg & Aurora Electric Street Railroad. Capital stock, \$10,000. Incorporators: J. C. Hooven, C. E. Hooven, L. E. Voorhies and Stanley Shaffer. [July 24, '15.]

***Aberdeen Railroad, Aberdeen, S. D.**—Incorporated in South Dakota to construct an electric railway. Capital stock, \$250,000. Incorporators: Charles A. Howard, S. C. Hedger and Charles N. Harris.

FRANCHISES

East St. Louis, Ill.—The Rapid Transit Company of Illinois will ask the Council for a franchise to construct tracks through East St. Louis to the free bridge. This is in connection with a project to build a line from East St. Louis to Mount Carmel, via Belleville, 150 miles. Joseph Vonnahme, East St. Louis, is interested. [Aug. 21, '15.]

Andover, Mass.—The Bay State Street Railway has asked the Council for a franchise to alter the location of its tracks on Elm Street and Main Street, Andover.

Utica, N. Y.—The New York State Railways has asked the Council for a franchise to extend its Elm Street line on James Street, Utica. The company has also made application to connect its tracks over the new halfway bridge.

Cleveland, Ohio.—The Cleveland Railway has asked the Council for a franchise to construct an extension on State Road, through Brooklyn township.

North Bend, Ore.—The Southern Pacific Company has asked the Council to extend its franchise through North Bend from thirty years to fifty years.

Portland, Ore.—The United Railways has received a twenty-five-year franchise from the Council to operate freight trains between Portland and Oilton.

Dallas, Tex.—An ordinance revoking the franchise granted to John T. Jones and associates to construct an electric railway on Parry Avenue between Kentucky Street and Henderson Avenue is being considered by the city commissioners. Mr. Jones filed a statement with the commission saying that on account of present conditions he is unable to comply with the terms of the franchise and would therefore relinquish it. [Oct. 3, '14.]

TRACK AND ROADWAY

Fresno (Cal.) Traction Company.—Work has been begun by this company on the extension of its line to Merced and J Streets, Fresno.

Oakland, Antioch & Eastern Railway, Oakland, Cal.—It is reported that this company is considering plans to build an extension to Martinez.

***San Francisco, Cal.**—A 2-mile electrically operated line is to be built by the Mammoth Copper Company, which is building a road to the Friday-Lowden mine from the Mammoth smelter.

San Jose (Cal.) Railroads.—Surveys are being made and work will be begun at once by this company on the construction of its extension on Alum Rock Avenue, San Jose.

Connecticut Company, New Haven, Conn.—This company has agreed to pay \$70,000 toward the construction of a bridge across the river at Stratford Avenue, Bridgeport. It is estimated that the entire cost to the company for relocation of tracks, paving, installation of new wires and overhead work in general in connection with the construction of the bridge will be about \$200,000.

Atlanta & Carolina Railway, Atlanta, Ga.—Proposals to resume work on the proposed railway to connect Atlanta,

Athens and Augusta were submitted to Judge John T. Pendleton on Sept. 1. Attorneys representing the trustees for the bondholders and receiver agreed to give option on the franchise right-of-way and all visible assets of the company to Ohio capitalists for \$150,000. Formal option will be signed by Judge Pendleton and Receiver R. E. Church will turn the option over to Adams & Sturn of Columbus, Ohio, for the purpose of financing the construction of the line. [May 15, '15.]

Galesburg Railway, Lighting & Power Company, Galesburg, Ill.—Residents of the northeast portion of Galesburg are anxious for a line to be extended to that territory. A petition has been drawn up and signed by many residents of that district between Lincoln and Farnham Streets. An extension from the East Galesburg line or from the North Seminary Street line is proposed.

Evansville & New Harmony Traction Company, Evansville, Ind.—Surveys have been made between Evansville and New Harmony, Poseyville, Cynthiana and other towns north of Evansville, while a line from Evansville south to Owensville is projected. [July 10, '15.]

Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind.—In considering the ordinance to compel this company to build an extension of its tracks from Wells Street west on High Street, the Council has decided that High Street is too narrow to allow the building of the proposed line. Accordingly, a new route has been suggested on Second Street to Clark Street, extending west on Third Street. A new ordinance will be drawn up to cover the new route.

***Marion, Ind.**—Plans are being considered to construct an electric railway from Fisher's Station to Marion, via Noblesville, Perkinsville and Elwood. The project is being planned by Indianapolis people who are being backed by English capitalists and citizens of the towns to be benefited.

Muncie & Portland Traction Company, Portland, Ind.—This company is rebalasting its Muncie and Portland line between Portland and Red Key. Twenty thousand new ties will also be used in repairs on this line. This is a correction of an item published in our issue of Aug. 7 in which it was stated that this work was being done by the Union Traction Company of Indiana.

***Burkesville, Ky.**—It is reported that plans are being made to construct an electric railway from Burkesville to Edmonton, about 22 miles. Information may be obtained from the Cumberland Traction Company, which is building a line from Edmonton to Elizabethton.

Bay State Street Railway, Boston, Mass.—Work has been begun by this company laying tracks on Central Square, Lynn.

Boston (Mass.) Elevated Railway.—This company is repairing its outward-bound track from Harvard Square to Porter Square, Cambridge. For the greater part of the distance new rail is being laid and all joints are being welded.

St. Paul (Minn.) Southern Electric Railway.—This company is being urged by residents of St. Paul Park to build a line from Inver Grove across the river to St. Paul Park and northward to Red Rock.

Morris County Traction Company, Morristown, N. J.—Surveys have been begun by this company of the proposed extension of its lines from Landing to Netcong.

New York Municipal Railway Corporation, Brooklyn, N. Y.—The Public Service Commission for the First District of New York has authorized this company to award the contract for the third-tracking of the Broadway elevated railway, Brooklyn, between Myrtle Avenue and Aberdeen Street to the Johnson-Gifford Company at \$400,441.

International Railway, Buffalo, N. Y.—Consents have been received from all abutting property owners for the double-tracking of the line from the switch north of the Lackawanna viaduct on Virgil Avenue to a point 200 ft. west of Virgil Avenue on Kenmore Avenue. When this is completed the Kenmore Avenue line will be double-tracked to the junction of Delaware and Kenmore Avenues, the terminus of the line, with the exception of a short section through the woods south of the Lackawanna viaduct and a few hundred feet on Kenmore Avenue.

Dover, Millersburg & Western Railway, Canal Dover, Ohio.—Plans are being made to begin work on the proposed railway from Canal Dover to Millersburg, via Sugar Creek. F. F. Phillips, Canal Dover, is interested. [April 24, '15.]

Cincinnati (Ohio) Traction Company.—Through Assistant City Solicitor Southworth the city of Cincinnati filed suit in Common Pleas Court on Aug. 30, seeking to condemn property for the purpose of straightening Reading Road and to fix the compensation which must be paid to the owners of property taken. This step was taken to secure a shorter route for the extension of the line to Bond Hill and to secure a location where owners of abutting property will not attempt to prevent the laying of tracks. The owners of property on Reading Road between Paddock Road and Mitchell Avenue have successfully combated all attempts to build a railway on that section of the thoroughfare for more than four years, and numerous suits have been fought through the courts.

Cleveland (Ohio) Railway.—Operation has been begun on this company's extension on East 105th Street, Cleveland, to Garfield Park.

Lake Shore Electric Railway, Cleveland, Ohio.—This company plans to construct a cut-off between Toledo and Cleveland, shortening the distance between the two cities by 5 miles.

Columbus Railway, Power & Light Company, Columbus, Ohio.—At a conference between company and city officials on Sept. 1 the company agreed to lay grooved rails on Long and Main Streets. These streets are to be repaved at once for a goodly portion of their length and the company at the same time will renew its tracks. As much of the work will be done before the advent of cold weather as possible.

Toronto (Ont.) Civic Railway.—Bids are being considered for the rods, plates and special track work on the Lansdowne Avenue extension of the civic car lines.

Toronto Suburban Street Railway, Toronto, Ont.—Construction has been practically completed on this company's extension from Guelph to Toronto and it is expected that operation will soon be begun.

Eastern Pennsylvania Railways, Pottsville, Pa.—About \$216,000 will be spent by this company in improvements made necessary by the building of the new 2-mile extension out Nichols Street, Pottsville, to St. Clair. New machinery at the power house at Palo Alto and additions to the car-house will cost about \$100,000.

Nashville Railway & Light Company, Nashville, Tenn.—This company has completed the construction of its new tracks to the Tennessee State fair grounds.

The Dallas (Tex.) Consolidated Electric Street Railway.—This company is relaying 2410 ft. of double track on Lamar Street between the Texas & Pacific Railway and Cochran Street with 103-lb. girder rails in preparation for the paving of the street. The improvement will cost \$26,000.

SHOPS AND BUILDINGS

Humboldt Transit Company, Eureka, Cal.—This company has purchased a site at the corner of Harris and J Streets, Eureka, for the construction of a new carhouse. The structure will be 240 ft. x 240 ft. and of frame construction, the pits being of concrete. The building will contain a gymnasium for the use of the employees. It is estimated that the carhouse will cost approximately \$3,000.

Waterloo, Cedar Falls & Northern Railway, Waterloo, Iowa.—This company has awarded a contract to the Black Hawk Construction Company to build a freight house 40 ft. x 200 ft. on Utica Street near Mulberry Street. The building will be of steel, brick and concrete construction. It is estimated that the cost will be about \$50,000.

Toronto (Ont.) Civic Railway.—Bids are under consideration by this company for machine-shop equipment at the Danforth Avenue carhouse.

POWER HOUSES AND SUBSTATIONS

Illinois Traction System, Peoria, Ill.—This company has received six new transformers for use in its substation at Fithian. The voltage will soon be raised from 15,000 to 22,000 between Champaign and Danville.

Manufactures and Supplies

ROLLING STOCK

Independence & Monmouth Railroad, Independence, Ore., will probably purchase a combination freight and passenger car and a passenger coach, it being proposed to electrify the line.

Alton, Granite & St. Louis Traction Company, Alton, Ill., advises that the statement published in this paper for Aug. 28 that the company was expecting to purchase new cars to be used between Alton and St. Louis is in error.

Sandwich, Windsor & Amherstburg Railway, Windsor, Ont., has placed with the Preston Car & Coach Company an order for two closed pay cars with a seating capacity of thirty-two passengers each. This company was reported in the *ELECTRIC RAILWAY JOURNAL* of June 19, as expecting to make this purchase.

Toronto (Ont.) Civic Railway has ordered from the Preston Car & Coach Company the four cars for which it was reported in the *ELECTRIC RAILWAY JOURNAL* of June 5 to be in the market. The cars are to be semi-convertible motor cars of the prepayment type, each with a seating capacity of thirty-two passengers.

TRADE NOTES

Root Spring Scraper Company, Kalamazoo, Mich., has recently delivered forty of its No. 2 air-operated scrapers to the Cincinnati Car Company to be installed on cars for the Binghamton (N. Y.) Railway.

Smith-Ward Brake Company, New York, N. Y., announces that Herbert M. Weaver is not in any way connected with the company. Electric railways are asked not to recognize him as a member of this company's staff.

A. L. Whipple, formerly of the Whipple Supply Company, has become associated with the Railway Improvement Company, New York, N. Y., as a special representative in the sales department, with headquarters at the company's executive offices, 61 Broadway.

The J. G. Brill Company, Philadelphia, Pa., is shipping to the Chicago & Milwaukee Electric Railroad fifteen new steel cars on their own wheels. These cars were described last week. The cars will go to Highwood, Ill., over the following route; Philadelphia to Youngstown, Ohio, via Baltimore & Ohio Railroad; Youngstown to Chicago, via Erie Railroad; Chicago to Highwood, via the Chicago & Northwestern Railroad.

United States Steel Corporation, New York, N. Y., and its subsidiary companies received a number of first awards at the Panama Pacific International Exposition. Among the companies which received grand prizes were the Carnegie Steel Company, Illinois Steel Company, Lorain Steel Company, American Bridge Company, American Steel & Wire Company and the National Tube Company. The company also itself received a grand prize and a special gold medal for its exhibit as a whole as being the best, most complete and most effective installation, with a special commendation of the educational value of the exhibit. In the system of awards at the Panama Pacific International Exposition the highest award is the grand prize and but one grand prize is awarded in each class.

Sauvage-Ward Brake Company, Inc., New York, N. Y., has changed its corporate name to the Smith-Ward Brake Company, Inc. The Smith-Ward Brake Company announces that there are no changes in the corporation except the retirement of W. H. Sauvage, who has no further interest in the business of the company. The officers remain as formerly: William S. Scott, president; Frank D. Ward, vice-president; George P. Smith, secretary and treasurer. The executive offices are at 833 Whitehall Building, New York City. The Eastern sales agent is the W. R. Kerschner Company, Inc., 50 Church Street, New York. The southeastern sales agent is J. B. N. Cardoza, Inc., Citizens Bank Building, Norfolk, Va. The business of marketing the S-W brake automatic slack adjusters and other appliances for the electric railway field will be continued.

Esterline Company, Indianapolis, Ind., which manufactures the "Golden Glow" railway headlights, last month

received orders which increased the users of these headlights to one out of every six electric railways in this country. The following properties received "Golden Glow" equipment during August: Gulfport & Mississippi Coast Traction Company; Northern Texas Traction Company; Minneapolis, St. Paul, Rochester & Dubuque Electric Traction Company (Dan Patch Line); Iowa Railway & Light Company; Winona Interurban Railway; Humboldt Transit Company; McGuire-Cummings Manufacturing Company, for new cars of the Wisconsin-Minnesota Light & Power Company; Sheridan Railway; Hattiesburg Traction Company; Jewett Car Company for new cars of the Ohio River Electric Railway & Power Company; New York & Queens County Railway; American Car Company, for new cars of the Beaumont Traction Company; Cincinnati Car Company, for new cars of the Binghamton Railway; Georgia Railway & Power Company; Mahoning & Shenango Railway & Light Company; Denver Tramway; Scranton Railway; Empire United Railway; Pennsylvania Railroad; Windsor, Essex & Lake Shore Railway; Helena Interurban Railway; Southern Car Company, for new cars of the New York & Queens County Railway; Austin Street Railway; Hutchinson Interurban Railway; Savannah Electric Company; Terre Haute, Indianapolis & Eastern Traction Company; East St. Louis, Columbia & Waterloo Railway; Baldwin Locomotive Works, for new locomotive of Du Pont de Nemours Powder Company; Wichita Railroad & Light Company; Electrical Engineering & Purchasing Company, for Trinidad Electric Company; Virginia Railway & Power Company; San Francisco-Oakland Terminal Railways; Philadelphia Lighthouse Department; Iron River, Stanbaugh & Crystal Falls Railway; the Panama Canal; Cleveland, Painesville & Eastern Railroad; United Railways of St. Louis; Topeka Railway; Lowell & Fitchburg Street Railway; Detroit United Railway; Atlantic City & Shore Railroad.

ADVERTISING LITERATURE

Thurman Vacuum Cleaner Company, St. Louis, Mo., has issued bulletin No. 221, bulletin No. 221-A and a reprint from *Clover Leaves* showing the application of the Thurman car cleaning devices to the coaches of the Chicago & Alton Railroad.

American Rolling Mill Company, Middletown, Ohio, has issued a new publication, "Armco Iron Rust Resisting Products," in which are illustrated and described most of the important Armco products as made at the Middletown factory and quite a number of those produced by other manufacturers. The company has also issued a new edition of "Defeating Rust," which covers the inception, development, qualities and uses of Armco iron. "Defeating Rust" has been revised extensively as compared with the edition published a year ago. Armco iron probably made its first bid for fame in culvert form. In "Defeating Rust" considerable space is given to a comprehensive handling of the subject of ingot iron culverts.

NEW PUBLICATION

Engineering Economics. By J. C. L. Fish. McGraw-Hill Book Company, New York, N. Y. 217 pages. Cloth, \$2.

Intended to meet the first needs of students and also to render effective service in office reference work, this publication should succeed in its mission. Its chief value lies in the concise yet ample elucidation of fundamental principles of economic selection (choice based on long-run least cost) which should be thoroughly understood by engineers, but which are too often overlooked in the close application to principles of mechanics and design. After the introductory Part I, Part II treats of the elements of economic selection, such as interest and sinking funds, first cost, salvage value, yearly cost of service and estimating. Part III tells of the principles underlying the comparison of estimates and the determination of the most advantageous choice of project, material or size. Part IV in bibliographical form presents the contents of the most important works that are cited, as well as depreciation and life tables. Part V is a compendium of formulas and tables of values. Carefully arranged and indexed as it is, Mr. Fish's book offers a very fruitful field for the study of basic engineering economics.

ELECTRIC RAILWAY JOURNAL

ANNUAL CONVENTION ISSUE

From San Diego to Vancouver

WHEN a plan for the Pacific Coast convention issue was considered, it was obvious that descriptions of Pacific Coast properties would be expected by the readers. Nevertheless, the *ELECTRIC RAILWAY JOURNAL* has covered these properties so thoroughly in the past that any general descriptions would have meant the unnecessary duplication of much material, and, at best, an issue of unwieldy size.

A second plan would have been an attempt to compare the standards of different companies as regards track, line, power and rolling stock. This, too, would have proved impracticable because the properties are comparatively few for the great extent of territory traversed, and they represent an enormous range of conditions from the cable lines of Seattle, Tacoma and San Francisco to the 1200-volt and 1500-volt heavy traction lines of the Bay Cities and Portland.

A third plan was still available. This was to present articles on whatever matters were of the greatest importance to the properties affected and of probably the greatest interest to the stop-over convention visitor. This plan was adopted with the further improvement that this information was obtained in the form of contributions from the men who have been closest to the questions treated. Furthermore, in this form, the *ELECTRIC RAILWAY JOURNAL* convention issue is a collective invitation

from the men of the Coast to their brethren of the rest of the United States and Canada. This is a fitting place to express the strongest gratitude to the contributors whose co-operation made so personal an issue possible.

The table of contents will reveal discussion of topics in almost every branch of electric railroading. Perhaps the articles of most vital interest are those of Messrs. Lewis, Dunne, Black and Hild on the jitney from the respective standpoints of birth, growth and decline, legal status, financial status and public sentiment. After playing the part of a seven-year locust the jitney seems doomed to a grave unmourned, unhonored and unsung save by the trader in used automobiles. Yet the jitney will leave more than a scar on electric railway finance and operation. Above all, it has shown that all public transportation, car and bus together, should be under one control.

Another set of articles that fall under a common heading are those relating to heavy electric railroading. It will warm the cockles of the electric railway man's heart and warm the cold feet of many a steam railroader to see the Southern Pacific Company operate trains at 1200 volts and 1500 volts direct current as an every-day matter, whether it be on the near-city headways of Los Angeles and the Bay Cities or on the electric passenger and steam freight combination of the Portland divi-

sion. The articles of Messrs. Sears, Hewitt, Johansen, Nichols and Clough indicate emphatically that high-tension d.c. equipment is making good.

That the most advanced ideas in scientific management also find a haven on the Pacific Coast is proved by Mr. Maize's article on work planning at Portland, and Messrs. Sliter's and Cooper's dissertations on schedules. Progressiveness in other branches of the industry is apparent from the remarks of Messrs. Jones and Cashin on front-end fare collection, of Mr. Hinshaw on helping the farmer, of Mr. Schluss on real comparisons of maintenance costs and of Messrs. Alberger and Murrin on the true worth of motormen's checking devices. The three articles on a.c. track-circuit signal practice contributed by Messrs. Vanatta, Miller and Cunningham bring out the ever-increasing reliability of this apparatus; nor does the foregoing enumeration exhaust the list of good things which will be found in this issue.

Finally, a word is in order concerning the two fairs which are responsible for bringing the American Electric Railway Association to the Pacific Coast. At San Diego the visitor will find what has been most truthfully called a Spanish "dream city." It is doubtful, indeed, whether Spain knew greater beauty even at the height of the Moorish power than has been recreated by the modern American. The area of the fair grounds is also small enough to permit everything to be seen in a couple of days provided the visitor does not linger

too long and lovingly over the ravishing displays of California products. The chief railway exhibit at San Diego is by the San Diego Electric Railway, and it's a very good one indeed.

At San Francisco the visitor will find an exposition which will not only attract him at once, but hold him in an ever-increasing thralldom as acquaintance is made with each of its beauties. And, like all others, he will leave with regret that this wonderful art should have been created for less than a year.

Of the technical exhibits, electric railway apparatus forms an important part. It is a pity that all transportation exhibits could not have been placed in one building, for this would have encouraged the exhibit of more detail parts. As it is, the exhibits as described in the *ELECTRIC RAILWAY JOURNAL* for March 13, 1915, are divided between the Palace of Machinery and the Palace of Transportation. Of course, the displays have been made with the view of attracting the general public, but the spatial conditions are so liberal that the technical man will be able to study details even better than at the usual railway convention. Like the regular exhibits of the American Electric Railway Manufacturers' Association, only the latest developments are shown. Unlike preceding world's fairs, the Panama-Pacific International Exposition commemorates an achievement of to-day, and it is therefore consistent that the exhibits should have been planned in the same spirit.

An Electric Railway Paradise

Where Nature's Beauties, an Equable Climate and Rich Soil Are Made Accessible by an Electric Railway Service Which Combines the High Speed of Interurban Operation with a Headway that Approaches City Schedules

By PAUL SHOUP

President Pacific Electric Railway

THE populous section of four southern California counties is served by the Pacific Electric Railway. This garden-like territory, walled in on the north and east by the San Gabriel and San Bernardino mountain ranges, forest-clad on their heights, and rimmed westward and southward with one broad, almost continuous, sandy beach along the Pacific Ocean, has great diversity of attractions for the visitor.

The Pacific Electric Railway, operating 611 road miles and more than 1000 single-track miles, reaches practically every section of this territory. More than a dozen of its interurban lines radiate from Los Angeles. In this section there is not a seaside resort where its lines do not go down the principal aisles of amusement and distribute passengers directly along the sandy beaches.

The forested canyon of Alpine Tavern, with Mount Lowe above, is the mountain terminus of the Pacific Electric Railway, 5000 ft. above the sea.

There is no great citrus fruit growing district in all this section through which the service of the Pacific Electric does not pulsate. Every county seat is connected with every other county seat by its lines, and every populous section has a direct route to Los Angeles and usually to the local business center nearer by. Our lines serve some thirty-five municipalities, and in a third of them we give local in addition to our interurban service.

The private rights-of-way of this railway reach well up into the heart of Los Angeles with the result that the service is not only very frequent but is expeditious.

The great citrus fruit growing districts of south-

ern California lie chiefly along the foothills and in the narrower valleys, though this statement is not wholly comprehensive. From Pasadena eastward, including Sierra Madre, Monrovia, Azusa, Covina, Glendora, San Dimas, Lordsburg, Pomona, Ontario, Uplands, Alta Loma, Etiwanda, Fontana, Rialto, San Bernardino, Highland and Redlands, is a broad belt of almost continuous orange groves, interspersed here and there with lemon groves and vineyards. The valley of Riverside is almost one great orange grove. Southward, the Corona lemon and orange groves have spread from the railway tracks up through the foothills.

In Orange County, the lower mountains wall the beautiful valleys, and here, with Santa Ana and Orange as business centers, are great orchards of citrus fruit and of walnuts.

If visitors should be interested in a citrus fruit valley in the making, there is no journey more educational than that over the Pacific Electric Railway's La Habra line. Here, where a few years ago were the bare plains and foothills, are now several thousand acres of oranges and lemons, all young, and only a small percentage in bearing. What this country will be like may be seen from the Whittier district, a thrifty and prosperous section passed on the way, necessitating only a short side trip.

These territories traversed by the Pacific Electric produce more than 30,000 carloads of oranges and lemons per annum, and this output is steadily increasing.

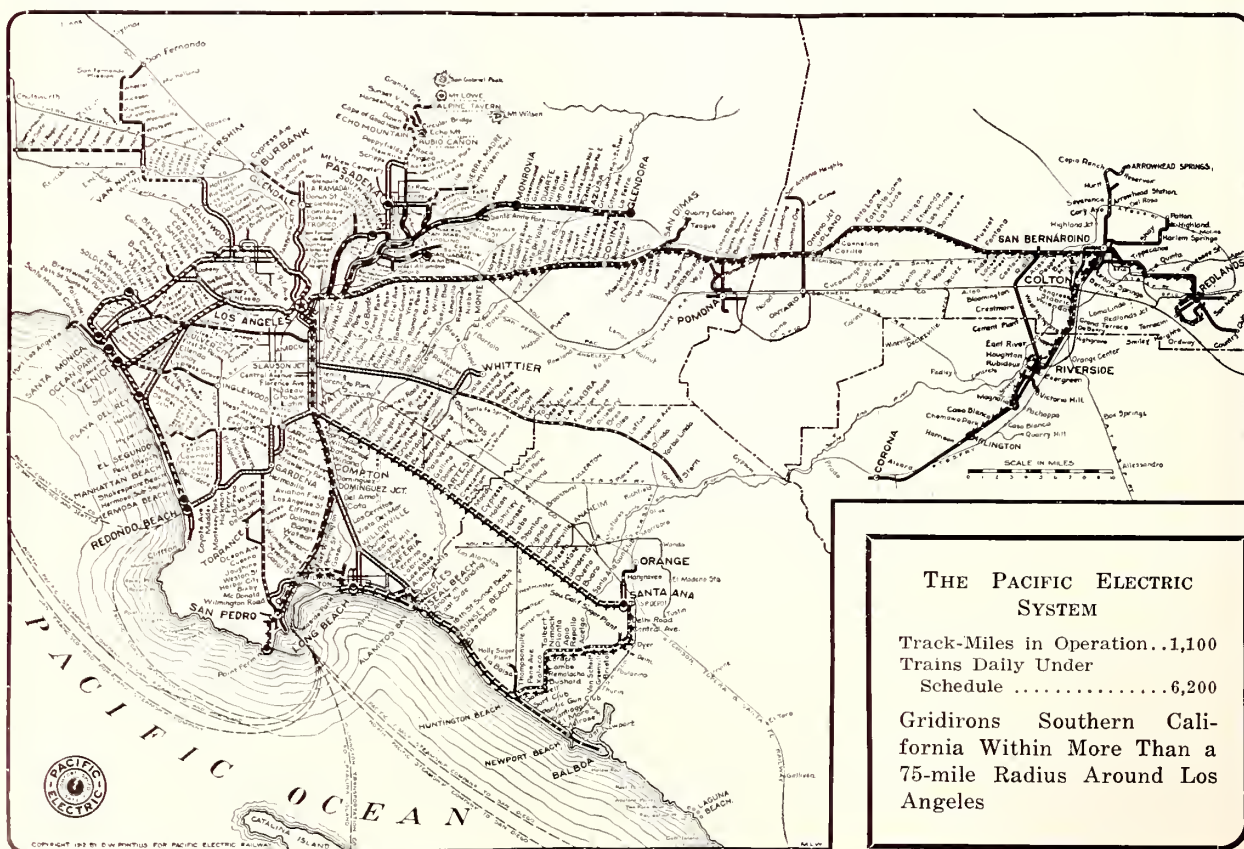

West and south of Santa Ana and Orange is the greatest of sugar beet growing districts, last year's crop being some 250,000 tons. In this comparatively small district are three large beet sugar factories on Pacific Electric lines.

Northward from Los Angeles and separated from the city proper by the Santa Monica mountains is the San Fernando Valley where a grain field of three years ago has been metamorphosed into four thriving towns, a great area of 10, 20 and 40 acres of orchards and vegetable ranches, with many miles of well-macadamized streets, electric lighted, and with every principal section served by the Pacific Electric. The advance of the San Fernando Valley is marvelous, and the towns of Van Nuys, Owensmouth, Lankershim and San Fernando are very interesting to the visitor in that they indicate how rapidly towns may be made. Van Nuys is perhaps the most remarkable example of such creation in the country.

BEACH AMUSEMENT ATTRACTIONS

Southern California, as I have said, offers a great diversity of attractions. Venice, as a seaside resort, has all the play attractions of Coney Island, and the beauty of beach in the fore and of green hills in the background that Coney Island cannot have.

Long Beach, with a hotel unsurpassed so far as I know by any other seaside resort on either coast of the country, is built on an upland and overlooks

Four-Car Passenger Train

the sea. It is claimed that within the due course of time all of Iowa's farming population is planning to retire to Long Beach and enjoy life, and at a meeting of the Iowa State Society in that town you would think this to be true, but the Iowans have no monopoly; there are a great many thousands of other people who know what Long Beach is worth.

What is true of Long Beach and of Venice as to their improvements and their attractions is true likewise of Santa Monica, noted for its upland residences, Redondo Beach, Hermosa Beach, Naples, Alamitos Bay, Seal Beach, Sunset Beach, Huntington Beach, Newport Beach and Balboa. This whole beach country, from Santa Monica on the north to Balboa on the south, is one great playground all summer long. There are no rains and no storms. The weather is invariably pleasant and the bathing unexcelled. At such places as Redondo Beach there is good fishing practically all the time. Every one of these resorts has its merry-go-round attractions, with pleasure piers, and, in nearly every one there are places where good things to eat can be had.

These beach towns are made a part of Los Angeles by a service of trains from fifteen minutes to an hour apart, depending on the distance from Los Angeles. At such points as Venice, Redondo Beach and Long Beach, people hardly consult the timetables, knowing that in any event they will have not long to wait for a train.

AS A WINTER RESORT

The foothill cities of South Pasadena, Pasadena and Alhambra, Sierra Madre, Monrovia, the Hollywood section of Los Angeles, Beverly Hills and other near-by places, are thronged with winter visitors. Here are some of the very best winter resort hotels in America. They are also charming in summer, the green foliage and the white blossoms of the orange trees, the views of the smiling valleys on

the one hand and the snow-capped mountains on the other, and the even temperature of the California winters, giving them their greatest lure when the thermometer in the East is frozen down to its boots.

AS A SUMMER RESORT

Southern California is as much of a summer resort as a winter resort; indeed, I think perhaps more so, and what is said of southern California is likewise true of California as a whole. The mountains, outside of resorts such as Mount Lowe, are not easily accessible in the winter time, but in the summer there are between thirty and forty beautiful mountain canyons, nearly every one with a running stream, readily accessible from the lines of the Pacific Electric Railway. In these canyons are groves of sycamore and oaks, and in their upper stretches and along the hillsides forests of pine and cedar. On the mountain tops themselves and spreading down the northern slopes are large pine forests, now practically all timber reserves. There are public camps and pine log lodges which comfortably entertain visitors, while camping out during the stormless summer season is a favorite vacation experience.

TRANSPORTATION SERVICE

The visitor may go from Los Angeles to San Bernardino in the morning via the Pacific Electric, have luncheon at the latter city, take the connecting automobile stage and dine on the top of the San Bernardino range in a pine forest within a few miles of a mountain lake 6000 ft. above the sea. The next day he may ride among the groves over a road looking down into the San Bernardino and Riverside valleys on the one hand and out upon the desert on the other, from an average height of some 7000 ft., and spend the next afternoon and evening by the side of another mountain lake in the

Flowers and Snow at Smiley Heights, Redlands

Orange Grove, Near Riverside

Bear Valley. Such trips as these are not well known to our visitors, but as time goes on they will increase this lure of southern California.

Perhaps the greatest attraction that southern California has is the near association of wilderness and town, of mountain and sea, of all the advantages that come with conventional and man-made improvements and all the advantage that goes with unspoiled nature in canyon and mountain wall, in islands, such as Santa Catalina, and long unbroken stretches of sea beaches. The Pacific Electric Railway makes these contrasts the more vivid in that through the service rendered by it all points are brought close together.

On the main streets of San Bernardino or Riverside or Santa Ana you may take cars at reasonable intervals during the day for Los Angeles, and, on the main streets of Los Angeles, or, from the business center of the city, you may take cars and return to these same points. There is no city in which it does not have up-town facilities.

The business building which is owned by the Pacific Electric and occupied by it as a terminal in Los Angeles is perhaps the largest business building in the city, and its location is near the business center.

All of these conditions create a situation with respect to city and country development and tending to the unity of the two perhaps not found in quite the same fashion elsewhere. This situation accounts for the 2300 scheduled trains a day of the Pacific Electric and for the fact that it handles some 75,000,000 passengers annually in a residence population of possibly 750,000; and of these by far the greater proportion are, of course, interurban passengers, as only a small part of the railway service of Los Angeles is given by this company.

The business man may, indeed, have his business in Los Angeles and his home in Pasadena, from 11 to 15 miles distant, or in Long Beach, 21 miles away, and reach that home as quickly as if he lived in the immediate suburbs.

It has been the effort of the Pacific Electric Railway to keep up with the growth of southern California and this has necessitated a great deal of pioneering. The system as a whole is, perhaps, yet somewhat in advance of the country. Only recently the isolated sections in the San Bernardino and Riverside valleys have been connected with each other and, in turn, connected with the main system around Los Angeles. The full value of this association and interchange of electric car service over

A Flowered Irrigation Canal at Riverside

Typical Home of a Retired Capitalist

Glenwood Inn, Riverside

Lagoons at Venice

the whole territory served by this company will be fully felt only after some period of experience and development.

A LAND OF OPPORTUNITIES

Business opportunities are all relative, and while it may appear that southern California is at this time fairly well populated, it is altogether probable that no rural section in the United States of equal area is destined to greater increase in population during the next ten years than the territory served by this company. This territory possesses attractions that are almost natural monopolies. It is becoming the playground and the resting place of the world. Income on investments elsewhere is being constantly poured into southern California for the maintenance of people who have in whole or in part retired from business activities. Another stream of wealth comes through the creation of beautiful homes from money realized through the sale of properties elsewhere or from income sources. There may be temporary checks in this development, but the past thirty years indicate that these checks can be but temporary, and they who build wisely and well in southern California need have no fear as to the value of their investments nor any fear

as to dissatisfaction with the conditions that make their new home life approach the ideal.

The wealth of the world is behind this development. This country is more than the playground of the nations—it is the home place of all countries. Where once it was said that one might sit idly at Cairo and in the course of time at this cross-roads of the nations meet everyone whom he knew, it will not be long until this expression will be much more applicable to the city of Los Angeles and southern California generally.

It is, however, more than a tourist land and something else than a home place, but I need say little more in that direction. Los Angeles County was, according to the United States census report recently made public, the first in the United States in the value of agricultural products.

OPERATING FEATURES

The aim of the Pacific Electric Railway is to give with its red cars a service constantly abreast of the demand. We are, working within reasonable business lines, improving our operating conditions wherever new ideas make this soundly practicable. Our grade crossings with steam lines are rapidly being protected by interlocking plants. Our dense

Avalon Bay, Catalina Island

Harbor at San Pedro

traffic lines are protected by block signals and other lines will be so protected when income conditions make it possible. In connection with other Los Angeles city terminals, plans, in part carried out but deferred until business conditions are better, will enhance the advantages to the public in the private right-of-way service now given. All of our most dangerous highway crossings are protected by automatic wigwag signals invented and first manufactured in our Pacific Electric shops. All of our new interurban cars are steel underframed and all cars of recent purchase are of all-steel construction.

Our operating department organization includes a training school with practical instructors thoroughly qualified by experience, and with proper equipment, including a motion picture outfit. Employees in the operating department are required to take physical tests every three years and oral and written examination on the book of rules especially prepared after some months of study and analysis. These examinations primarily are given after a three weeks' course in the training school and on the road, and finally and comprehensively given at the end of a sixty-day term in the school. The Brown

system of discipline is in effect. The same signal test system adopted by many of the steam lines is in effect and rigidly enforced, every operating officer from the general superintendent down being under the necessity of personally conducting tests, which are properly distributed as to divisions, men and rules each month.

With the great number of road crossings and the very large number of automobiles in southern California, the street traffic of various towns and cities to look after, and the many railroad crossings to be guarded against, it has been determined that only thorough qualification of employees and a rigid follow-up system will enable us to maintain our present service in the face of these increasing difficulties to the satisfaction of the public and ourselves and with "safety first" always in our mind.

We want our visitors from the East at the convention in their itineraries to allot enough time to southern California to view it thoroughly. This is a land of hospitality and they will be met with open arms. While, with our sightseeing excursions operated daily a very satisfactory view of southern California may be had in three or four days, yet, if possible, double that time should be allowed.

The Railway on Mount Lowe

Businesslike Methods in Handling Freight by Electric Railroads

Freight Business, Begun by Handling Materials for Building Construction, Now Embraces Every Character of Goods—It Has Been Found Desirable to Handle Express via the Old Line Companies

By J. McMILLAN

General Manager Pacific Electric Railway

Freight Train Approaching Road Crossing

PRIMARILY, the Pacific Electric Railway, like almost all other electric railroads, was designed, constructed, and equipped not for freight handling but for the performance of rapid passenger transportation, or, in other words, for passenger traffic purposes and what might be called the by-products thereof, namely, the handling of such traffic as usually accompanies the passenger business, like United States mail, small packages and express matter.

EARLY DEVELOPMENTS

After the first few years' operation it became quite apparent that the new territory into which the lines had been and were being projected could not develop to the fullest extent without the facilities for bringing into them and to the most convenient points of delivery the necessary materials

and supplies for development and improvement. This, of course, meant the establishment of lumber yards, warehouses, etc., for the supplying of building material, lumber, brick, cement, sand, etc., for the building of residences, store buildings, etc., on the many sites decided upon as suitable locations for stations and towns. To accomplish this much-to-be-desired result, the Pacific Electric Railway began in a small way in the freight traffic business by purchasing a few freight cars when they were found to be necessary for the accommodation of the business strictly local to its own lines. After development of the kind mentioned had taken place, the lands improved and places of business established, it, of course, became necessary to extend the freight handling to the extent of hauling to them the merchants' stores supplies, and then, a little later, to afford transportation to the local markets

for the products of such communities and developed territory. It is plain, therefore, that the Pacific Electric Railway entered into the freight traffic business more from force of necessity, for the purpose of developing its territories and populating the same in order to create a reliable and permanent traffic, rather than from the desire or expectation of profiting from freight hauling.

Therefore, as is made plain by the foregoing, the Pacific Electric Railway's freight traffic, like Topsy, "jes' grewed" during the first four or five years of the company's existence until the extent of it and the question of a more satisfactory manner of handling it became an embarrassing one—embarrassing because the facilities for handling it had not been provided and had not been considered in the first place as a contingency to be very amply provided for. Fortunately, the projectors, who were the owners, had the foresight to secure, in most instances, ample rights-of-way and station ground facilities. Possibly this came more as the result of previous experience in the construction and equipment of steam railroads, therefore somewhat of a habit, than from foreseeing that the same would later be necessary for anything like a satisfactory provision for freight traffic handling. As a result of this situation, when it had become quite apparent that the Pacific Electric Railway must be a "regular" railroad for handling all kinds of traffic possible to be handled by any kind of a railroad, and many kinds possibly not handled by most railroads as freight shipments, the company began paying more attention to the freight and express features of its traffic and providing proper facilities in the way of rolling stock and power equipment and stations suitable for such traffic. Then the realization that the builders had built wisely in the securing of station and terminal grounds began to be quite apparent to the road's operating officers, and it was then they commenced to build regular station structures and to provide the necessary station and terminal trackage for the accommodation of the freight traffic.

However, like the fellow who bought the set of harness at auction, then had to buy a horse to fit the harness and then a buggy to fit the horse, and then build roads around the farm over which to use his acquisitions, the question of providing for the handling of through shipments of both freight and express matter was unsettled; that is to say, the handling of matter coming from and going to points beyond its own lines and in many instances interstate shipments. The reason was that as the communities were developed and started along the lines, and the products became more than the local markets could take care of, more distant markets were sought and in return, of course, more distant sources of supplies of merchandise sought

these local markets which wanted their goods possibly as much as the more distant markets wanted the local products.

As the steam railroads had not joined in through rates and the interchange of traffic and freight equipment, it was, of course, necessary to move all through freight shipments, both carload and less than carload, by making the rates by the combination of locals; in other words, the rates of both or all the lines handling the same, and to transfer the shipments at what are now called interchange points. This same condition prevailed in the handling of express matter, as the Pacific Electric Railway for several years was operating its own express company, known as the "Pacific Electric Express." These conditions, involving the combination of the rates of two or more lines and the rehandling of through freight shipments coming from and going to the Pacific Electric Railway's local stations, placed a heavy handicap on the merchants or industries located exclusively on the electric railroad. This handicap, however, was, a little later on, made somewhat lighter as to the rehandling of through shipments by means of a limited arrangement whereby the connecting steam railroads agreed to allow their freight cars, and foreign line cars in their possession, to be loaded solidly; that is, in commodity carload lots, to go to their destinations on the Pacific Electric Railway's lines, not competitive with the steam railroads, for delivery.

They also agreed that where back-loading was offered to accept the cars back in the same manner; namely, on the combination of local rates. The electric railroad agreed to pay demurrage charges on the steam road's equipment just as would be charged a merchant or shipper for cars delivered to industry or private service tracks. This condition prevailed up to about two years ago, the higher rates due to the combination of locals still acting as a handicap to a large extent against the electric railroad's freight traffic, and being, of course, a handicap to just that extent upon the electric railroad's shippers or the shippers located thereon having to make or receive shipments to and from points beyond the rails of the electric railroad.

FREE INTERCHANGE OF TRAFFIC WITH STEAM RAILROADS

All these handicaps upon the company's freight traffic and against the free interchange of traffic with steam railroads were removed about two years ago by the good old Southern Pacific coming to our relief with a liberal freight interchange arrangement and the application of through rates, both State and interstate, to and from all stations on the Pacific Electric's lines. Since then, this electric road's freight business has grown quite rapidly.

Evidence of this increase in the electric freight traffic is found in the figures which show that for the first ten months of the fiscal year 1914-1915 the freight tonnage for the system increased 22 per cent over the same period of the previous fiscal year, 1913-1914.

Notwithstanding this, the fact, and the evidence thereof, still remain that the Pacific Electric Railway was designed to serve and does serve the public as a high-class rapid-transit passenger carrying line, because its freight traffic, even after all the development described, amounts now to only 13 per cent of its gross earnings.

FREIGHT HANDLING EQUIPMENT

Another evidence of wise building, or provision, is the fact that in the acquisition of freight equipment, the Pacific Electric Railway has, from practically the very beginning of its provisions for handling freight, purchased and provided standard freight equipment of the same type and equal in quality to the freight equipment of any steam railroad, and superior to that of many steam roads. At this time the company owns 223 box cars, of which ninety are of 100,000-lb. capacity, the rest varying from 80,000-lb. capacity down to 40,000-lb. capacity; 349 flat cars, of which 212 are of 100,000-lb. capacity; 454 gondola cars, of which 250 are of 100,000-lb. capacity, 100 of the latter being of steel construction throughout; thirty-one oil tank

cars; ten standard 80,000-lb. capacity stock cars, or a total of 1149 freight cars that are of standard construction and are interchangeable with those of standard steam railroads; twenty-six express and express-freight cars, and eighteen combination express-passenger cars. This does not, of course include any equipment that is assigned for the exclusive use of the construction and maintenance of way departments, such as tool cars, line cars, wreckers, etc.

All freight equipment is handled over our own lines by electric locomotives, of which there are eleven 1601-class which weigh approximately 65 tons, and have a tonnage rating of approximately 1400 tons; sixteen 1550-class which weigh approximately 50 tons and have a tonnage rating of approximately 800 tons, and twelve work-train-type locomotives, which are put in freight service and switching service where necessary to help out in heavy movements. Six locomotives of class 1550 have General Electric equipment; all the other locomotives have Westinghouse equipment. In addition, the express-freight type of express car is so flexible, having a loading capacity of 40 tons of freight inside, that it can serve as a locomotive in moving carload shipments between local stations, as well as distributing carload shipments where the emergency requires it and bringing in carload shipments of perishable freight, fruits, berries, vegetables, etc. It has a train-pulling capacity of from eight to ten loaded cars.

Pacific Electric Locomotive, Type 1600, 1000 Hp., Built Ten Years Ago and Still Doing Good Service

The Freight-House Force at the Los Angeles Station of the Pacific Electric Railway

There is considerable satisfaction in the fact that when interchange with steam railroads did come about we encountered no handicap worthy of note on the freight car equipment feature of the business.

Regarding the express business: I should have explained that on account of the handicap on that business coming from and going to far-distant points because of the combination of the two rates, the lack of ample free delivery facilities, extended free delivery limits, etc., it

was deemed the better policy, both for the benefit of the Pacific Electric and the public patronizing it, to make an arrangement with an old-line express company. Such an arrangement was made with Wells Fargo & Company, some eight years or more ago, by which that company operates over the entire system, even into and out of what might be called rural districts and under which through rates are applied to and from all Pacific Electric Railway points the same as to and from all steam railroad points on roads operated by regular express companies. Hence, where patrons had formerly to pay the rate to and from Los Angeles, plus the local express rate between Los Angeles and the destination or shipping point on the Pacific Electric Railway, they now pay only the one rate between the points of origin and destination, in most instances saving entirely what was formerly the electric railroad's local express rate. Notwithstanding this saving to the shipper,

the electric railroad derives more net revenue from the express business than it did under its local rates and handling. In addition to handling the express business in straight express cars with messengers over lines supporting heavier express traffic, a large amount of this business is handled in connection with passenger service in the express compartment of combination express-passenger cars.

The most difficult part of the electric railroad's freight business has

been to overcome what seems to have been and is yet to some extent the opinion of shippers generally that it costs electric roads nothing to handle freight traffic. In fact, the general idea seems to have prevailed throughout the country that electric railroads are built and operated for the purpose of reducing rates. It can be said to the credit of the Pacific Electric Railway that it has never, since its beginning as a railroad, been a rate-cutter, rebater, or demoralizer in any sense of the word. It is true that its rates generally are very low, but they have been made so only to meet conditions; that is, the established rates of other lines into competitive territory as such existed at the time of the opening of the electric railroad for operation, or as the rates were made by the steam railroads at about the time this electric railroad entered the field, or since.

The company's management has tried to follow the policy that "the servant is worthy of his hire," and as its service is of the very best there is no

Pacific Electric Locomotive, Type 1601, Showing an Example of a Purchased and Later Design

Express Transfer Between Pacific Electric and Southern Pacific Steam Cars at Wells Fargo Station, Los Angeles

reason why it should not receive as much compensation therefor as any other railroad receives for similar service. It has been and is still the policy of the company to give the best service possible for the compensation received. We know that some electric railroads in some parts of the country have made themselves, as well as all other electric railroads, unpopular with the established steam railroads by following unfair methods in securing and handling freight in an irregular way and by scalping the steam road's rates between competitive points by taking local shipments, packing cases, boxes, packages, etc., between such points, particularly from jobbing centers, into the country on the platforms or inside of their passenger cars and thus distributing to country and village stores along the line at almost any old rate.

On a trip east some four years ago, in riding over the electric roads, I noticed this being done by an electric interurban road in a State and from a city it is not necessary to name. Upon visiting the local manager to see at what rates his road was doing such business, and thinking from the way it was being handled his road was receiving not less, and possibly more, than the express company's rates, I was surprised to learn that such shipments were being handled at much less than the steam railroad's freight rates, which, the Lord knows, were too low even for old-established steam railroads to make any money.

EFFECT OF UNFAIR PRACTICES

To my mind it is just such practices as these on the part of some electric railroads, of which the foregoing is only one example, that have made the established steam railroads loath to recognize electric railroads as freight carriers and to enter into traffic interchange relations with them. Really, it is hard for an unprejudiced railroad officer to see how they could be expected to do so until the electric railroads shall have ceased their haphazard and what might be called disreputable practices and begin doing a freight traffic business on a business basis. My own views are and have been for some time on the same principle; that is, that we are all supposed to pay willingly for what we get. The Pacific Electric Railway or any other electric railroad performing as high-class service should receive a somewhat higher rate for its service, and particularly its freight service, which is, as a matter of fact, practically express service at freight rates. About the only difference between this and express service is the free pick-up and delivery which is performed by express companies and which we all know is, of course, quite an item of expense to freight shippers in the forwarding and receiving of freight shipments.

It might be said by those unfamiliar with the

conditions that this is wrong and possibly unnecessarily extravagant handling and dispatch of freight traffic, but with the Pacific Electric Railway it is a case of necessity; for on account of the passenger train units being so frequent and fast, it is necessary when the freight leaves the terminal and gets out onto the lines to move it quickly between stations and handle it quickly at stations to keep it out of the way of passenger cars and trains. Unfamiliarity with these conditions has been the cause of much adverse criticism from some sources that the electric roads' freight service is thought to be unnecessarily extravagant, as well as unfair to old-established steam railroads. Nevertheless, it is hard to see how an electric railroad, the Pacific Electric in particular, could handle the business with any degree of satisfaction to itself as well as to the public in any other way than the way in which it is being handled. As a general proposition, this company's freight traffic is solicited, receipted for, handled, way-billed, loaded, shipped, and delivered in the same manner as such business is handled by the best regular steam railroads, with the possible exception of somewhat closer attention to details and dispatch in loading, moving over the lines and unloading at destination, due to a large extent to the nature of the business. In short, all connected with the business naturally become somewhat electric (quicker) in their habits and movements, as well as the necessities of the situation already explained. However, it is largely due to the compactness of the property and the advantage in this respect which the managing officers have in keeping their fingers on the pulse of the lines at all times.

EXPEDITIOUS SERVICE

I have been told by the manager of the Pacific Car Demurrage Bureau that the Pacific Electric Railway's records for the prompt movement of and low detention to freight cars excel those of any other member of the bureau. This fact is due, no doubt, to reasons already explained combined with the close attention to detail and alertness of the car service department; also, to its facilities for keeping in close touch by telephone with the handling of rolling equipment at every point on the system.

As far as possible, however, freight traffic moved in trains drawn by locomotives is moved at night. The reasons for this are obvious to electric railroad operating officers; first, because such trains are, of course, slower than passenger trains, the latter are fewer and farther apart at night, and the freights have more opportunity to get over the lines from station to station without delaying passenger cars and trains; and, second, the night power supply, purchased from hydroelectric companies, besides being adequate in amount for

heavy motor movements is much lower in cost. It is still questionable in my mind whether heavy freight train service can be performed at a profit during heavy passenger traffic hours, particularly during peak-load conditions with power at the cost of that used for passenger transportation purposes.

PACKAGE FREIGHT BUSINESS

It is, of course, necessary to perform what we call "package freight" service; to wit, small, less than carload, shipments of merchandise, a large portion of which has to be delivered at prepay stations, non-agency points, highway crossings, country stores, etc., during daylight hours to avoid the same being stolen or damaged by the weather were it left at such points at night. Such shipments are generally handled in what we call "express-freight" cars, one, two, or three cars per train, according to volume of business, by two trips daily over most of the lines, one in the forenoon and one in the afternoon over the heavier traffic lines, and one such trip starting out in the early forenoon over the lighter traffic lines. Generally, these same cars return to Los Angeles loaded with milk, cream, and package shipments of berries, vegetables, etc., for the Los Angeles markets, the empty cans and crates being taken out and distributed on the outbound trips of such cars and trains. On some lines, however, the milk traffic is of such volume that some runs of such cars are classified as strictly milk trains and are in that service exclusively, returning the empty cans to their many points of loading on the outbound trips. Freight delivered in the forenoon is forwarded on the afternoon trip, and is generally in the consignee's hands the same afternoon or evening; that delivered during the afternoon and

evening is forwarded on the next morning's trip of such distributing cars and is delivered to consignees before noon the day following its delivery for shipment to the freight station in Los Angeles. These express-freight distributing cars also carry what is commonly called less-than-carload perishable freight, such as the daily supply of fresh milk, ice cream, fresh meats, fresh fruits, vegetables, etc., from the larger markets in Los Angeles for the daily supply for the larger outlying cities, particularly the beach towns and cities, such as Long Beach, Venice, Santa Monica, and the various ocean and mountain resorts served by these lines. Heavy or imperishable shipments of less-than-carload merchandise received at the Los Angeles freight station during the day is, as far as possible, loaded into separate cars for the larger cities and towns like Long Beach, San Pedro, Santa Ana, Huntington Beach, Covina, Monrovia, Pomona, San Bernardino, and Riverside, thus reducing to the minimum the handling and distribution of less-than-carload shipments by crews on the night freight trains. Where there is sufficient of such shipments to fill a car or cars for a town, the cars are sealed at Los Angeles, sent out in the night freight trains and placed at destinations ready for unloading by the station force the first thing in the morning, so that consignees may secure the goods in time for that day's business.

It is, no doubt, this kind of service, to some extent necessitated by electric railroad exigencies, that causes the local merchants and shippers generally along the electric lines, even at points strongly competitive with one or more steam roads, greatly to prefer the electric railroad's freight service over that of the steam roads.

New All-Steel Passenger Cars for the Pacific Electric Railway

A Description of the All-Steel Cars Just Delivered, Including Some Safety-First Braking Features, Modern Lighting, Etc., Is Given

By FRED F. SMALL

Mechanical Superintendent Pacific Electric Railway

THE following is a brief description of our twenty-four new all-steel passenger cars built for the 63-mile run on the 600-1200 volt d.c., Los Angeles-San Bernardino line, of the Pacific Electric Railway.

The car bodies and trucks were designed by the railway company and built by the Pressed Steel Car Company, McKees Rocks, Pa. In designing both car bodies and trucks the railway has kept the safety-first question constantly before it, and with that primary object in view has decided that the cars hereinafter described fulfill all requirements as to safety, speed and comfort to its patrons. No attempt has been made to reduce the weight of material required in the construction of these cars. They have simply been built strong and substantial and in keeping with the high-class passenger service for which they are intended.

The general dimensions of the cars are shown in the accompanying table.

CAR BODY

The underframe consists of two 7-in. 15-lb. I-beam center sills and 6-in. x 3½-in. x ⅜-in. angle-iron side sills. The ends of the sills are securely riveted to combination bolster and platform steel castings furnished by the Commonwealth Steel Company. The sills are tied together by means of 4-in. 5.25-lb. channels which serve as bridgings to support the flooring. In addition to cross bridgings there are two cross-ties each consisting of two ½-in. x 5-in. plates, one plate passing directly over the center sills and the other extending directly underneath them.

Cross-ties are located symmetrically near the center of the car and are spaced approximately 11

ft. They are securely riveted to the top and bottom of the center sills, and are brought together at the side sills to which they are fastened by means of suitable plate gussets. These cross-ties serve to support the weight of the center sills and flooring, and transfer the same to the side framing. As applied to sills they project but little below them and offer no obstruction or hindrance to piping and equipment applied to the bottom of the cars. The arrangement of cross-ties and bridgings as well as the spacing of sills is shown on the cross-section and on the general plan drawings on page 491. The two car types are the same except that one has a 14-ft. express compartment.

The body side framing consists of 3-in. x 3-in. x 5/16-in. to ¼-in. 5.5-lb. tees securely riveted to the side sills at the bottom, and to 3½-in. x 3½-in. x 5/16-in. side plate angles at the top.

The belt rails consist of a 3½-in. x 1-in. x ⅜-in. dropper bar extending in one continuous length between the body corner posts. The side sheets and the letterboard are of ⅛-in. steel. The carlines are of 2½-in. x 1½-in. x ¼-in. angles securely riveted at the ends to the side plate angles. Roof sheets are of 3/32-in. steel.

The flooring is of Flexolith laid on Keystone galvanized steel floor sheets. A layer of ¾-in. magnesite is applied below flooring for insulation. The floor in the aisle is covered with a "Wearproof" mat extending the full length of the car between the body end doors.

INTERIOR FINISH

The cars are finished inside in mahogany and the ceiling and wainscoting are of ¼-in. Agasote. Light wood furring is fastened to the side posts and carlines to afford means of fastening the Agasote and the mahogany inside finish. The inside of the roof sheets and side sheets is lined with three-ply Salamander hair-felt insulation in order to afford protection against very high or low temperatures.

Each regular passenger coach is equipped with two toilets located diagonally opposite, one at each end of the car. The toilets are equipped with white metal wash basins and Duner water closets for use with air pressure water supply. The toilet room fixtures are Adams & Westlake manufacture. Cars

Gage	4 ft. 8½ in.
Length over end sills	47 ft. 2 in.
Length over buffers	58 ft. 1 in.
Length over pulling face of coupler	59 ft. 7 in.
Bolster centers	34 ft. 0 in.
Width over side sills	9 ft. 2 in.
Width over all at eaves	9 ft. 4¼ in.
Width inside in the clear	8 ft. 7¼ in.
Height floor to ceiling	8 ft. 6 3/16 in.
Height rail to bottom of sills	3 ft. 7¾ in.
Height rail to top of platform	4 ft. 4 in.
Height rail to top of roof	13 ft. 1 11/16 in.
Wheelbase of trucks	7 ft.
Weight of car body (without equipment) estimated	50,000 lb.
Weight of two trucks (without motors) estimated	29,000 lb.
Weight of car completely equipped, estimated	108,000 lb.
Seating capacity	60

Body Frame of All-Steel Passenger Car for the Pacific Electric Railway

are equipped with continuous basket racks. The racks are enameled mahogany color to harmonize with the interior finish. The cars are also equipped with Automatic ventilators.

PLATFORM ARRANGEMENT

The arrangement of platforms and folding cabs is shown. The Dean end-post construction has been applied to these cars, and this, in conjunction with solid cast-steel platforms, affords an excellent protection to passengers as a means of preventing telescoping. The body and vestibule end posts consist of two 14.75-lb. I-beams each bent into a "U" and inserted through holes in the platform steel castings. In addition to the special heavy Dean end-post construction, the cars are equipped with Rico anti-climbers, which add further protection against liability of telescoping. An oak block is applied directly behind the Rico anti-climbers to serve as a cushion. In the event of possible collision it is considered that these blocks will be crushed and absorb most of the impact, thus relieving the platform and framing from unusually severe shock. The platforms are equipped with O. M. Edwards all-steel trapdoors. The rest of the platform flooring, including step treads, is covered with Mason safety carborundum tread. Stationary steel pilots and Eclipse fenders are also used on these cars.

On account of the short radius curves (45 ft. radius) around which it is necessary to operate these

cars in trains it was not considered practicable to attempt to apply vestibule diaphragms between cars.

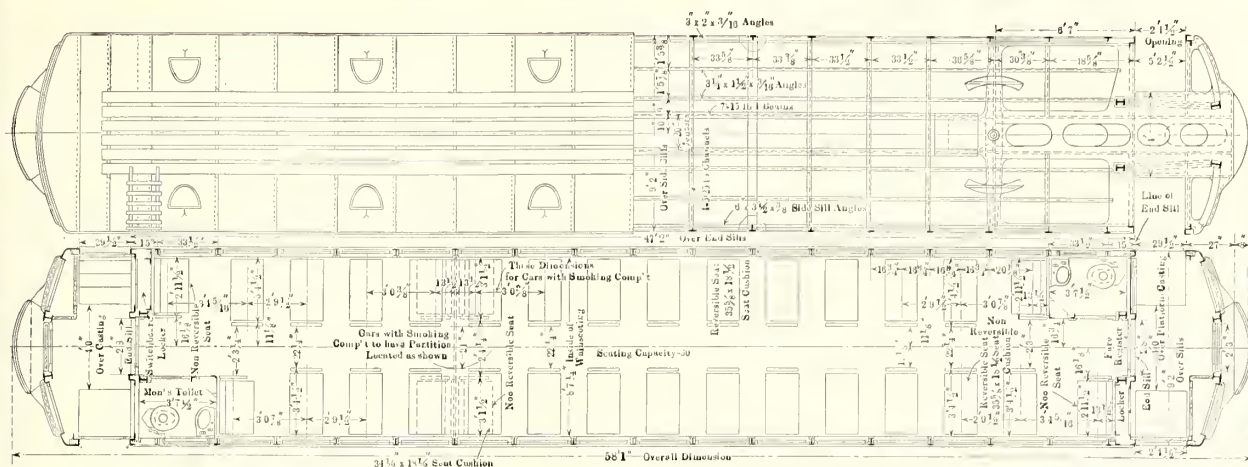

The Westinghouse Air Brake Company's combined car, air and electric couplers are used. These couplers not only serve as a mechanical connection between cars but at the same time make all air-pipe and electrical connections required between cars, thus doing away with air hose and electric jumper cables between cars, as well as the necessity for trainmen to go between cars when making up trains, or cutting off cars. It may be noted that the maximum swing of the couplers when the cars are coupled together and rounding a 45-ft. radius curve is 60 deg. from the center line of the car. On account of this wide coupler swing it is considered that quite an appreciable saving in maintenance will be effected by eliminating air-hose and electric cable connections between the cars.

The cars are equipped with Hale & Kilburn walk-over seats with foot rests and mahogany square-post arm rests. The seat backs are provided with head rolls, bronze grab handles and ticket holders. These seats are spaced 33 $\frac{3}{4}$ -in. centers to give comfortable seating. They are upholstered in crimson mohair plush, the standard upholstering material on all cars of the Pacific Electric Railway.

The curtains are of Pantasote and are equipped with the Curtain Supply Company's ring fixtures. The body sashes are of mahogany and are equipped with O. M. Edwards sash locks and compression

rollers. Other body equipment includes Ohmer fare registers, Hunter illuminated destination signs and bronze, nickel-plated car trimmings.

TRUCKS

The trucks are of the built-up, double-equalizer swing bolster type with bolsters of cast steel and elliptic springs of sufficient length to possess good riding qualities. These trucks have 36-in. rolled steel wheels, 6½-in. A. E. R. A. Standard vanadium steel axles, 5-in. x 9-in. Symington journal boxes, Baltimore ball-bearing center plates, Woods roller side bearings and Harrison dust guards.

The pedestals of this equipment are provided with channel-shaped steel wearing gibs. Provision is made for raising up cars by the application of shims under swing hanger axle bearings, thus doing away with the necessity of disturbing the adjustment of the side bearing and center plate heights. The bolster chafing plates are arranged so that they may be renewed without removing the bolster from the truck. Case-hardened steel brake pins are used with case-hardened steel bushings.

ELECTRICAL EQUIPMENT

All cars are motor cars arranged for double-end operation. Each car is equipped with four General Electric 254-A, 150-hp. motors with the same maker's control, for either 600 or 1200-volt d.c. lines. The master controllers are equipped with emergency air-brake attachment. The change-over or commutating switch, by means of which proper connections are made for either 600-volt or 1200-volt lines, is operated by air and remotely controlled by the motorman. Suitable relays and protective devices are provided to prevent possible trouble due to any attempt to make 600-volt line connections while on 1200-volt line.

With the gear ratio applied cars are capable of a speed of 60 m.p.h. Each car is equipped with two of this railway's standard pneumatic trolley bases, 12-ft. trolley poles and No. 23 Kalamazoo trolley wheels and harps. The trolley bases are manufactured in our own shops. They are self-retrieving by means of air pressure. Trolley retrievers, therefore, are not required. "Ideal" trolley catchers are used to take care of the trolley rope.

LIGHTING AND HEATING

The lighting system consists of a single row of eight 56-watt Mazda lamps equally spaced along the center line of the ceiling. Each lamp is equipped with the Safety Car Heating & Lighting Company's brass nickel-plated shade holder fitted with holophane reflector. This arrangement when taken in connection with the ecru-colored oval-shaped ceiling, gives an excellent lighting system with ample intensity of light throughout the entire car. The

platforms are lighted by means of dome lamps located directly over each stepway. To avoid interference with the motorman's vision these lamps are transferred to the destination sign on the operating end of the car. Step lights are located one at each corner of the car for the convenience of passengers boarding or leaving. For headlight service we use the 4-amp. portable combination Crouse-Hinds type L.A.A. luminous arc and incandescent headlights, with independent resistance.

Each car is equipped with twelve 500-watt, 1200-volt heaters of the truss-plank type, manufactured by the Consolidated Car Heating Company. The heaters are arranged for operating twelve in series on 1200 volts with suitable connections to the change-over switch for changing to two groups of six in series on 600 volts.

BRAKES

The cars are equipped with the Westinghouse Air Brake Company's latest improved Universal, quick-action, high-pressure, automatic, air-brake equipments. Air pressure is furnished by means of a Westinghouse dynamotor compressor having a displacement of 35 cu. ft. An automatic control switch is inserted in the cable which furnishes current to the controller. This control switch remains open-circuited until the compressor has raised the air in the main reservoir to a certain pressure. By means of this simple device it is impossible to start the car in the usual way by any movement of the controller until the air pressure has been raised a predetermined amount considered sufficient for the proper operation of the air-brake equipment. This is a safety feature and prevents any movement of the car without the air pressure required to stop it. A spring by-pass switch is located in the motorman's cab to short-circuit this device, and when held closed by the motorman it enables the car to be moved without air pressure. This is installed to permit the cars to be run out of the carhouse, as in case of fire, without waiting for cars to pump up the air pressure required to close the automatic control switch.

In addition to these improved air brakes, the cars are also equipped with the St. Louis Car Company's "high power" pilot-wheel hand brake.

CONCLUSION

Without attempting to go into any long and tedious description of the cars the writer has attempted to show that the Pacific Electric Railway has spared no expense to obtain cars consistent with the best engineering design and practice. Much attention has been given to make the cars comfortable and easy riding, and I have no doubt that they will meet all requirements and be in keeping with the high-class interurban service for which they are intended.

Interior of Center-Entrance Car at Platform

Standardization of Twelve Car Types into Two at Los Angeles

One Truck Is Used for All Car Equipment, Whether of End or Center-Entrance, Passenger or Service, Two-Motor or Four-Motor Type

By E. L. STEPHENS

Master Mechanic Los Angeles Railway

STANDARDIZATION is that one appalling word which is written largely on the page of every activity. In its true sense it means efficiency. Conditions may be standardized in two ways: First, by bringing your present conditions to a high state of efficiency; and, second, by making complete changes in all conditions. As standardized conditions underlie the best results from all other principles, they therefore accelerate the

progress of efficiency and make work quicker and easier. The conditions that govern efficiency are quantity, quality and economy.

While standardization could be brought about by discarding all equipment and purchasing a new standard, there are few companies which could undertake such a radical change, no matter how valuable the ultimate results might be. Therefore it would appear that the practical solution is that

Standard Center-Entrance, Pay-As-You-Enter Car, Los Angeles Railway

standardization should be gradual for both maintenance and for new equipment. This system involves no great extra expense and, at the same time, accomplishes many of the desirable things of life in a limited time.

The trouble in the standardization of some properties lies not only with the purchaser but with many manufacturers. The latter in designing equipment do not take into consideration the many conditions of interchange of the maintenance parts and will even go so far as to expect radical changes to be made to permit the use of their product. While this is true of some manufacturers, many purchasers also have ideals which are entirely vague. This leads them to make many changes which could not become standard either in their own rolling stock or on any other system. The undertaking of standardizing an electric railway which constitutes the amalgamation of a chain of small companies, each of which had discarded equipments purchased second-hand, is the problem which confronts many rolling stock superintendents at the present time in building all types to a common standard. While some systems have endeavored to be abreast of the times so far as their means would permit, the many miscellaneous items to be considered in standardization will tend to increase the reliability of the service to the public and decrease the maintenance costs of the company.

FROM TWELVE TYPES TO TWO

The undertaking to standardize the rolling stock of the Los Angeles Railway was begun under most of the foregoing conditions. We had twelve different types of passenger cars, ten different designs of trucks, seventeen different types of axles and six different types of motors.

The adopted standard car bodies of this company now consist of two types, known as the California combination pay-as-you-enter rear-end car and the

center-entrance car. While they differ essentially from each other in their general appearance, yet they are practically the same in construction, except the floor framing. All other construction and parts subject to maintenance such as vestibules, posts, sash, glass and draft attachments are identical and interchangeable.

It would be rather difficult to give any detailed description of the rebuilding of these car bodies, as the work of rehabilitation was simply the overhauling of what might be considered obsolete standards.

Three hundred of these cars were changed to pay-as-you-enter rear-end type in the period of two years; but then the fashion of women changeth with the setting sun, and in this age of the hobble skirt, it becomes necessary to "rubber" for new designs to meet the prevailing changes in the mind of the fair sex. To be equal to their call, the development of the center-entrance low step became a necessity.

ONE TRUCK FOR ALL CARS

In the standardization of trucks, owing to the many different types, it was next to impossible to rebuild them to a common standard. Therefore, it became necessary to eliminate the old and to adopt an entirely new truck which could become a standard common to all cars, both passenger and service equipment, and which could also be used for either double or quadruple motor equipment. No concrete specifications were prepared for the construction of these trucks, as they were built at the company's shops. Special machinery and jigs were built expressly for this purpose. In the construction of this truck, all parts are not only a special standard but are also interchangeable. Thus the top and bottom arch bars, end plates and braces will fit on either end side, or reversed, and the pedestals are the same. No rivets enter into the construction of

Standard End-Entrance, Pay-As-You-Enter Car, Los Angeles Railway

Side and Top Views, Standard Los Angeles Railway Trucks

this truck, all of the parts being very firmly held in position by bolts, which give a perfectly noiseless truck.

AXLES, BRAKESHOES AND MOTORS

The maintenance of seventeen different axles was a serious condition. After due consideration a $4\frac{1}{2}$ -in. cold-rolled steel axle with 30-in. chilled cast-iron wheels was adopted. While we have a single truck as a standard, we have both double and quadruple motor equipments to maintain. This necessitates two different classes of brake construction. With the double motor equipment the brake attachments are simplified to the adjustment of a single nut.

The standardization of brakeshoes also received due consideration. Where seven different kinds of shoes to supply different trucks had been required, six were eliminated and a single shoe was adopted. This is a reinforced-back cast-iron shoe.

With seven different types of motors to maintain, some of which could not be rebored to fit the adopted standard $4\frac{1}{2}$ -in. axle, it became necessary to scrap many of the old motors. As the adopted axle was larger than that for which many of the motors were originally built, it was necessary to devise boring machines for this purpose. One of these machines rebored 828 motors. This was so constructed that it rebored all four bearings in a single

operation. This type was shown on page 1332, *ELECTRIC RAILWAY JOURNAL*, Nov. 21, 1914. The other machine handled 384 No. 101 motors, reboring both axle bearings in a single operation. Some of these motors had different gear and pinion centers, requiring special gearings. These distances were changed to a single standard, which permitted the adoption of a single standard gear and pinion. The reboring of all motors for a standard axle also reduced a variety of motor bearings to a single unit.

Many of these motors were constructed originally for grease lubrication. As the later types of motors were constructed for oil the old motors with grease boxes were chipped out, and a special oil feed-cup was applied.

The work already done on standardization is an indication of our independence of the many varieties of car construction. Every standard has certain factors, as supply, use, price and assignment, and the exploitation of these has saved us time, material and equipment. Furthermore, the interest saved in store stock, where many repair parts were formerly carried, has been a large factor in bearing a portion of the expense entailed in this rehabilitation of rolling stock. The space required for stores is one-half of former days, although we are operating more cars, and the discarded space is now available for car stripping in summer and car washing in winter.

San Diego Exposition

The Sectionalizing of Electric Railway Feeders at San Diego

*Sectionalizing Switches Adequately Handle Conditions that Otherwise
Would Call for a 30 Per Cent Increase in Copper Over Present Use*

By HOMER MACNUTT

Superintendent of Motive Power San Diego Electric Railway

THE overhead system of the San Diego Electric Railway, consisting of feeders and trolley, differs considerably from most street railways inasmuch as under normal working conditions the sections are connected together all over the system with automatic sectionalizing switches. The feeders, in consequence, all operate in multiple as shown in the accompanying drawing of trolley sections. The switches are automatic in the sense that they are controlled from the switchboard. At the power station, the feeders to the different lines are mounted on separate panels through switches and breakers in the usual manner, but in case of accident or ground, any section may be cut out by opening the feeder breakers. It is not necessary in any case when it is desired to cut power off of any section to send a man out to pull switches, and as soon as the trouble has been cleared, the operator puts the section back on the line, thereby closing such sectionalizing switches as may be connected with it.

The first part of the San Diego installation was made in 1911 when eleven General Electric switches were installed. They worked out so satisfactorily that in making additions last year five more were installed. Nine of the switches are located within a radius of 1 mile of the power station, and during the five years of application not a single switch was lost. Further, the total amount for repairs during this period has been less than \$25.

As the feeders work in multiple, the peak de-

mand is divided among several feeders and the maximum current on any one is much less than if all the current for that one section was delivered over but one feeder. The result is a comparatively steady load on each feeder out of the power station with each feeder designed for that steady load which is less than maximum. To obtain the same voltage conditions without the use of these sectionalizing switches, an increase in copper of about 30 per cent would be required.

When a "short" occurs on the line, all, or nearly all, of the breakers go out. This is considered an advantage rather than a disadvantage because the total current is divided among many breakers, while without the sectionalizing switches one feeder breaker must open the circuit with the consequent

Graphs Showing the Flow of Current in Feeders
Before and After Sectionalizing the San Diego System

burning. During the period this system has been used not a single breaker has been burned or put out of service.

With this system, the current delivered from the power station to any point on any feeder is simply proportional to the resistance. Should the resistances of the two feeders from a switch to the power station be equal, the average current through the switch will be zero, but if the resistances are unequal, the exchange will be all in one direction through the switch, the feeder with the lower resistance delivering the most current. The following example shows the effect of adding copper to one of several feeders operating together:

An additional 500,000 circ. mil. feeder was recently installed on Section No. 7, from the power station to Sixteenth and M Streets and records of the exchange of current through the sectionalizing switches Nos. 1, 2 and 3 were taken, before and after installing, by means of a General Electric Type C-5, curve-drawing ammeter, the zero of which is on the center of the scale. An examination of Figs. 1 and 2 shows that the installation of the additional feeder has made the average exchange of current at switch No. 3 practically zero instead of being about 175 amp. from the loop feeder No. 6 to the Logan Heights feeder No. 8. In other words, this load of 175 amp. has been shifted from feeder No. 6 to feeder No. 8. Similarly, Figs. 3 and 4 show how much the exchange current at switch No. 2 has been reduced and the load demanded by feeder No. 7 carried by the new feeder instead of being obtained from feeder No. 8. Going to switch No. 1, Figs. 5 and 6 show that feeder No. 8 now is in condition to deliver current

to the San Diego & South Eastern Railway instead of demanding current from the San Diego & South Eastern Railway, as is seen by the charts.

The San Diego Electric Railway has extended this system to interurban and suburban lines which are customers and take 600 volts direct current direct from the power station. The benefit is mutual as it not only gives the customer additional capacity and better voltage, but gives the city lines the advantage of such copper as is in place on the customers' lines. An accompanying diagram shows the interchange of current between the San Diego Electric Railway Company and the San Diego & South Eastern Railway Company's feeders at switch No. 1. In general, the chart shows that this customer demands more current through this switch from the city lines than the city lines demand from the customer. At such points of connection it is necessary to install, beside the sectionalizing switch, two kilowatt-hour meters. One of these meters registers the energy transferred from the customer to the city lines and the other registers the energy transferred from the city lines to the customer. Each meter is arranged with a detent to prevent it from running backward when the current reverses. The difference between the amounts of power transferred in each direction is the net transfer in one direction. Should this net transfer be in favor of the customer, it is added to his monthly bill; but is subtracted if it is in favor of the city lines. Another drawing shows the connections of these kilowatt-hour meters and the sectionalizing switch with the feeders at Grand Avenue and Twenty-eighth Street. Such connections are made as far from the power station as possible.

The Rise and Decline of the Jitney in Its Birthplace

*The Enfant Terrible of Transportation, Its Birth and Vicissitudes—The
Unregulated Jitney Can Injure but not Supplant the Electric Railway*

By E. L. LEWIS

Superintendent Los Angeles Railway

IN earlier years the only competitor of the electric railway was the wagon or bus transportation, begun by striking trainmen, but these never outlived the period of the strike and often died earlier. It remained for the free-lance 5-cent automobile, or jitney, to offer a seemingly durable competitor, if not a successor, to the electric street railway.

Since Los Angeles has the doubtful honor of having given birth to the jitney its experience with this *enfant terrible* of transportation is longest and, therefore, possibly most illuminating. It was on July 1, 1914, that the first 5-cent automobile appeared on our streets. Our city, like the rest of the country, was in the slough of industrial depression, and thousands of men were ready to grasp at anything that promised a living. The news-

papers also brought many into the jitney ranks by exaggerating the income and ignoring the inevitable items of outgo of jitney operation. No wonder, then, that by Dec. 31, 1914, the number of jitneys had reached the enormous total of 761 in a city of 500,000 people. Of course, it did not take very long to demonstrate the absurdity of operating automobiles at a 5-cent fare, despite the absence of anything but a perfunctory regulation by the police.

By Jan. 11, 1915, following the license renewal date, the number of jitneys had fallen to 501, many routes had been shortened and some abandoned altogether. In fact, at the present time the jitneys do not even attempt to operate in certain sections of Los Angeles.

But while jitney operators were continually drop-

First and Main Streets, Los Angeles, Where the Jitney Park Is Formed for Attack on Electric Railways

Charge of the Jitneys on Electric Railway Revenues at 5.09 P. M. at Fifth and Main Streets, Los Angeles

ping out of the field, on learning that they made less than laborers' wages, the number of machines in service without regulation remained fairly constant, say 490, between Jan. 15 and June 30, 1915. The explanation is the very simple one of "There's a new sucker born every minute." Los Angeles probably has at all times a larger floating, work-seeking population than any other American city of its size, so that defections within the jitney ranks are rapidly made up within the constant average mentioned. For example, sixty-six cars dropped out between March 1 and March 18, but seventy-two cars entered; between March 18 and May 11 137 cars came in and 139 cars went out.

Since Jan. 1, 1915, to Aug. 16, 1915, 1132 automobiles have worked in the jitney service. Of

this number 302 were in the service on Aug. 16. On July 1, 1915, the regulatory ordinance became effective, requiring a bond for \$11,000, together with the same license fee of \$2.50 per month as heretofore paid, and with the additional requirement that the bus owner must elect the line he is to operate on and work on that line and always go to the end of the route before turning back. This regulation immediately reduced the number operating to 245. Since that time, however, they have been gradually adding to the number until something more than 400 have taken out licenses. The difference between this number and the number in operation on Aug. 16 is a brilliant illustration of the undependability of this service. There is no requirement or obligation anywhere that a man

Three Men on a Jitney Running Board Built for None

furnish service after he has taken out a license to do so or that he shall make any certain number of trips during a day.

Although 302 were operating at various times on Aug. 16, computing the total time operated by all machines and allowing ten hours for a day's work reduces the number to 265. On that date the trips made by the various machines were as follows: Eight machines made one trip; seventeen machines made two trips; fourteen machines made three trips; thirteen made four trips; twenty-four made five trips; twenty-two made six trips; twenty-four made seven trips; twenty-six made eight trips; thirty-seven made nine trips; thirty-seven made ten trips; twenty-seven made eleven trips; nineteen made twelve trips; fifteen made thirteen trips; five made fourteen trips; eight made fifteen trips; two made sixteen trips; three

made seventeen trips; one made eighteen trips; total, 302 machines.

All recent checks show the income per jitney has increased from \$1.50 to \$2 per day, varying on the different lines. This is brought about by the decrease in numbers and favorable weather.

Bear in mind that prior to July 1 only the law of "jitney eat jitney" was in effect. The jitney was free to go where it pleased, to alter the length of its run at will, to furnish no bond and to pay no taxes whatever, except a fee of \$2.50 per month. At the same time the paved streets of Los Angeles offered no physical hindrance leading to extraordinary tire wear or maintenance.

It follows, then, that with everything in its favor the 5-cent automobile can injure but not succeed the electric railway as the chief means of city transportation.

Where the Jitneys Come From. Significant Signs at the Open-Air Market on Main Street, Los Angeles

The Application of Established Legal Principles to the Jitney

*New Aspects of Old Questions Concerning Financial Responsibility,
Regulation and Taxation of Common Carriers Are Presented
—If Treated Like a Street Railway the Jitney Cannot Survive*

By W. E. DUNN

Vice-President Los Angeles Railway Corporation

EVERY development in the industrial or economic world brings its train of legal problems. In our law libraries and offices are found books, weighty volumes, bearing such titles as "Railroads," "Street Railroads" and "Automobiles," witnessing the law's interest in these successive developments of transportation. If the airship has not already found its place in the same company, it must be because the problems it has so far developed do not come within the range of ordinary law practice.

And now the jitney, mushroom growth though it appears to be, has entered the field of legal vision. Already it has claimed much legislative attention, and it must soon find its way into the courts. We may confidently predict, however, that it will prove with the jitney, as with more substantial and permanent developments of transportation, that the legal questions it presents will be for the most part only new aspects of old problems, and readily solved by the application of settled principles of the law.

FINANCIAL RESPONSIBILITY

Perhaps the most novel, or apparently novel, question which the jitney traffic has raised is that of insuring financial responsibility on the part of the owner or operator. The imperative necessity for legal compulsion in this matter arises from the invariably impecunious condition of those who engage in the traffic. Our law has been familiar with bonds required from public officers to secure the faithful performance of duty, and from contractors on public work to secure the execution of their contracts, as well as for the payment of laborers and material men. But the astute legal mind may observe a difference between the requirement of a bond in these and other instances, in which there is a direct governmental interest, and the requirement of a bond to protect passengers or other persons suffering injury through the negligence of a jitney operator. The closest precedent we have mentioned, the public contractor's bond for the payment of laborers and material men, has been sustained by the courts as tending to secure satisfactory performance of public work, rather than protection to the creditors of the contractor.

Adequate grounds can, nevertheless, be found, sanctioned by judicial precedent, to sustain the requirement of indemnity insurance from the operators of motor buses. The courts are bound to recognize the necessity for such protection to the public. The dubious character of the vehicles usually selected for the jitney traffic, the want of previous experience in the handling of motor cars by most of the operators, and the constant inducement for haste and the consequent taking of risks, render accidents inevitable; and the police records of every city demonstrate how frequently these result in death or serious personal injury. It may well be, therefore, that the courts will hold the requirement of indemnity against such injuries within the scope of that comprehensive "police power" which gives practical force to the maxims *Salus populi est suprema lex* ("The welfare of the people is the supreme law") and *Sic utere tuo ut alienum non laedas* ("So use your own as not to injure another").

This police power has always been regarded as sustaining legislation excluding the incompetent from employments affecting the public health or safety. A familiar instance is the examination and licensing of physicians and dentists. Like requirements have more recently been sustained as to undertakers, plumbers, architects, etc. The examination of locomotive operators under state authority, and of navigators of vessels under federal authority, is another precedent very closely in point. It is thus clear that the incompetent may be excluded by legislative enactment from such an employment as the operation of motor buses on the public streets. It would seem equally clear that competency for such an employment would include the ability to respond financially to liability for injuries occasioned by the negligence of the operator.

REGULATION

There is another legal aspect of the jitney traffic which will sustain the requirements we have been discussing, as well as the other regulations of its operation which the public interest may demand. It must be conceded, we think, that the jitney bus is a common carrier, a public utility. The business it undertakes is clearly a service "affected with a

public interest" within the conception established as the constitutional basis of regulation by the decision of the United States Supreme Court in *Munn vs. Illinois* (94 U. S. 113). The doctrine of that case is epitomized in this sentence from the opinion rendered by Chief Justice Waite:

When, therefore, one devotes his property to a use in which the public has an interest, he, in effect, grants to the public an interest in that use, and must submit to be controlled by the public for the common good, to the extent of the interest he has thus created.

Subsequent decisions have more fully defined the nature of the power thus affirmed, setting necessary limits of reasonableness in its exercise, but at the same time giving it a most comprehensive scope. Thus, it is settled law that this power includes not only regulation of rates, but also of service, the extent and character of facilities afforded and kindred matters.

That the jitney traffic calls for most positive and effective regulation in the interests of the public even its friends must admit. The temptation to overcrowd its vehicles (of doubtful capacity to start with) to increase the margin of possible profit is irresistible to the average operator. Restriction of the number of passengers carried in respect to the normal capacity of the vehicle is, therefore, a necessity. So also is regulation of the manner of loading, as by prohibiting the carrying of passengers on the running board or in a manner to obstruct the driver's vision. The importance of examination to determine physical competency and moral fitness of the operator is likewise obvious.

Regulation in these and many other particulars by municipal or state legislation is demanded for the protection of the public. All of these matters, as well as the insurance of financial responsibility first discussed, appear to be within the scope of valid regulation of a public service.

TAXATION

Another group of legal problems affecting the jitney traffic arises out of the fact that it makes a special use of the public streets for private gain. This has always been invoked as justification for imposing special and onerous burdens upon railways occupying public streets. The requirement of paving and keeping in repair a designated portion of the street is a familiar instance. In California, for example, this requirement covers not only the space between the rails and tracks, but a width of 2 ft. on each side of the outer rails. Since paving is required for and benefits not only the railway but the general public, exacting its cost from the railway is simply a tax; or, giving it the most favorable construction possible, a compensation demanded for the privilege of making a special use of the street.

Whatever justification this exaction may have as applied to street railways it must also have as applied to other modes of commercial transportation using the streets. Whoever, therefore, argues for the continuance of the jitney as a legitimate competitor of the street railway must admit that it ought to be subject to a corresponding tax for the privilege of using the streets. No one can deny that the jitney buses do an aggregate amount of damage to street pavements far exceeding that occasioned by railway transportation of an equal number of passengers. Indeed, the railway is of no substantial injury to the street or its pavement, while the motor car, with its rubber tires, is recognized as one of the chief destroyers of pavements and other street surfaces. Thus, a parliamentary investigation in Great Britain developed the fact that the cost of maintaining London pavements was more than doubled by the advent of motor buses.

The expense of paving is only one of many forms of exaction imposed upon street railways for the benefit of public revenues. Franchise taxes, car license taxes, percentage tax on gross receipts are burdens commonly laid upon the revenues of the railway companies. Equivalent burdens must be laid upon the jitney traffic or else there is no fairness in its competition with the railway. Protection to the public revenues must also demand such levies upon the jitney traffic, since the latter, if allowed to operate without adequate restriction, will substantially reduce the receipts of the street railway traffic. This directly reduces the amount of every form of taxation based upon gross receipts, and ultimately, if indirectly, other forms of tax as well.

It is evidently not feasible to apply all these special forms of taxation to the jitney traffic, but some equivalent may be devised. A license tax proportioned to the seating capacity of vehicles may afford the readiest solution of the problem. The courts have allowed to legislative bodies the widest discretion as to the amount of license taxes. They have also conceded the right to distinguish in manner and amount of tax between different occupations and lines of business, providing there is any substantial difference between them. The jitney readily differentiates from other modes of transportation, even such as also employ the automobile. It differs in such matters as the rate of fare and the mode of determining its amount, the manner of securing patronage, the receiving on the same trip of passengers from different points bound to different destinations, the control of time and route of journey by the operator, and the frequency of repeated trips over the same route. The last-mentioned point is specially important as justifying a higher license tax, since it marks the greater dam-

age done to street surfaces by motor bus operations.

What will be the future of the jitney if subjected to these necessary regulations and justifiable tax burdens? The experience of the cities which have tried the experiment, as well as the objections raised in other cities where such restrictions are proposed, predict the speedy disappearance of the jitney as a substantial competitor of the trolley car. All competent investigators have agreed that there is little if any margin of profit for the jitney, even when operating without regulation or special taxation. The cost of meeting even the minimum of requirements imperatively demanded by the public interest must prove prohibitive of continued operation of motor buses with a nickel fare.

There should be none to mourn this result. Even the would-be jitney operator is saved from a loss rather than deprived of a profit. And the community at large escapes the disaster which the jitney threatens by the reduction of street railway revenues to the point where adequate service to the public would be an impossibility and extension of lines would mean bankruptcy.

PUBLIC UTILITIES SHOULD BE PROTECTED

This vital interest of the community in the triumph of the street railway over the jitney bus suggests another interesting problem, but one which need never be solved if appropriate regula-

tion realizes the result herein predicted. But if elimination of disastrous jitney competition with the street railway were not effected by the indirect method of regulation, would not its elimination by more direct action be sound public policy and a valid legislative act? The necessity is now recognized by public utility commissions and legislatures of protecting established utilities rendering adequate service to the public by preventing the entry into the same field of rival utilities whose competition could not substantially benefit the public and would be disastrous to the existing utilities. The duty of the public to afford such protection to an existing utility may be justly claimed as an essential complement of its asserted right to measure out the burdens to be borne by such utility. The principle of public policy and regulation thus recognized would seem clearly to justify legislative exclusion of the jitney bus where its competition might be disastrous to an existing railway system, even if the jitney promised when fully established to provide a satisfactory substitute in service to the public. But it is apparent that the jitney, as a substitute for the street railway, is impossible, and as an addition it is little better than a parasite sapping the strength and vitality of the railway service, and giving the public nothing commensurate in return. Wherefore, if the jitney does not voluntarily withdraw from the field, public interest must ultimately force its removal.

One Club in Los Angeles Railway Baseball League

Recreation and Welfare Work for Los Angeles Railway Employees

*The Employees' Association at Los Angeles Is Unusual in that
It Is Organized for Social Relations and Recreation Exclusively*

By L. O. LIEBER

Electrical Engineer Los Angeles Railway and President Employees' Recreation Association

THE climatic conditions in Los Angeles offer such favorable advantages to all kinds of outdoor sports and amusements that nearly all large organizations which employ great numbers of men have extended financial support toward creating or maintaining active interest in the diversity of pleasures possible to their employees.

Through its active heads of departments the Los Angeles Railway has had a very decided interest in the 4199 men on its staff. For some years the platform men have had recreation rooms located at their respective carhouses where they are at liberty, while off duty, to assemble and enjoy billiards, pool, cards, checkers, etc. Gymnasiums and

an up-to-date reading room well stocked with books and magazines are also provided.

Inter-departmental baseball has been encouraged. The divisions have been provided with playing suits and grounds for the development of this game.

We also have an active organization of our employees, known as the Los Angeles Railway Employees' Recreation Association. Its object is what the name implies—for the recreation of employees. This association was inaugurated at a picnic at the instance of the writer. The movement was heartily approved by the management and unsolicited support was rendered toward making each annual picnic or banquet one of social betterment.

Sporting Features at Picnic of Los Angeles Railway Employees' Recreation Association

Comedy Feature at Picnic of Los Angeles Railway Employees' Recreation Association

Through the association's direction an organized band of more than fifty pieces has been maintained by the company from a beginning of four or five pieces. The weekly practice nights are well attended as a rule and, as in the case of the baseball club, all uniforms for the band were donated by H. E. Huntington, president of the corporation. Occasional get-together smokers are held at the respective carhouses with the assistance of the band in uniform, where good music, speaking and smokes are enjoyed with a spirit of good fellowship by officials, employees, families and friends.

The company has begun to convert an unused building centrally located into a suitable clubhouse for the association, where it is expected that a still closer bond of co-operation, unity and sociability will be developed.

The association's officers and general committee are selected to embrace the several departments of the railway. At this time the writer is president, Superintendent E. L. Lewis, Assistant Superintendent F. Van Vranken and Master Mechanic E. L. Stephens are vice-presidents; Chief Operator J. E. Bass is treasurer and Clerk T. A. Donahue is secretary.

The general committee consists of foremen and sub-foremen of the different departments and several others who are chosen at large. Membership is open to all employees of the Los Angeles Railway. No dues are charged, nearly all expenses being borne by the company. For example, the annual picnics alone cost the company from \$2,600 to

\$2,900 each, and the total outlay for the last three years averages \$4,000 per annum. The only revenue which comes from the members is through their purchase of tickets for special events.

The first annual picnic was held at Redondo Beach, Sept. 17, 1910. The morning events were of athletic nature, such as races for men, women and children, tug-of-war and inter-departmental baseball. In the afternoon, dancing and water sports were the chief features. The winners of the sixteen events of the day received prizes, some donated by individuals in the company and others by local merchants.

The following picnics have been of like character except that one or more novelties were arranged for each occasion. Thus a "Cinderella" or "fit-the-slipper" contest and a "duck hunt" were features of the 1911 picnic; home-made vaudeville in costume, as illustrated, in 1912; egg and spoon and obstacle races in 1913. In 1913, also, the band came to the fore with a pleasing program of popular and classical music.

Increasing experience in giving the annual picnics showed that the visitors would enjoy themselves still better if they were not obliged to witness too many contests. Therefore, at the 1914 picnic a few events were omitted to give people time to amuse themselves in their own way.

It may be of interest to add that about two years after the formation of our association, a similar body was formed by the Pacific Electric Railway, which operates all interurban railways radiating out of Los Angeles.

Band of the Los Angeles Railway Employees

Electric Car Terminal of the San Diego Electric Railway

Handling Traffic to the Panama-California Exposition at San Diego

To Provide Adequate Transportation Facilities a New Line Was Built to Balboa Park, Which Previously Had No Railway Connections

By B. M. WARNER

General Superintendent San Diego Electric Railway

THE arrangements made by the San Diego Electric Railway to transport people to and from the Panama-California Exposition have proved ample for safe, expeditious and comfortable service. The grounds are located in Balboa Park, which previously had no railway facilities owing to its undeveloped condition.

We therefore constructed during 1914 a line running on Twelfth Street from F Street to the main eastern entrance of the exposition. This double-track line was 1.5 miles long, and at the same time it served to complete a loop service embracing lines already running on B Street, Third Street and F Street, as shown in the accompanying map. The new work was installed at a cost of \$45,000, exclusive of the \$20,000 terminal described in the *ELECTRIC RAILWAY JOURNAL* for March 20, 1915.

As stated in the description of the terminal, passengers alighting from either of the two lines which serve the main entrance walk downstairs, from either of the two unloading platforms, under the departure tracks and return to the original level after passing through exit turnstiles. The latter are used, of course, to prevent improper ingress.

Passengers entering the cars by way of the single loading platform of 2000-passenger capacity first pay their fare by dropping the exact amount into any one of ten turnstile boxes made by the Coin Machine Manufacturing Company, Portland, Ore. A change-making booth is available for those passengers who lack the exact fare. Under this scheme, the passengers enter their cars in the shortest possible time, the conductor being relieved

of all work incidental to the collection of fares except the later issuance of transfers.

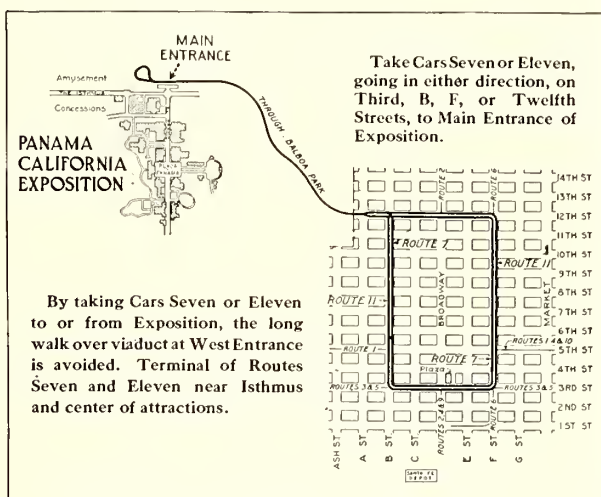

NEW ROLLING STOCK

To handle the extra business anticipated we purchased during 1914 from the St. Louis Car Company forty double-truck center-entrance cars 50 ft. long over all. These cars differed from the preceding type in being 6 ft. longer and having ramped floors instead of a 5-in. riser at the edges of the well. In order to avoid accident from having two types of car wells, the original twenty-four center-entrance cars were rebuilt for ramp operation. The seating capacity of the larger center-entrance cars is fifty-two passengers and of the smaller forty-four.

During heavy service we operate the cars in two-car trains, always using exactly the same type for leader and follower. We find that two-car trains can be operated over the loading tracks at an average of one a minute without the least confusion. It should be stated that the loading platforms are long enough to care for three trains at a time, discharging or loading. The train connections are readily made with the aid of a Westinghouse automatic type C coupler, which takes care of air and coupling. For night service, however, a jumper for the lighting circuits is put in by hand. General Electric type M K control is used with GE-201 motors.

TRAVEL DATA FOR PUBLIC

An interesting point in connection with the routing of travel to the exposition was the education of the riding public. With the original Fifth Street or No. 1 line it was possible for the public to reach the western entrance of the grounds by walking over a bridge. Local riders, familiar with the territory, were especially prone to do this. We therefore issued a pocket folder the inside of which is exactly the same as the illustration already mentioned. This shows that Routes 7 and 11 are preferable for riding to the exposition as they go

San Diego Electric Railway Map, Showing Direct Route to Exposition

directly to the main entrance. The same lines also serve the great concrete stadium which the city of San Diego opened on May 31, 1915. This stadium cost \$150,000 and seats 30,000—one-third of San Diego's present population. Soon after the issue of this pamphlet in January we found that the No. 1 line, which required a three-minute service for regular business alone, was no longer loaded with exposition travel.

POCKET CARDS FOR TRAVELERS

For the general information of the public we have also issued two pocket cards. One of these cards describes the routes which correspond to our system of route numbers, the other names places of interest and how to reach them. The back of the second card also carries the schedule of the Coronado (Tent City) division showing the cars that make the local steam railroad connections. Visitors are also aided by our uniformed street solicitor at Third Street and Broadway, who not only directs people but is prepared to sell them tickets to various points of interest. In addition inspectors are stationed at different points in the congested district.

Boarding Cars After Passing Through Turnstiles

Two-Car Train at the San Diego Terminal

Economics of the Jitney Problem from a Traction Company's Viewpoint

With Taxes Imposed in the Form of Licenses and Under Reasonable Regulations the Jitney Is Proving an Economic Impossibility

By C. N. BLACK

Vice-President and General Manager United Railroads of San Francisco

FROM the street railway company's standpoint the most important question in connection with the jitney bus problem is unquestionably the economic one.

If it is financially possible under reasonable regulations to operate a five-passenger Ford automobile on the streets of any city, and carry passengers for a 5-cent fare, the jitney bus has come to stay, and if such is the case the sooner the street railway companies realize the fact and adjust their operating conditions to meet this competition the better. Of course, this would mean the adoption of the European zone system or something of that character. On the other hand, if it is not financially possible to operate an automobile, even under the most favorable conditions, and carry passengers for a reasonable distance, from 2 to 3 miles, for a 5-cent fare, it is safe to assume that the jitney is a passing fad, which will die out within a comparatively short time.

Generally speaking, it has been found that, in those communities which have imposed taxes in the form of licenses, even approximately comparable with those paid by the street railway companies, and other reasonable traffic regulations, the jitney buses have practically ceased operation. It would seem, therefore, that even the apparent margin of profit is extremely small. The words "apparent margin of profit," are used advisedly, because of the fact that the majority of those who are operating jitney buses have no accurate knowledge of the actual cost of the service. This cost will naturally vary to a greater or less extent in different cities, depending upon the character of paving, the topography, the length of haul and the obstructions in the streets caused by other traffic.

In San Francisco the great majority of the jitney buses operate on Market Street, and all of the conditions affecting the cost of operation, with possibly the exception of obstructions in the streets caused by other traffic, are as favorable as can be found anywhere.

For a five-passenger Ford car making an average of 125 miles a day, and operating 300 days a year, the actual cost is very close to \$2,500. This cost is made up as shown in the accompanying table.

The depreciation charge is based upon the assumption that the car will have a useful life of one year

and at the end of that period it will have a scrap value of \$65.

The cost for liability and fire insurance is the present cost of an insurance policy as required by the San Francisco ordinance. Taxes and licenses are based upon the present State and municipal requirements.

It will be noted that the taxes and licenses amount to what is equivalent to \$6.75 per passenger seat, while at the present time the street railway companies of California pay to the State alone for taxes an equivalent of approximately \$20 per seat, and in municipal taxes, car licenses and paving maintenance there is an additional tax equal to approximately \$30 per seat, or a total of \$50 per seat, as compared to the \$6.75 paid by the jitney buses.

From the above it will be noted that the actual daily operating cost of a jitney bus in San Francisco is at least \$8.28, and unless the gross earnings equal or exceed this amount, or unless the driver is willing to render his services for less than \$2.50 a day, it goes without saying that the business is conducted at a loss.

From numerous counts of the passengers actually carried by the jitney buses operating in direct competition with the street railways in San Francisco, it has been found that the average receipts are less than \$7.50 a day. If these statistics are correct it will naturally be asked how is it possible for them to exist. In other words, where does the revenue come from which the jitney bus driver is enabled to meet the deficit between the actual operating costs and the gross revenue derived from the business of a common carrier?

It is unquestionably a fact that a certain percentage, perhaps a small one, of the men operating jit-

EXPENSES OF FIVE-PASSENGER FORD MAKING 125 MILES PER DAY	
Daily operating expenses:	
Gasoline, 7.4 gal., at 10 cents per gallon.....	\$0.74

Driver's wages.....	2.50
Total	\$5.92
Annual expenses and fixed charges:	
Daily operating expenses, \$5.92 for 300 days.....	\$1,776.00
Depreciation	450.00
Garage and washing	120.00
Liability and fire insurance.....	96.00
Interest	15.00
Taxes and licenses	27.00
Total	\$2,484.00
This is equivalent to \$8.28 a day.	

ney buses have been enabled to make a profit over and above a reasonable driver's wage of, say, \$2.50 to \$3 a day. The amount of \$7 to \$7.50 per day is probably more than the average jitney bus can earn even by operating twelve hours a day in direct competition with the street cars, but there is another source of revenue available to him, viz., the field occupied by the taxicab. When business is slack along the lines of the street railway the jitney turns to the taxicab business and by furnishing the service at one-half, or less, of the rates charged by the taxicab from \$2 to \$3 additional revenue is picked up. Of course, this is possible only by reason of the fact that the operators of these cars are permitted to choose their own route, and that they are sole judges as to the service which they shall render. Should they be required to operate over a fixed route, under a given headway and for a specified number of hours a day, the combination service now rendered would be practically impossible. All street railways are limited to a prescribed route, and, generally speaking, they are not permitted to change their routes without municipal permission.

Notwithstanding the inequities to existing industries, however, if the jitney is really an advance and furnishes additional transportation facilities, it will become a permanent industry and transportation companies will have to meet the new conditions.

What are the advantages offered by the jitney service?

First—As claimed by the operator of the jitney bus, a ride in a comfortable conveyance, on upholstered seats, in the open air.

Second—A material saving in time required to reach the rider's destination.

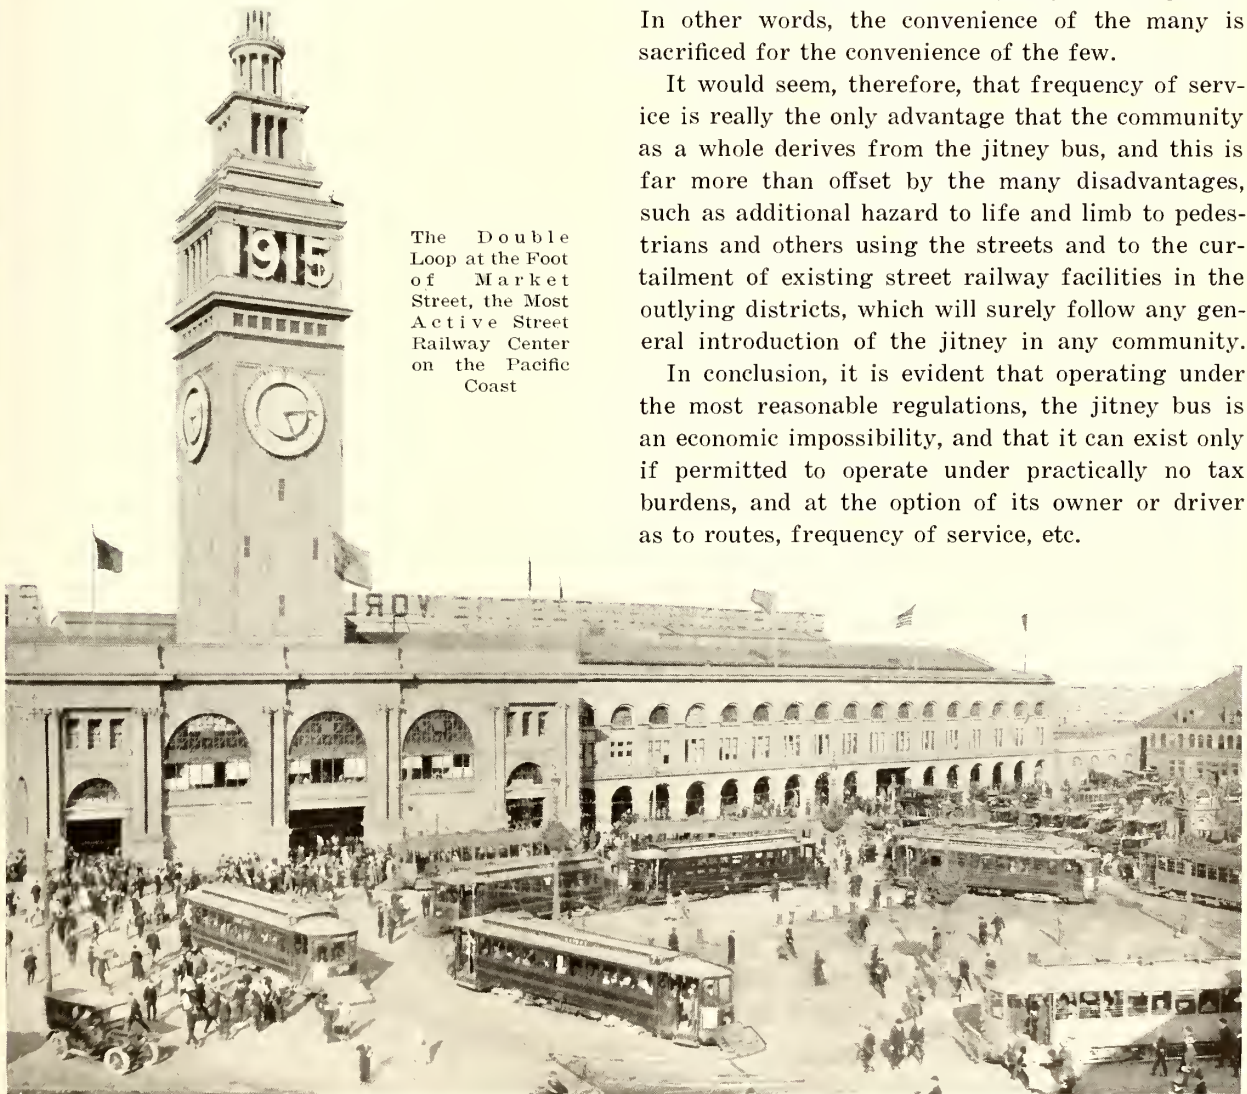

Third—Frequency of service.

The first may be considered as more or less of a passing fad and is largely dependent, as far as comfort is concerned, on weather conditions.

The second is partially true as far as the person patronizing the jitney bus is concerned, but, and this from the community's standpoint, is a most serious objection. While the rider in the jitney is enabled to reach his destination in a few minutes less time, the riders in the street cars, who number at least ten to one jitney rider, are delayed very materially by reason of the congestion of traffic on those streets over which the jitney buses operate. In other words, the convenience of the many is sacrificed for the convenience of the few.

It would seem, therefore, that frequency of service is really the only advantage that the community as a whole derives from the jitney bus, and this is far more than offset by the many disadvantages, such as additional hazard to life and limb to pedestrians and others using the streets and to the curtailment of existing street railway facilities in the outlying districts, which will surely follow any general introduction of the jitney in any community.

In conclusion, it is evident that operating under the most reasonable regulations, the jitney bus is an economic impossibility, and that it can exist only if permitted to operate under practically no tax burdens, and at the option of its owner or driver as to routes, frequency of service, etc.

The Double Loop at the Foot of Market Street, the Most Active Street Railway Center on the Pacific Coast

United Railroads Front-End Fare Collector at Work

Front-End Fare Collection Improves Service at San Francisco

Three Years' Operation with Front-End Collection Has Demonstrated Its Value in Relieving Congestion and Improving Car Loading

By HENRY T. JONES

General Superintendent United Railroads of San Francisco

LIKE most other city railways of the United States we are blessed with a number of traffic knots or congestion points. The principal one in San Francisco is at the Market Street ferry, where nine lines of the United Railroads and four of the Municipal Railroads come in over a double-track loop. In addition, this locality is the gathering point of hundreds of jitneys, sightseeing vehicles and the various hotel buses and taxicabs to meet the incoming travel from the East. In short, the Market Street ferry has the peculiar although undesirable distinction of being the greatest local and foreign traffic channel in the world. At this place we handle cars on less than a thirty-second headway, and for short periods even on a fifteen-second headway.

Other places where traffic congestion occurs are at our safety stations or isles along 1 mile or so of Market Street, at the exposition grounds, at the top of Fillmore Street hill, at the Third Street depot of the Southern Pacific Railroad, etc.

Of course, the prime essential in avoiding or minimizing congestion is to use every possible means to obtain quick loading. Our cars are all of prepayment type, both the front and rear platforms being from 5 ft. 4 in. to 6 ft. 3 in. over all with a railed entrance aisle of 36 in. on the platform. The steps are of moderate height, and, since the cars are of California open-end type, there are no bulkhead doors at the ends. In spite of this easy access construction the use of prepayment collection by way of the single aisle at the rear platform alone was too slow to meet our conditions. Thus the average time for loading a car with sixty-five people was as high as sixty seconds, thereby seriously handicapping the uniform movement of cars over the loops.

As we did not want to lose the benefits of prepayment fare collection we decided in 1912 that the best way to secure the quickest handling of passengers and still retain the prepayment feature would be to employ front-end fare collectors as aids

Regular Conductor's Transfer

to the regular conductor. These men, of course, are stationed on the street so that the same man collects fares for the successive cars that come through during the rush hour. In this way the entire width of the front platform is made available for entrance in addition to the entrance aisle at the rear. The time of loading a car with sixty-five passengers is thereby cut down to the point where a fifteen-second headway with prepayment is practicable. Furthermore, as passengers enter from both ends the cars are evenly loaded.

The men employed for front-end collection are our most experienced conductors, chosen especially for their quickness in fare collection and for their ability to direct passengers to the proper routes. For Market Street alone we may require as many as seven men, while at safety stations long enough to accommodate two cars we use two men. In all we employ from ten to twenty collectors, all in evening service between 4.45 and 6.15 o'clock.

Each man carries an International portable register. He rings up each fare as collected, the same showing as a large figure on the front, while the totalizer indication is on the back. No record is made of the fares collected for individual cars. In the meantime the fares received by the conductor on the rear platform are dropped in International or Johnson counting fare boxes, except on those

Extra Conductor's Transfer

The New Type of Market Street Safety Station, San Francisco

lines where fares are collected by hand and then registered on International machines by means of a foot plunger.

DIFFICULTIES IN ACCOUNTING

Of course, from the accounting standpoint the non-segregated registration of the front-end collectors is a disadvantage in not knowing the exact intake per car or even per line. So far as crediting each line is concerned, this is readily cared for by the accounting department, which assigns to each route its due pro-rata. The pro-rata, of course, can easily be determined by using the morning rush-hour receipts as a guide, since the passenger who goes out in the morning must come back in the evening. The only weakness is in the difficulty of checking conductors unless the inspector rides on the car for a considerable distance to watch pick-up traffic. It should be borne in mind, however, that the great bulk of the fares is taken at the street collection points where accurate inspection is easy. The system would be ideal from the checking standpoint if the register of the front-end collectors

contained a means of separately totalizing the collection of the successive cars.

SPECIAL TRANSFERS

In order to relieve the regular conductor from distributing transfers to passengers who enter via the front way, the collectors are supplied with transfers of the type illustrated. These differ from the regular transfers in that they do not bear the name of any issuing line, but do show the names of the connecting lines on which they are valid within the time punched. One feature of the transfer issued on the car is that it shows the transfer intersections in order, thus serving as an effective aid to the stranger who is watching for his transfer point.

On the whole, nearly three years' experience has convinced me that no more effective means than front-end collection could be devised for reducing congestion at so small an expense. Any company is warranted in giving it a thorough trial before going to the cost of building terminals in downtown districts.

United Railroads Low-Floor Car with Longitudinal Seats in the Center Closed Section and Cross-Seats in the End Sections

The Development of a Light, Low-Floor Car for San Francisco

By JESSE M. YOUNT

Master Mechanic United Railroads of San Francisco

The Latest Car Developed by the United Railroads Is the Low-Floor Type

THE earliest type of electric car for San Francisco was the double-step, open-end California design, that is to say, a car with a central closed section fitted with longitudinal seats and open-end sections also fitted with longitudinal seats, the steps running the full length of the open section.

The first advance, made in 1904, was to eliminate the full length steps of the open sections, regular length platform steps being placed near the ends of the closed section. Following this, in 1906, the California design as such was superseded by a closed, open-platform car similar to those long used in the southeastern part of the United States. This design proved unpopular because a large number of Californians prefer to ride in the open all the year around. In 1913, therefore, we returned to the California type except that a drop platform was substituted for one flush with the main flooring.

The 1913 car was much wider and longer than the early California type. It has proved so popular with the riding public that it has been adopted as standard by both our company and the San Francisco Municipal Railway, contrary to earlier recommendations made to the latter by its consulting engineer, Bion J. Arnold. Nevertheless, this car with standard equipment was heavier than what our management considered desirable for San Francisco conditions. We therefore set about to see what mechanical and electrical improvements were possible to retain all desirable features while making the car lighter, easier of access, safer and cheaper to operate.

Naturally, much of the excess weight was in the

motor and truck equipment. This led us to adopt for future cars the 24-in. wheel truck with the baby-type, high-speed motor and 10-cu. ft. compressors. By these changes alone we cut down the weight of the under-body equipment approximately 10,900 lb.

While the greatest reduction in weight came through changes in equipment under the car body, we also made a closer study of car-body framing and fittings. Among the changes that followed were the elimination of composition headlining, leaving the roof boards exposed; the size of carlines was very much reduced and the center line of the arch roof was lowered 3 in.; the length and width of the car were not altered from the dimensions of the 1913 type, but the platform construction was changed to avoid a riser from the platform into the car body. We are now using a ramp which is inclined upward $4\frac{3}{8}$ in. within the 8-ft. length from the platform edge to the bolster line. This was accomplished by offsetting the end sills as described on page 1016 of the *ELECTRIC RAILWAY JOURNAL* for May 29, 1915.

The results of the most recent improvements may be summarized as follows: We now have a car 47 ft. long, 9 ft. 2 in. wide, furnished with four GE-247 35-hp. motors, seating fifty people and weighing 34,180 lb., or 683 lb. per passenger. This compares with a car of the same dimensions weighing 49,000 lb., or 980 lb. per passenger. Probably no other city in the United States needed a light car so much as San Francisco, for on account of our many grades the average energy consumption per car-mile greatly exceeds that of other cities.

An Unexpected Vacuum Application

Use of the Vacuum System for Cleaning Cars in San Francisco

Vacuum Apparatus Has Replaced Hand Sweeping and Dusting at Two Car-houses with Noticeable Improvement in Cleanliness and Reduction in Cost

By F. W. ALLEN

Division Superintendent United Railroads of San Francisco

ON Aug. 14, 1912, we made our first installation of a vacuum outfit for car cleaning, the equipment being placed in our Geneva Avenue carhouse. The very first work indicated the superiority of the vacuum process over hand-work, both in speed and quality, and the results since obtained with experienced men have proved still better. The initial tests of Aug. 14, 1912, for sweeping and dusting showed up as follows for vacuum and hand operation respectively:

Type P & W Cars—Five cars averaged fifteen and one-half minutes per car with vacuum, and a second five cars averaged twenty-five and one-half minutes per car by hand.

Type 1200 Cars—Twelve cars averaged eleven

and one-quarter minutes per car with vacuum and eleven cars averaged twenty-six and two-eleventh minutes per car by hand.

Type 1700 Cars—Six cars averaged eight and one-third minutes per car with vacuum, and five cars averaged twenty-four minutes per car by hand.

Type 1300 Cars—Six cars averaged six and two-third minutes per car with vacuum, and seven cars averaged twelve minutes per car by hand.

Continued experience with our vacuum cleaning outfit has proved to our satisfaction that it is the most efficient method of cleaning. Brooms and dusters merely agitate the filth and cause it to lodge in another part of the car after the agitation ceases; whereas the vacuum cleaner takes out

Method of Getting Hose Into Car

Vacuum Hose and Fittings for All Cars

Rubber Nozzle Attached to Hose for Removing Dust from Controller Fingers and Segments

6.5 Hp. Machine Complete with Motor, Vacuum Producer and Separating Tank

of the car all dust, dirt and insects. Furthermore, while the cleaning is going on, the car is getting more than 100 cu. ft. of free air per minute. When the job is done the car floor looks as if it had just been scrubbed with a mop. The car cleaners like the machine, too, as they lose no working time from breathing dust and becoming ill in consequence.

Our first equipment was placed in daily operation on Aug. 15, 1912, and it required no attention at all until Sept. 27, 1913. The apparatus comprises but one 6.5-hp. motor-driven 3500-r.p.m. machine of Tuec type, made by the United Electric Company of Canton, Ohio, and San Francisco, Cal. This machine supplies four 1 $\frac{3}{4}$ -in. lines of hose at one time, an intake of 80 cu. ft. of air per minute being required at the nozzle of each line. We handle with this machine ninety-six cars in a nine-hour day, but if required the machine could handle 250 cars in twenty-four hours.

The installation cost of the plant was about \$1,500, while the maintenance cost has averaged but \$20 a month, inclusive of hose and tool replacements and repair. Its economy is shown by the

fact that the old method of hand cleaning required the services of nine men whereas the vacuum cleaner has enabled us to dispense with three men for nine months of the year. An extra man is put on only during the rainy season when there is much mud. The annual saving in labor is \$1,980, and allowing \$20 a month maintenance expense, the annual saving, exclusive of fixed charges on first cost, is \$1,740.

I might add that we have altered the original fittings in only one respect, namely, in replacing bristle brushes with felt, as the latter material is much more effective for going over both plain floors and maple strips. The felt also costs us but 35 cents to 40 cents compared with \$3 to \$4 for the original brushes. We also modified the aluminum nozzle connection to the brush by using a less abrupt angle. The consequent absence of an offset prevents matches, toothpicks and similar objects from fouling the nozzle.

Owing to the satisfactory results obtained with the Geneva Avenue equipment, a duplicate outfit was placed in our Twenty-eighth Street carhouse.

Old Hand Broom Method of Cleaning

New Vacuum Method of Cleaning

Improvements in Transit Lines to Handle Exposition Traffic

Transportation to the Exposition Is Ample—Front-End Fare Collection Has Proved Especially Helpful in Accelerating Car Movement

By T. A. CASHIN

Superintendent Municipal Railways of San Francisco

San Francisco Ferry Building from the Bay

WHEN the question of electric railway transportation to the Panama-Pacific International Exposition came up during 1913, the only means of reaching the grounds was by the Fillmore Street and Peak Street lines of the United Railroads of San Francisco. These two routes, however, could not furnish the most direct service from the principal centers of population. One reason for this condition was that the exposition grounds were located along a previously unused waterfront. In fact, a large part of the exposition is on made ground.

As the United Railroads and the California Street Cable Railroad considered the city's franchise provisions for extensions prohibitive, the municipality undertook to build the necessary routes as permanent extensions to the system which had begun with the Geary Street line. This meant an increase in single track from 15.08 miles to 41 miles. This total, however, includes the old Presidio & Ferries line which comprised 7.14 miles. The total amount of new track was therefore 33.86

miles. This work, including additions to the Geary Street carhouse, a new carhouse at Seventeenth and Hampshire Streets, track connections and 125 new cars, cost about \$3,000,000 in all. An important feature toward avoiding heavy grades was the accelerated building and completion of the Stockton Street tunnel, a project which had been in hand for several years.

Before the exposition, we had only forty-three cars, just enough for the Geary Street line. Toward the end of 1913 contracts were let with the Jewett Car Company, Newark, Ohio, for 125 cars of California type and substantially similar to the latest design of the United Railroads of San Francisco. These cars seat fifty to fifty-two people each.

EMPLOYMENT OF ADDITIONAL MEN—FRONT-END FARE COLLECTION

The exposition travel also compelled us to employ about 400 extra platform men, eight front-end collectors and sixteen inspectors, thus increasing our transportation force from 375 to about 750. I

might add here that the use of front-end collectors, with San Francisco registers, has proved exceptionally beneficial. This practice not only speeds up fare collection and the loading of cars, but causes strangers to direct their inquiries at the collectors on the street rather than blocking car platforms while talking to the conductor. The front-end collectors also act as starters. At the main gates of the exposition the use of front-end fare collectors enables us to keep the cars on headways of fifteen seconds and even less.

Owing to local charter provisions all employees had to be hired by way of the civil service. The nature of the educational and physical examinations for platform men and inspectors has already been detailed at length in your issues of Sept. 5, 1914, and Nov. 14, 1914. Out of 3000 applications for platform jobs, 554 men passed the final examination in arithmetic, rules, etc., as motormen and 633 as conductors. Of the 140 candidates for inspectors, not more than seven passed the quiz of December, 1914, but fifty-six passed the examination held in April, 1915. All platform men work an eight-hour day and receive a minimum of \$3, or 37.5 cents an hour, with time and one-half for overtime. Inspectors receive \$115 a month with one day off per week.

In the original examination for the first Geary Street men and in the December, 1914, and April, 1915, examinations the employees were all experienced railroaders. The second of the later examinations, however, brought a great majority of inexperienced men. The reason for this was that we made a large reduction in the credit for experience. This brought the desired increase in younger men and better physique. About 400 of this class are now at work.

We have been very fortunate in regard to accidents, in view of the fact that new men have been dealing with a riding public which naturally has a

large proportion of strangers. On some days we carried 225,000 people without serious mishap.

It is a peculiar fact that the stream of travel within the exposition grounds does not take the course almost everyone expected. It was the general belief that most visitors would enter via the main gates at Fillmore and Scott Streets, on Chestnut Street, the thought being that they would see the large palaces first and then leave through the zone section. In practice the use of the gates has not followed any definite course. Both the United Railroads and the Municipal Railways have found, therefore, that the terminals built at Van Ness Avenue and Fort Mason respectively were not entirely necessary, especially as the front-end fare collectors do so much to speed up the traffic.

A most agreeable surprise of exposition travel is that the visitors straggle in and out of the grounds leisurely, so that peaks are handled with more ease than in the ordinary American rush hour.

Outside of the service given by both street railway companies, the San Francisco-Oakland Terminal Railways gives a direct rail and ferry service from its territory, so that patrons from Oakland, Alameda, Berkeley and other transbay communities can visit the exposition without using San Francisco cars. On special days the Northwestern Pacific Railway gives a similar service from Sausalito. In San Francisco itself the street railways have to compete with 10-cent jitney service and 10-cent double-deck bus service. The number of jitneys running to the exposition is about 125 and the number of buses about a dozen. It is an illuminating fact that some of the buses came from Los Angeles and other towns where they had failed to pay in every-day transportation. Thus, with the various sources of competition enumerated, not forgetting the private automobile, the street railways are having no difficulty in handling all the business they can get.

Municipal Railway Car at the Scott Street Entrance to the Exposition

Reduction in Power Cost Effected by the Use of Coasting Recorders

The Greatest Value of Car-Checking Devices Is Declared to Be the Improvement in All-Around Work of the Men

By W. R. ALBERGER

Vice-President and General Manager San Francisco-Oakland Terminal Railways

THE use of the Railway Improvement Company's coasting recorders on the cars of the San Francisco-Oakland Terminal Railways has resulted in a very satisfactory decrease in the cost of power consumed in operating cars. By this I do not mean to say that the mere installation of the coasting recorder has resulted in a saving of power, for such is not by any means a fact. Reduction in consumption of power has been brought about through the use of coasting recorders in enabling the company to keep a record of the performance of its various motormen and to keep all concerned advised as to the efficiency of each man.

The desirability of some method of checking the performance of motormen has been recognized for some time. Electric railway companies have, without exception, spent large sums in various devices for checking conductors in the handling of fares and transfers, but very little has been done toward the checking of motormen who are handling equipment worth many hundreds of dollars and who are also responsible for the lives and safety of their passengers. Any device which would enable the officers of a railway company properly to check and keep track of the performance and efficiency of motormen is, in my opinion, a most valuable adjunct to the economical and safe operation of electric railways.

It can be scarcely expected, under the limitations of human nature, that a man will be as careful and conscientious in his duties knowing that there is no check whatever upon his actions as he will when he is aware that there is a careful watch kept upon him, and that his superiors will know positively whether or not he is exercising due diligence in the discharge of his duties. Hence the benefit to be derived in the use of the coasting recorders is not entirely through the operation of the recorder itself—it is through the securing of reliable information by the instrumentality of the recorder as to the manner in which a motorman is operating his car and in his own knowledge that his record is reported to and closely scanned by the officers of the company as well as by his own mates.

The experience of this company has been that in keeping the principles of coasting before our motor-

men many other points in connection with economical and safe operation of cars are naturally brought out. Our records show very clearly that motormen with good coasting records also show good records on other matters as well. It seems quite evident that the fact that a motorman's performance is being recorded tends to keep his mind upon his work, to the end that he not only secures a good coasting record but handles his car better in every way and is much more alive to the safety of his passengers. If the coasting alone were the result of the installation of recorders I would not feel that they were entirely successful, but the general improvement in the efficiency of the motormen of this company since the installation of the recorders convinces me that this method of checking motormen is an exceptionally good one, and I believe that there can be no question whatever as to the desirability of a check upon the performance of motormen.

The cost of power used by this company for operation of cars has been decreased from 15 per cent to 20 per cent since the installation of coasting recorders, in addition to which there has been an appreciable reduction in the cost of brakeshoes and also in the cost of maintenance of electrical equipment. All of this, I believe, is due to a more careful and more intelligent handling of equipment by our motormen, which improved handling is due to an awakening of their own ambition to make good records, as well as to the general instructions which they have received in connection with the special instructions regarding coasting.

As stated before, the mere installation of coasting recorders will not alone produce results. A constant follow-up course and constant supervision and instructions to motormen are necessary. Without question all electric railways spend considerable money on inspectors for motormen, and it is my belief that reports secured through coasting recorders act as a guide to the inspectors, giving them the necessary information as to what motormen need instruction and the sort of instruction required.

The expense of maintaining recorders and maintaining the office force necessary for keeping the records and making reports is nominal and should not in any way be considered in connection with the benefits derived.

Central District, Route 19

13th Ave. South

on	
----	--

Special instructions.
On single track inward cars are superior to outward cars See rule 72
Inward cars will proceed on time if the Electric Signal shows clear block
Outward cars if their regular meet has not been made will wait one minute over their time and proceed if signal shows a clear block.
Observe closely rules 253 & 266
If the electric signals fail inward cars will wait 5 minutes at meeting points & proceed as prescribed by rule 90 Outward cars if unable to make clearance in time allowed will be governed by rule 87

Use the No. 2 and Slow running time leaving Wash. St. from 5.07 to 6.14 P. M. inc. & leave 8th Ave. from 4.37 to 6.14 P. M. inc. Otherwise use the No. 1 and Fast time

San Francisco-Oakland Terminal Railways' Way Standards

By GEORGE H. BINKLEY

Chief Engineer Maintenance of Way and Structures Department

Pier Terminal Yard, Showing New Construction with 2-Mile Fill

THE San Francisco-Oakland Terminal Railways operate a system of tracks in nine municipalities and two counties on the east side of San Francisco Bay with a ferry connecting the East Bay Cities and San Francisco. All of the cars are operated by electricity, but some of the lines are doing a strictly street railway business, while others are in the nature of interurban lines, handling both freight and passengers, requiring track construction for M. C. B. equipment.

Owing to the requirements of so many municipalities and the varied character of service, it has been impossible to adopt standards of construction to apply to the entire system. Generally speaking, the recommendations of the American Electric Railway Association have been followed in the construction of tracks and paving.

EXCAVATION AND DRAINAGE

Trench excavation as a rule has been made by hand, loading material on cars or wagons, but recently good results have been obtained by using a Brown hoist and a small steam shovel, materially reducing the cost of loading excavated material. Where a trench is located in the streets, it is the custom to scarify the macadam surface.

Most of the tracks are laid in a clay soil, and because of the character of the soil it has been deemed advisable in all recent work, whether under a concrete mat or stone ballast, to install a drain tile connected with the city sewers. Most of the drain pipe installed is 4-in. farm tile, but in one case second-class vitrified conduit was used. Most of the tiling is laid under the center of the space between the two tracks. In laying this tile a trench is excavated, approximately the width of a shovel,

and the space around the drain is filled with clean crushed stone. Where concrete is to be used for the track foundation, a strip of roofing paper is laid over the drainage ditch in order to prevent the wet concrete from filling voids in the stone surrounding the pipe. Where practicable, a power roller is used to roll the subgrade, but in some cases, owing to the presence of service pipes near the bottom of the trench, it has been necessary to use a light horse roller.

CONCRETE FOUNDATIONS

For some years past, concrete beam construction in different forms has been used to some extent, but in recent construction a 6-in. concrete mat has been laid, the concrete for all track construction being a 1-3-6 mix. Where the density of traffic is so great that it is not practicable to remove track in order to place a concrete mat, from 6 in. to 8 in. of stone ballast is placed under the track and thoroughly grouted.

Material for concrete is hauled to the street by cars. The concrete is mixed by an Austin two-sack cube mixer, operated by steam and burning oil. This machine is mounted on wide-tired wheels, running on the street. The mixer is charged with a one-sack batch, but when laying paving foundation under traffic, and the machine cannot discharge during the passage of cars, a second batch is mixed, so that as soon as the car is clear the machine discharges two batches, thus materially increasing the output of the machine. There has never been a time when it was possible to have trench or track work completed far enough ahead to work the mixer to its full capacity for an entire day.

The mixer is self-propelled, but carries no large

water supply and moves slowly, so that in moving from one job to another it is hauled by team or by means of a gasoline road roller. Owing to its weight long moves are somewhat trying on the machine, and for that reason two machines are in service, located in different territories.

In order to avoid absolute rigidity and to obtain some degree of elasticity, the top of the concrete mat is laid 2 in. below the bottom of the ties, and the ties are tamped with dry concrete, no water whatever being used in the mix. This dry concrete, however, absorbs moisture from the paving foundation of wet concrete when it is laid and hardens somewhat, although there is no difficulty in loosening it with picks in case of repairs or reconstruction. This concrete mat with dry concrete tamping material has proved successful so far, even when 70 lb. A. S. C. E. relayer rail was used.

Three accompanying drawings show the general style of construction, using the 141 lb. Trilby rail, 6-in. 60-lb. T-rail and 70-lb. A. S. C. E. rail.

BALLAST

On the Traction lines, where the traffic is not dense and where lighter cars are operated, the tracks are laid on 6 in. of stone ballast, under which drain tile has been installed and the sub-grade rolled. The tracks on which there is inter-urban service are ballasted with 12 in. of crushed stone. There are several stone quarries in this vicinity, and it is possible to obtain excellent ballast at a reasonable cost. All ballast is bar tamped.

TIES AND RAIL

For standard construction 6-in. x 8-in. x 8-ft. split redwood ties, spaced 2-ft. centers, are used; under crossings pine timbers of large dimensions are used. Ties are not treated, as in stone ballasted track the mechanical life of the tie governs, and where laid in concrete it is assumed that the life of the tie will equal the life of the rail.

In laying these split ties, it is necessary to adze them in order to obtain a uniform bearing and good alignment with 9-in. rail. Where tie plates are used, they are placed by means of a plating machine in the yards, but no tie plates are used in the concrete construction. An effort is made to have on hand at all times sufficient ties to permit proper seasoning before laying.

Like a great many other roads which have been in operation for a number of years, this company has rails of various sections, as follows:

- 70-lb. A. S. C. E. in 33-ft. lengths.
- 6-in. 60-lb. T in 60-ft. lengths.
- 7-in. 80-lb. T in 60-ft. lengths.
- 9-in. 106-lb. Trilby in 60-ft. lengths.
- 9-in. 125-lb. Trilby in 50-ft. lengths.
- 9-in. 141-lb. Trilby in 45-ft. lengths.

The 9-in. Trilby rail has been used to satisfy the requirements of municipal authorities, but, except under conditions of very dense traffic, good results have been obtained with 6-in. 60-lb. T-rail.

Specifications recommended by the American Electric Railway Association as to chemical composition have been followed in purchasing rail. There has been no serious trouble from corrugation. Where rail has become badly worn or cupped at the joint, material has been replaced by electric welding and ground, using a Kerwin power grinder operating on the track.

Practically all of the track is laid on tie plates, and for some time the shoulder tie plate has been used exclusively. As previously stated, tie plates are omitted with concrete construction. Standard spikes are used, there being no screw spikes in the track. Flat tie rods are used with all rail except the 70-lb. A.S.C.E. section, where no rods are used.

JOINTS AND SPECIAL WORK

When constructed, a considerable portion of the track was laid with angle bars, and these have been replaced largely by Continuous joints. All new work has either Continuous joints, or the rails have been electrically welded.

During 1914, this company welded about 6000 joints on different sections of rail, most of the welding being done on old track. This was the first use of the Lorain process west of Lincoln, Neb. The total failures to date on all sections of rail under varying conditions of track and rail have been 0.8 per cent of the number of joints welded.

The Vixen rail planer is used when installing new Continuous joints on new rail. The Continuous joints used are as follows:

- For 70-lb. A. S. C. E., four hole, 26 in.
- For 6-in. 60-lb. T, six hole, 26 in.
- For 7-in. 80-lb. T, six hole, 26 in.
- For 9-in. 125-lb. Trilby, eight hole, 24 in.
- For 9-in. 141-lb. Trilby, eight hole, 24 in.

On the Traction lines with frequent service, insert manganese centers have been generally used, although there is some solid manganese. Split switches are used in open track where provision must be made for M. C. B. flanges. Where such cars operate in streets, double-tongue manganese switches with a radius of 350 ft. are installed.

Crossings maintained by this company are built-up crossings, or have manganese centers. Built-up crossings and frogs for open track are constructed in the company's shops. Where renewable centers have been used in crossings and special work, they have not always remained tight, and there has been some trouble from breakage. In some cases this is perhaps due to the fact that the manganese castings are not heavy enough to stand up under the traffic requirements, but the failures are nearly

Typical Cross-Sections—At the Left, Shattuck Avenue from Ward Street to South City Limits, Oakland; at the Right, Twelfth Street from Broadway to Fallon Street, Oakland

always where crossings or special work are designed to accommodate the use of different sized wheel flanges, thus prohibiting the installation of flange risers. Where special work is not flange bearing at crossings the receiving section breaks or wears, and the paving deteriorates rapidly.

Specifications are being prepared with the idea of establishing a standard for all heavy traffic of 9-in. solid manganese construction for special work and crossings. In installing such work, special attention will be given to the preparation of good foundations, and it is believed that the manufacturers are now producing a better quality of manganese castings than formerly.

The recommendations of the American Electric Railway Association are being followed as to the length and radii of switches and mates.

Spirals are used on all curves, and the minimum radius is 55 ft. All double track curves are designed so that cars will clear, excepting where the streets are so narrow that this is impossible.

PAVING

Practically all of the paving on this system consists of two kinds—oil macadam is used in outlying districts, and on main thoroughfares standard asphalt paving consisting of a 6-in. concrete base, on which is laid a 2-in. binder course with a finish surface of 1½ in. of asphalt. Recently there has been a movement for the use of bitulithic pavement, consisting of a 2-in. course of bitulithic laid on 5 in. of concrete or on a macadam base.

This company does practically all of its oil macadam construction and repair work, the principal exception being when the street is being improved by a municipality, when the pavement outside of the tracks is done by the contractor for the street. For this work, covering more than 100 miles of single track measurement, there is an equipment consisting of a wagon oil spraying outfit, a car oil spraying outfit, and three 12-ton three-wheeled gasoline road rollers. The oil macadam pavement is serviceable and easily kept in repair, but is not adapted to heavy vehicular traffic, and at times during the warm weather there is too much oil on the surface.

In the selection of paving in its tracks, this company is governed by the State law, which specifies that the tracks must be paved with the same character of paving as is used on the rest of the street, so that very little latitude is allowed, although in some cases a municipality permits the use of a pavement differing somewhat from the adjacent paving.

The company has a stationary asphalt plant of a capacity sufficient to manufacture all asphalt paving material for its own use, and is doing all of its own paving with the exception of the strips laid by

the street contractor, as in the case of oil macadam, this arrangement being made in order to eliminate the paving joint alongside of the tracks.

The Railroad Commission of California has ruled that the minimum distance from center to center of double track in streets shall be 11 ft. 6 in., and the State law requires all companies to pave 2 ft. on each side of its tracks, so that in all cases it is necessary to pave this strip, at least 20 ft. in width.

In carrying out asphalt street improvements, the manufactured product is hauled from the plant in steel side dump cars, having a capacity of 5 cu. yd. This permits delivery of the material at the proper temperature, as it can be delivered in this manner in large quantities, and much more quickly than by wagon or truck. Rolling is done by use of an oil-burning steam tandem 5-ton roller, which has been weighted so as to give a compression of 250 lb. per linear inch, a 5-ton roller being selected for this purpose because of its having a roll 29 in. in length, which permits it to operate between rails.

Liners of three kinds are used, asphalt brick, vitrified brick, and basalt stone. The asphalt brick liners have not stood up under traffic and the vitrified brick have not been entirely satisfactory, as there is a tendency to break along the rail, and the basalt liners do not make a smooth pavement, nor can they be used except with a high rail. A special vitrified brick with a depth of 3½ in. has been used with the 70-lb. A. S. C. E. rail. Liners are laid as headers in cement grout.

In the most recent installation of Trilby rail liners have been omitted, and so far this seems to be satisfactory.

Owing to the reduction in the number of steel-tired vehicles using the streets, and the fact that the company has its own asphalt plant and can readily and cheaply make paving repairs, it would seem advisable to omit liners under all conditions except at intersections carrying maximum traffic.

BRIDGES, TRESTLES AND CULVERTS

There are two subways on the system, both of which require daily pumping, but there are no large bridges or long trestles aside from the double-track trestle at the Pier Terminal, which extends at present 3 miles from shore (the longest trestle of its kind in the world). A solid fill for 2 miles of this distance is now under construction, this being the limit for which the federal authorities will allow a solid fill to extend into the bay.

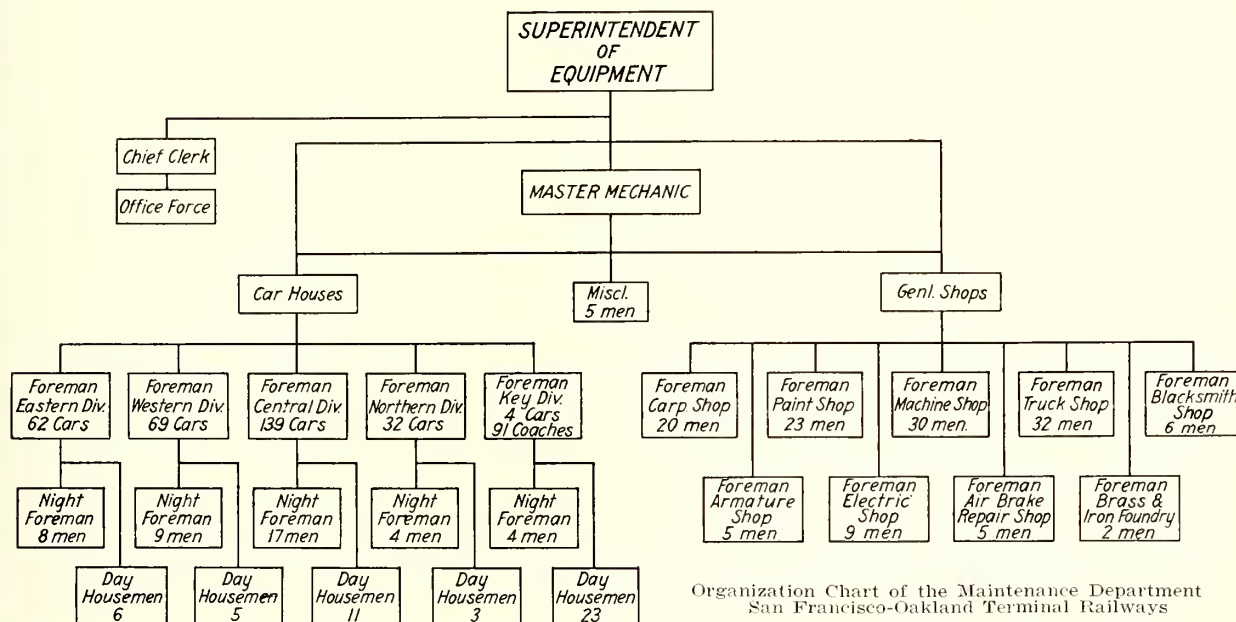

Culverts installed under the tracks in paved streets are in most cases metal arch culverts of the same design as used by the municipalities, but in some cases where low rail is used in paved streets, in order to obtain clearance, concrete culverts with the upper part constructed of 40-lb. rail and concrete have been used.

Car Maintenance on the San Francisco-Oakland Terminal Railways

One Feature of the Cost Keeping Is that All Work of This Kind Is Concentrated in One Statistical Organization, Which Gives the Engineering Departments Any Desired Information on Demand

By **GEORGE ST. PIERRE**

Superintendent of Equipment San Francisco-Oakland Terminal Railways

THE San Francisco-Oakland Terminal Railways department of car maintenance and construction has charge of 402 passenger cars which average about three motors per car, and about seventy miscellaneous work motors, freight and service cars. Work is also done for outside departments, as on buildings, manufacture of frogs and crossings for the track department, construction of overhead material and manufacture of miscellaneous material of all sorts on store department orders. Further, we maintain five ferry steamers.

As the average location of car equipment is but $4\frac{1}{2}$ miles from the general shops all heavy repair work is done at the shops, inspection, cleaning and light repair work only being left for the carhouse forces to do.

When cars are in operating condition advantage is taken of the central location of the shops to route shop cars as trippers from outlying divisions to the central part of the city in the mornings and vice versa in the evenings.

RUNNING INSPECTION AND OVERHAULING

At the carhouses each car receives a running inspection daily, special attention being given to brakes, motor bolts, etc. Controllers and trolleys are lubricated every third day. General inspection

and lubrication are on a mileage basis, 800 to 1500 miles being allowed between inspections according to the class of equipment. Car cleaning is done on a time basis, but cleaning periods are made to coincide with inspection periods whenever possible.

Cars are brought into shops for varnish and body overhauling every fourteen months.

Overhauling is on a mileage basis. Obsolete type motors are overhauled every 15,000 to 20,000 miles; semi-modern motors 50,000 to 75,000 miles and modern motors every 100,000 to 130,000 miles. Air compressors are overhauled on an average every 100,000 miles. These overhauling mileages are not arbitrarily adhered to, but are made to coincide whenever possible with the painting and body overhauling. We have some equipments which are varnished twice while the motors are overhauled but once.

STATISTICS

The company maintains a statistical department by which statistical information of any nature required is furnished to any other department on request. The several departments furnish the original information to the statistical department in the form of properly segregated charges on time cards and material requisitions.

Standard Passenger Car Truck Built in the Shops
of the San Francisco-Oakland Terminal Railways

The concentration of this class of work into one organization operates satisfactorily, and no doubt brings a considerable saving over the old method wherein each separate department maintained its own statistical organization. Thus the maintenance of equipment department receives from the department of statistics monthly comparative statements giving maintenance costs, total and per 1000 car-miles, on car bodies, trucks, painting, air brakes, accidents, headlights, gongs, fenders, wheel guards, broken glass, grinding wheels, route signs, coasting clocks and fare boxes, all chargeable to account No. 30; while on account No. 33-A detail charges are received giving separate costs per 1000 car-miles on each of the ten different types of controllers and the cost per 1000 motor-miles on each of the thirteen different types of motors. Costs per 1000 car-miles are also given on miscellaneous control equipment, pantograph trolleys and pole trolleys.

Reports are also received for each carhouse giving total costs per 1000 car-miles for lubrication (labor and material in detail) car cleaning, sanding, inspecting, switching, signing, changing cars on road, advertising, dispatching, testing fare boxes, reading fare registers, inspecting coasting clocks, fire drills, incandescent and arc lamp supplies, trimming headlights, inspecting alarm gongs, lamps and markers and general carhouse expense. Details are also given for the amounts which are spent

on regular maintenance work at the various carhouses.

Monthly meetings are held with all foremen wherein these statements and other matters pertaining to department efficiency are considered.

New men hired for carhouses receive a few months' training in truck and motor repair work at the company's general shops before being assigned to the carhouses.

SHOP AREAS AND EQUIPMENT

The main shops, built in 1904, consist of twelve buildings of wood frame and galvanized iron construction, including: Carpenter shop, 100 ft. x 200 ft., with twelve tracks—capacity eighteen cars; mill, 60 ft. x 100 ft. equipped with woodworking machinery necessary for car building and general repair work; paint shop, 100 ft. x 200 ft.—thirteen tracks inside and four wash tracks outside, capacity about twenty cars of various sizes; truck shop, 100 ft. x 200 ft.—fourteen tracks, capacity seventeen cars of any size. We have eleven motor-driven car hoists capable of raising eleven of the largest cars at one time, and all tracks are served with air hoists on jib cranes for truck and motor work. The building serving the machine shop, armature and air-brake departments is 70 ft. x 200 ft. and is equipped with air hoists or jib cranes and traveling trolleys where necessary.

Maintaining Proper Relations Between a Railway and Its Car Men

*Verbal and Written Communications to the Men Have Proved to Be
Very Effective in Promoting Appreciation of the Operating Rules*

By **GEORGE H. HARRIS**

General Superintendent San Francisco-Oakland Terminal Railways

THE San Francisco Oakland Terminal Railways realizes that no other one thing is more productive of satisfactory operation, both from the standpoint of the company and the public, than a proper understanding on the part of the car men as to what is expected of them in carrying out the rules and regulations of the company.

In order to keep the men fully informed in this respect our company has for some time held periodical meetings for the car men in a schoolroom specially provided for the purpose. At these meetings short talks on matters pertaining to operation are made by the chief instructor, division superintendents and other officials, after which the car men present have an opportunity to bring up and discuss any subject of interest.

These discussions frequently result in bringing out valuable suggestions from the men and give to them an opportunity to present their viewpoint on any subject under discussion.

In addition to these meetings it has been the practice for some time to issue monthly pamphlets which are distributed to the men with their pay checks. These pamphlets are of a size convenient to be carried in the pocket, and deal with various subjects of operation, such as: "Courtesy," "Service," "Co-operation," "Slippery Rails," "Accidents," "Coasting," "Safe and Comfortable Operation,"

etc. This method of getting important points of operation before the men has also proved effective, notably in the case of a pamphlet on "Coasting."

It is a well-known fact that with the installation of coasting clocks, if the motormen are not properly instructed on coasting they are likely to get an entirely erroneous idea of the manner in which a car should be operated to obtain the desired results. All cars of this company are equipped with coasting clocks and at the time of installation every effort was made fully to instruct the motormen on coasting. First two, then later one coasting inspector has been regularly employed to look after this work, but with a large number of cars in operation the instructor is not able to get around to each motorman at close intervals. As an aid to this important work a "Coasting" pamphlet was issued.

In this pamphlet the more important points in connection with coasting were briefly set forth, serving the motorman as a rule book, as it were, to which he might frequently refer. It was found that this pamphlet was of much benefit in bringing to the attention of the motormen the proper manner in which a car should be operated to obtain the greatest amount of coasting. In this case also, as with other similar pamphlets, a better understanding with the men was obtained.

The spirit in which our pamphlets are written

is exemplified by the following extract from the one issued in February in connection with the exposition:

"To Motormen, Conductors and Collectors:

"During the present year the company will be called upon to handle an increased number of passengers, on account of the Panama-Pacific International Exposition, many of whom will come from all parts of the United States and foreign countries.

"These visitors will not be familiar with the city, or car routes, and they must naturally look to some one *who knows* to direct them to their desired destination, and to the various points of interest in and around the East Bay cities.

"It is to this class of patronage that I wish to draw your special attention at this time. The strangers in our city will look to the car men more than to any other public employees to give them information about the city, and to direct them how to reach any point therein. May I therefore impress upon each of you the importance of thoroughly familiarizing yourselves at this time with the various car routes operated by the company, and the territory into and through which each line runs, so that *you* will be the one *who knows* and can direct the stranger?"

"In addition to the service now in operation the company will inaugurate and maintain during the exposition period a direct ferry service between the Key System pier and the exposition grounds. A heavy expense has been incurred in preparing for this service and we want your full co-operation in making it a success.

"To derive the greatest benefit from this service and to make it entirely satisfactory to the public, cars, trains and boats must be operated on schedule as near as possible; the public must be able to readily obtain information relative to the service, and it will be *you* from whom they will naturally expect to be able to get the information desired."

As a rule it is not a difficult problem to obtain satisfactory service from car men, and to have the most cordial relations exist between them and the company, provided they are properly instructed as to their duties when first starting to work and also if they are followed up by interesting methods of bringing the more important points of operation before them, somewhat along the lines described. Under this plan it has been observed that a majority of the men make an effort to concentrate their minds on the work and endeavor to carry out their duties in an entirely satisfactory manner.

Building Up Local Pleasure Travel to Points in the East Bay Cities

Co-operation with Privately-Owned Parks Is a Regular Feature—Special Provisions Have Been Made to Facilitate Direct Travel to the Exposition

By J. H. BROWN

Traffic Manager San Francisco-Oakland Terminal Railways

THE development of pleasure travel on the urban and interurban lines of the San Francisco-Oakland Terminal Railways is retarded to a certain degree by the geographical location of the cities served on the east side of the Bay of San Francisco, the movement of the pleasure traveling public being toward San Francisco. This condition is not dissimilar to the condition prevailing in other territory contiguous to a large city.

San Francisco, with her beautiful parks, ocean view and bohemian life, offers inducements to all classes of the public and affords competition that our local pleasure resorts meet only to a certain degree. Different inducements are offered local pleasure travelers to influence their trips between various points in the East Bay cities.

This company maintains a beautiful park adjacent to Richmond to which free admission is given to all organizations, except such as desire the exclusive use of the park or charge an admission thereto. No liquor privileges are permitted in this park, an arrangement which is very popular with Sunday schools and fraternal organizations of San Francisco and the East Bay cities. Thereby, in a way, we offset the regular pleasure travel toward San Francisco.

Oakland and her sister East Bay cities maintain and support a number of the best equipped children's playgrounds on the Pacific Coast. These, to a certain extent, influence pleasure travel during the school vacation period.

In addition to the foregoing pleasure resorts there are a number of privately-owned picnic parks, some with and some without liquor privileges. The managements of such parks, of course, have their regular bookings of picnic parties, and our traffic department co-operates with them in every way possible, thereby assisting them in securing bookings with the result that, to a certain degree, these resort managers act indirectly as passenger agents for our company. As a medium of making friends for the company, I believe this policy of dealing with privately-owned parks is a good thing.

INVITING TOURISTS TO SEE US

San Francisco has always been a magnet for the tourist travel, and with the Panama-Pacific International Exposition located in her boundaries this year she offers a greater attraction for tourists than any other city in the United States. The method of inducing a large number of these tourists to cross the bay and visit the East Bay cities is

Tea House at Piedmont Park

A View in One of Oakland's Public Parks

being worked out through the co-operation of Alameda County, the various civic organizations, hotel association and this company by the distribution of attractive advertising matter and personal solicitation by the various organizations mentioned.

In addition to its large exhibit at the Panama-Pacific International Exposition, the county maintains exhibits and information bureaus throughout various Eastern cities, at the San Diego Exposition and Los Angeles through which the advantages of the East Bay cities receive publicity.

For the Panama-Pacific International Exposition tourists, this company has established a special visitor's ticket good for transportation direct from the exposition grounds to and through various points in Oakland or Berkeley and return to San Francisco proper. These tickets are on sale only at the exposition grounds and receive publicity through the medium of a pictorial folder containing a bird's-eye view depicting an area of approximately 75 square miles of the territory served by our lines. This folder also contains a number of photographic reproductions of points of interest in the East Bay cities, with complete information regarding various car lines serving such points.

In the printing of such folders we have used a soft tone of green color on a white background, thereby avoiding strong and distinctive colors. The soft color tones used have met with many favorable comments from the public.

As the San Francisco-Oakland Terminal Railways is the only company operating a direct ferry service between the cities of the east side of San Francisco Bay and the exposition, we are often called upon to handle peak loads which are subject to attendant congestion at ticket agencies, inasmuch as no exposition tickets are sold on our cars. To avoid possible congestion at agency points, we have our tickets on sale at many hotels and business houses, the proprietors of which act as our ticket agents without remuneration. The popular demand for such class of tickets carries with it an advertising value to such agents, and in all cases we have found them very glad to offer such an accommodation to their guests or customers. As these selling agencies are distributed in such a manner as to cover practically all main-line points we are enabled to handle large crowds with little or no congestion at any one ticket office.

At our pier terminal we have constructed a large waiting room with twenty-five entrances, arranged in such a manner that we can handle any size crowd without delay. Exposition passengers pass from this waiting room through exit doors, where count is made, and board boats. We are thus enabled to keep an exact count of passengers boarding boats and also to close the exit gates immediately upon loading a boat to its maximum, thereby avoiding overloading any boat. The patronage of this service bespeaks its popularity.

Signal Operation on the Oakland, Antioch & Eastern Railway

By F. A. MILLER

Superintendent of Power and Equipment

THE Oakland, Antioch & Eastern Railway is a purely interurban high-speed railway operating out of Oakland for 85 miles of route east and north to Sacramento. At Oakland we have trackage rights over the lines of the San Francisco-Oakland Terminal Railways so that we can run cars to that company's ferry terminus.

The greater part of our line is, of course, single track with sidings at intervals varying from 2 to 5 miles. Our passenger trains are run up to a maximum speed of 62 m.p.h., although our cars are geared for 55 m.p.h. Trains consist either of motors and trailers or of locomotives and trailers. We also have extra fare parlor buffet cars with porter service. The locomotives are used chiefly for special excursion service as they can haul five 60-ft. sixty-seat cars at 57 m.p.h. on level track. Westinghouse 600-1200-volt motors and HL control are used throughout.

Between Oakland and Bay Point 30 miles distant we operate a mixed through and local service; beyond that point to Sacramento all passenger trains are of through character, connecting with the Northern Electric Company at Sacramento, where parlor cars are attached to trains of that company, thus giving through service to Chico, 180 miles from Oakland. We operate also four branch or feeder lines on which we give local passenger service.

Our freight service is so arranged that one local

train is operated between Oakland and Bay Point and another between Sacramento and Bay Point, which is our place of car and l. c. l. interchange with the Southern Pacific and Santa Fé Railways. At Oakland we interchange with the San Francisco-Oakland Terminal Railways and at Sacramento with the Northern Electric Railway. The freight trains, which are hauled by electric locomotive, leave Oakland at 8.50 p. m. and Sacramento at 6 p. m. respectively, meeting at Bay Point. The freight train for Oakland reaches that city by 4 a. m., and the Sacramento train reaches its depot about 5 a. m. The last passenger train leaves Oakland at 8.30 p. m. and the first morning train does not leave Oakland until 7.50 o'clock, so that there is no interference whatever with freight. On the other hand, the last passenger train out of Sacramento leaves at 7 p. m., overhauling the out-bound freight at Headquarters siding. In the morning, however, the freight and train has returned to Sacramento two hours and fifteen minutes before the first passenger train leaves. Freight trains run up to 35 m.p.h.

In general, our through passenger trains are run on a two-hour headway and local trains on the hours between. Therefore, between Oakland and Bay Point we have one train an hour each way, but the limited trains each way, one in the morning and one in the afternoon, do not stop in the entire run of 85 miles between Sacramento and Oakland. The lim-

iteds make this run in two hours forty-five minutes exclusive of four minutes' running time on about 0.39 mile of city track in Sacramento.

CHOICE OF SIGNALS

The present signal system was completed in May, 1914, following the extension of the original Oakland & Antioch Railway from Lafayette to Oakland, at which time the service was altered from suburban to interurban type. The original line had no signals whatever. The system now in use was furnished by the Union Switch & Signal Company, both for the section between Oakland and Bay Point and the last extension completed September, 1913, to Sacramento. This signal installation is the only a.c. track-circuit system in the vicinity of San Francisco which uses light signals.

The signal system is operated by sixty-cycle current which is supplied to the signal mains at 2200

volts at Eastport and Concord for the signals from Oakland to Mallard, and at Dozier or Lisbon for the signals from Chipps to Sacramento. At Concord current at 2200 volts is available, but at the other places two transformers are installed to step down the voltage from 11,000 to 2200. A double-pole, double-throw oil circuit breaker connects either transformer to the line.

The transformers at Drawbridge substation are not in use on the signal system at the present time. At signal locations and cut sections 0.6-kva. transformers supply current at 110 volts for relays and signals. Adjustable-core transformers feed the track circuits at the center, though about twenty less than 4000 ft. in length are end-fed. All spurs have a light switch indicator to show when a train may enter the main line. Sidings having one set of home signals are provided with light switch indicators at the east ends; sidings having two sets

Performance Sheet Showing Character of Defects Repaired by Maintainers

of home signals are provided with light switch indicators at both ends.

Signals are hung on cedar poles, 25 ft. long, 7-in. tops, shaved and painted. All wiring is carried down poles and underground in redwood trunking and galvanized conduit. Bonding at switches and frogs and connections to impedance bonds are No. 0000 D. B. W. P. stranded copper.

Track circuit wiring is No. 6 copper, rubber-covered, and all connections between line wires and signals and relay boxes are made with No. 12 and No. 14 copper, rubber-covered. Spare wires are drawn through all conduits. Distant signals (non-automatic) placed 1000 to 2000 ft. in advance repeat the indications of their respective home signals. The overlaps favor west-bound trains; they vary in length from 300 ft. to 400 ft.

Two No. 6 bare copper wires for the signal mains and three No. 10 D. B. W. P. copper wires for common and east and west-bound control were strung by the line department. Distant signal and switch indicator wires were strung by the signal department. The number of miles protected is 85; the number of home signals, 117; the number of distant signals, 90; and the number of crossing signals operated in conjunction with signal system, 14.

BEHAVIOR OF SIGNALS

We have approximately 300,000 signal movements per month, and our averages for the twelve months from May, 1914, to May, 1915, show as follows:

Total train stops.....	7.3
Total failures	9.07
Number of stops per 100,000 indications.....	2.02
Number of stops per 100,000 indications due to signal department	0.5

The signal system auxiliaries comprise fourteen automatic flagmen highway crossing signals which are operated from the track circuits. They ring a bell, swing an arm and show red and white lights. The flagmen originally were operated from the 1200-volt d.c. trolley circuits, but we found that the

maintenance costs would be decreased by using alternating current at 110 volts in place of 220 volts direct current. The flagmen were furnished by Bell & Jamison, Los Angeles.

Three men are employed exclusively for the maintenance of all signals and telephones. Each man has approximately one-third of the mileage to inspect and maintain. Gasoline cars of Mudge type are used to get over the line quickly. It may be added that we began with four signal maintainers, but increasing experience leads us to believe that two men will suffice in the near future.

The maintainers must report to the dispatcher every hour, thus furnishing an account of their movements and giving the dispatcher the information needed to enable him to locate the maintainers quickly in case of telephone trouble and the like.

The principal trouble experienced is broken and burnt-out lamps, this amounting to about two per month. To minimize such failures each signal location is supplied with a signal lamp record (illustrated) which shows the period the lamp has been in service. We use a 112-volt 25-watt GE-18½ tungsten bulb, the average life of which is four months of twenty-four hours a day. Other signal troubles are so rare that they can scarcely be called recurrent.

In addition to the regular system on our own lines we operate a Westinghouse electro-pneumatic interlocking plant with eleven active and twelve spare levers at our Oakland connection with the San Francisco-Oakland Terminal Railway.

The total maintenance cost of the track circuit signals, highway crossing automatic flagmen, electro-pneumatic interlock and telephones averages \$400 per month, including both labor and material.

Although we have every confidence in the signal system we do not feel that we would be justified in having it take the place of regular train order dispatching. Both practices in co-operation appear necessary to secure the greatest degree of safety.

Signal, Bonding and Contact Rail Notes on the Northwestern Pacific

This Company's Pioneer A.C. Track-Circuit Signal System, Installed in 1903, Has Made an Excellent Record in Maintenance—Soldered Bonds Are Also Used Successfully Despite Earlier Failures

By F. T. VANATTA

Chief Electrician Northwestern Pacific Railroad, Sausalito

THE Northwestern Pacific Railroad is one of the few third-rail lines on the Pacific Coast and the first of its kind in this territory. We operate a total of 32.6 miles of single track electrically, the rest of our mileage being steam. A peculiar feature of the service is the operation of both standard-gage steam and electric and narrow-gage (3 ft. 6 in.) steam trains, the narrow gage being formed by a third running rail as illustrated.

Because of the mixed steam and electric operation with two gages unusual signal arrangements

prevail. On the double track between Sausalito and Corte Madera all six rails are used for the railway return circuit. The narrow-gage rail is tapped into the center of the inductive bonds of the signal circuits, and the transformers and relays of the signal equipment are connected across the narrow-gage track. Ordinarily the connection would be from outside rail to outside rail, but this would not give satisfactory signaling for narrow-gage trains. The signals on this section are operated by alternating current.

Between Corte Madera and San Anselmo the two

Twelve-Year-Old A.C. Track Circuit Signals at East Portal of Corte Madera Tunnel

First Step in Moving Live Conductor Rails

common rails are used as a signal rail, the other four serving for the railway return. This arrangement was the original one for all electric track, but on this section the signal rails are not yet required to increase the capacity of the railway return. The signals on this section are direct current, operated from storage batteries in the signal cases, these batteries being charged from the third-rail.

One addition made by us to improve the efficiency of the signal system is a change in the control of the signals which govern short single-track sections, particularly of single-track or gauntlet track in tunnels. The standard signal post was cut down until the blades in their horizontal position were 12 ft. from the top of the rails to remind the

motormen that they were for a special purpose, and also to bring the operation within their line of vision from the train as they ran by. The signal which has the preliminary is held normally at danger, its control circuit being looped through a mechanical switch of the signal at the opposite end of the block section. Hence this signal cannot be cleared until the opposite signal has been brought to the stop or danger position. When a train enters the preliminary of the block section it throws the signal at the opposite end, which will allow this train's proceed signal to go to clear if there is no other train in the block.

This signal installation is notable as the first a.c. track-circuit outfit installed by the Union Switch

Second Step in Moving Live Conductor Rails

Twelve-Year Old A.C. Track Circuit Signals at Ross

& Signal Company. The first equipment, placed in 1903, was for 10 miles of double track, and this has since been extended to cover the 32.6 miles of electric track and 8 miles of the steam track. During the entire period of its service this pioneer installation has proved entirely satisfactory. To-day, after twelve years' use, the upkeep expense is not appreciably more than when the apparatus was new. On several occasions the signals have more than paid for their cost, notably in giving warning of broken rails in our 2200-ft. tunnel near Corte Madera.

We have five interlocking plants, one of which is of the General Railway Signal Company's all-electric type, two of the Union Switch & Signal Company's mechanical type and one of the latter company's all a.c. electro-pneumatic type, and one of the same company's all d.c. electro-pneumatic type.

SUCCESSFUL SOLDERED BONDS

We can also lay claim to some pioneer work in soldered bonds. Our first bonds, placed in 1903, were of the plastic alloy or mercury amalgam type. These soon went to pieces. Next we tried a short-ribbon bond which was soldered to the ball of the rail. These bonds, including the loop, were only 8 in. long over all. They were soon shaken off,

partly because of bad soldering and partly because vibration broke the short ribbons. In 1906 we adopted a third bond but stuck to the soldering principle as we felt that success would come with a better design and more experience in application. The new bond was of wire strand type with T terminals, was of 300,000 circ. mil capacity and 8 in. to 9 in. long between the centers of the terminals. This bond has proved entirely satisfactory.

As the soldered bond has lost favor during the past few years, it is proper to explain why we have retained faith in it. The failures with our first soldered bond taught us that the question of temperature during application was all-important. To apply a bond we first chip the rail and then heat

Third Step in Moving Live Conductor Rails

the chipped section just enough to permit tinning instead of trying to bring the rail to a temperature hot enough to melt the solder. The bottom edge of the bond is then held against the rail with the top edge about $\frac{1}{4}$ in. away. The gap at the top is then filled with solder melted with the gasoline torch. Heat is applied to the terminal until the solder is just warm enough to handle in the way that a plumber wipes a joint. Next the bond is straightened, and the extruded solder is wiped off, thus completing the job. Two men average eighty bonds in a ten-hour day.

A soldered bond correctly applied in the manner described has between the terminal and the rail a cushion of solder which is thick enough to absorb a good share of the rail vibrations. On the other hand, the use of excessive heat causes the solder to run down and spread until it is little more than a film. We also use soldered bonds on our contact rails, their terminals being attached to the base of the rails.

TRANSFERRING CONTACT RAILS ALIVE

Our contact rails are of the over-running type. We have made no change in them since the original 60-lb. T-rail conductors with aluminum rod and copper cable feeders on opposite sides of the rail web were installed. In 1913, however, owing to

Fifth Step in Moving Live Conductor Rails

double-tracking, we had occasion to transfer about 2000 ft. of the contact rail from one side of the track to the other. The interesting point of this work was that the rails were alive during the entire operation so that service was not interrupted. To accomplish this we first placed 9-ft. ties at right angles to and under the contact rail at intervals of 15 ft. for the complete distance. The naked contact rail was then pushed over to its new location by means of wooden priers. The gang numbered seventeen men, about twelve of whom stood about 10 ft. apart to pry over one section of rail while the others set the rail in its permanent position. The circuit was maintained with flexible insulator cable at the ends. The job was done in thirty minutes.

Maintenance of a 1200-Volt Catenary on Southern Pacific Lines

By JESSE B. NICHOLS

Supervisor Overhead Lines Southern Pacific Company, Electric Division

THE Oakland, Alameda & Berkeley lines of the Southern Pacific Company serve the Bay cities on the east side of San Francisco Bay, comprising the towns of Oakland, Alameda, Berkeley, Albany, Emeryville and San Leandro. They comprise 101.04 miles of track, or 52.38 miles of road.

The overhead construction consists of a 7/16-in. messenger and a No. 0000 grooved copper trolley wire, with a catenary hanger of the loop type, which gives good flexibility to the system. The operating voltage is 1200 volts direct current.

The center pole and span wire catenary construction is used exclusively with the exception of both Alameda and Oakland Moles, which are of bridge construction with double catenary overhead. Iron poles set in 6½ ft. of concrete are used. They are first given a coat of red lead, and a second coat of black carbon paint. The span varies from 60 ft. to 120 ft., while the bridge spans commonly are 240 ft. long.

For high-tension circuits we use a seven-strand No. 0000 copper wire with a voltage of 13,200 volts alternating current, which is installed either underground or on iron lattice poles 65 ft. above the ground, excepting the estuary crossings, which are either submarine or are installed

on towers 265 ft. high, spanning the estuary about 1200 ft. apart.

The 1200-volt direct current is distributed over the system by aluminum feeders, ranging in size from 1,000,000 circ. mil to 2,000,000 circ. mil. These are strung on bridges, towers, catenary and high-tension poles. The feeders are sectionalized at different points, thus making it possible to kill parts of the lines at a time.

Other overhead circuits consist of signal, arc, light and power, which are installed on bridges and both catenary and high-tension poles. We also maintain a private telephone system, the cables for which are installed both underground and on catenary and high-tension poles on the overhead. Telephone instruments are installed on bridges and catenary poles in the most convenient places for the use of the operating forces.

For maintenance and emergency, three crews are required for the three districts. Each crew

consists of one foreman, three linemen, one groundman, one driver and one crew caller. For tower trucks, we use two Kelly gasoline and one General Vehicle electric. Other crews required are for splicing and bonding, the former consisting of a cable splicer, helper and teamster, and the latter being composed of a foreman and helper.

Notes on Southern Pacific Electric Service in the Bay Cities

*In the Remarkable Ferry and Rail Service for the Cities
of Oakland, Alameda and Berkeley Trains Up to Seven Cars
Are Operated on Headways as Low as Twenty Minutes*

By J. C. McPHERSON

Superintendent Electric Lines Southern Pacific Company

THE passenger traffic handled via the Oakland, Alameda and Berkeley electric lines of the Southern Pacific Company is composed principally of people whose work or business is located in San Francisco, but who make their homes in Oakland and vicinity. This results in very heavy travel between 6.30 and 9 a. m. and 4 and 7 p. m., between which hours we estimate from 60 to 70 per cent of the traffic is handled. During other hours of the day and night our traffic is light, having to depend almost entirely on local business and pleasure seekers and shoppers to and from San Fran-

cisco. The average number of passengers carried per month approximates 1,800,000.

SCHEDULES

In the way of schedules, we maintain twenty-minute service between the San Francisco ferry building and Oakland Pier, and thirty-minute service between the San Francisco ferry building and Alameda Pier from approximately 6 a. m. until 8 p. m., when the interval between trains operating out of Oakland Pier is lengthened to forty minutes and out of Alameda Pier to forty-five minutes. On

Block Signal Bridge, Oakland Mole

Saturdays and Sundays twenty-minute service is maintained on the Oakland Pier lines until midnight.

Each ferryboat arriving at Oakland Pier connects with four Berkeley and two Oakland trains, and during morning and evening rush hours with one train to Alameda. Boats arriving at Alameda Pier connect with one Oakland and two Alameda trains. The size of the trains varies from one to seven cars, according to the density of travel. During the peak load about two and one-half or three minutes are consumed in loading and unloading passengers. This means that within three minutes from the time the ferryboat hits the slip all passengers have left the boat, boarded their respective electric trains to the different suburbs mentioned and gone on their way.

To meet the demands of our patrons for fast service, advantage is taken of every condition tending to expedite the movement of trains, after first, however, conserving the safety feature. A good idea of the service can be obtained by considering the schedule of our Alameda line, where a train travels 14.6 miles, 8 miles of which is through city streets and makes twenty-four stops, in a total running time of forty-five minutes. The distance between the stations varies according to density of population, but as a general rule the stations average about 1500 ft. apart.

The fare collection during periods when travel is heavy sometimes presents quite a problem, as at some points on the system it is often necessary for the collector to take up 100 fares or more, besides assisting in the supervision of passengers boarding and alighting, within a period of less than ten minutes.

Ohmer fare registers are used exclusively on the trains, the collector registering each fare separately as it is taken up. At the ferry building a standard form of ticket chopper is used. All passengers paying their fare before admission to the waiting room have access to both landings. No fares are collected on the boats.

All motormen who are used in operating the electric trains are locomotive engineers, whose seniority rights give them the privilege of working on the Southern Pacific steam locomotives out of the Oakland terminal or on electric trains. The conductors are now also taken from extra-passenger lists of the Southern Pacific steam lines. The collectors are classified as gatemen and employed as the business warrants. The best of these men are retained in the service and they are promoted to the position of brakeman after passing the examination which is prescribed by the American Railway Association.

The average train-miles operated per month approximates 250,000, while the average car-miles operated per month approximates 400,000.

Southern Pacific Electric Cars

Automatic Wigwag Danger Signal at Berkeley

Southern Pacific High-Speed Car at West Alameda Shops

Maintenance of 1200-Volt D.C. Cars by the Southern Pacific Company

By R. E. HEWITT

Master Mechanic Southern Pacific Electric Lines

THE Southern Pacific Company, electric division, since June 1, 1911, has been operating a high-speed service with 1200-volt d.c. equipments through the trans-bay cities of Oakland, Alameda and Berkeley. At this time eighty-one motor cars, sixty trailers and ten center-entrance cars are in use. Most of the motor and trail cars are 72 ft. over all, and the center-entrance cars which are used in crosstown city service between Oakland and Alameda are 45 ft. over all. The big cars are 10 ft. 5 $\frac{7}{8}$ in. over eaves, thereby making possible a triple seat on one side of the aisle and a double seat on the other side. This gives a total seating capacity of 116 in all straight passenger cars, and of eighty-eight in the twenty-nine combination baggage and smoking cars, which are 67 ft. long. All cars are of steel construction. The 72-ft. 4 $\frac{1}{2}$ -in. motor cars weigh 943 lb. per seated passenger and 1562 lb. per running foot; the corresponding trailer figures are 579 lb. per seated passenger and 929 lb. per running foot. The side sill and center the sill of all of the cars are of 7-in. channels and the floors are of corrugated steel covered with Flexolith.

Motor cars are inspected at intervals ranging from 1200 to 1500 miles, and trailers every 2000 miles. Both are overhauled every eighteen months to two years, including paint retouching.

CAR-BODY MAINTENANCE

At the time these cars were placed in service opinions were expressed in some quarters that they might prove too light. Although they are operated in trains up to seven cars with maximum speeds of 40 m.p.h. and stops as frequent as three per mile on some runs, the construction has fully justified itself in four years' operation. To confirm this statement the following incident may be recounted:

On one occasion a towerman threw the switch between two trucks of a motor coach. This veered the car in such a way that a steel trolley pole of 8-in. to 10-in. diameter at the base was sheared off at the ground line without causing more than a slight camber in the side sills of the car. A like accident at this junction would have completely cut a wooden car in two. This car was sheathed with $\frac{1}{8}$ -in. steel up to the belt rail.

Generally speaking, our only car-body main-

Southern Pacific Center-Entrance Car Used for Crosstown Service

Pantograph Equipped with Roller-Bearing Roller, Southern Pacific Standard Electric Motor Car

Motor Coach for Southern Pacific Electric Trains

Truck for Southern Pacific Motor Cars

tenance has been the occasional renewal of the composition flooring, especially in the aisles. The Flexolith renewals are made readily by troweling the mixture of cement and special liquid and allowing about thirty hours for the covering to set. The first renewals were not made until after three and a half years' service. There is nothing to show that any members of the framing have been pulled out of line, demonstrating that this pioneer lightweight type for heavy, high-speed service was correctly designed. All but the last fourteen cars, which are of Pullman make, were built by the American Car & Foundry Company, St. Charles, Mo.

TRUCK AND ELECTRIC MAINTENANCE

The trucks, which are of Baldwin manufacture, have required very little attention to date. Our principal work in under-car mechanical equipment has been confined chiefly to inserting case-hardened steel bushings in the pinholes of the brake rigging and the occasional renewal of Symington journal boxes.

The four motors per car are of GE-207-A 145-hp. rating, operated permanently two in series on 1200 volts with Sprague Type A-1 control. About 85 per cent of the trains comprise one motor car and one trailer.

For three years we never brought an armature into the shop except for the replacement now and then of string bands. More recently armatures are coming into the shop for the reslotting and possible turning down of commutators, but this we regard as the result of normal wear. Le Carbone brushes operated at 4-lb. to 5-lb. tension are standard. Some of these brushes have been in use for three years without renewal, which means that they ran for at least 180,000 miles. Furthermore, the commutators look as bright as the day they entered service.

Control renewals have been rare, the only work in that respect being the renewal of contactor tips and interlock posts. Circuit-breaker and reverser defects are virtually nil.

IMPROVEMENTS IN PANTOGRAPHS

When we began operation our current collectors were pantographs of the United States 121 type, equipped with a roller of 5-in. diameter, 24-in. length, and graphite bushing bearings. The original rollers were made of brass, but as they wore out after only 8000 miles aluminum was tried as the first substitute. This metal proved even less satisfactory than brass and was quickly discarded in favor of iron pipe. The second substitute was an iron pipe roller which gave a life of approximately 12,000 miles.

Before making any further change in rollers we set about to determine whether the life of the roller could not be lengthened by a change from graphite

bushings to roller bearings. The initial set was tried with some trepidation in view of the opinions of many engineers that an anti-friction bearing would suffer so much from pitting and sparking due to the passage of current, that it would soon be destroyed even if it did conduct sufficient current. Our experience with the trial bearings did not bear out these pessimistic contentions. We soon found that the combination of the iron roller and the roller bearing would give a much longer life, and consequently the change to roller bearings was authorized before the pioneer pair had worn out. The latter was installed July 26, 1913, and was removed in May of this year after a service of 118,707 miles. During this time it wore out six contact rollers. This roller bearing for pantograph operation has since been patented by the writer.

Although the iron pipe roller was giving good life, it did require a good deal of machining to prevent scoring of the trolley wire and for the installation of a suitable cage to carry the end castings in which the rollers are held. About July, 1914, we adopted a roller made of cold-drawn steel tubing. This requires no machining whatever, and as a current collector it is good for at least 18,000 miles with a possible maximum of 24,000 miles. On the lighter center-entrance crosstown cars, the same outfits had made 40,000 miles by July 1, without renewal.

The financial value of these improvements may be expressed by the following figures:

Old Rollers with Graphite Bushing Bearings	
Average mileage of 72-ft. cars, miles.....	12,406
Maintenance labor per month.....	\$580.75
Maintenance material per month.....	97.60
Lubrication (Welsh oil) per month.....	13.00
Total	\$691.35
224 new steel rollers made in 1913, at \$5.47 each...	\$1,225.28
Roller-bearing Rollers	
Average mileage of rollers on 72-ft. cars, miles....	18,000
Maintenance labor per month.....	\$77.35
Maintenance material	34.00
Lubrication (graphite and vaseline) per month....	3.62
Total	\$114.97

Thus the monthly saving for ninety-one cars alone is \$500 or more.

It will be noticed on comparing the lubrication item that we not only cut down its cost but were enabled to change the materials from Welsh oil and waste to a mixture of graphite and vaseline. This change has proved a boon to the car roofs and windows, which are no longer spattered and stained with oil, nor need trainmen and passengers worry about oil stains due to the current collectors. The car cleaning has been made easier, and complaints about splashing oil have been eliminated. It may be added that it was formerly necessary to lubricate the pantograph rollers twice a day; now one lubrication every regular inspection period of 1200 to 1500 miles suffices.

Catenary Bridge Suspension, Alameda Mole

Operation of a 1200-Volt Direct-Current Distribution System

Substation Operation at 1200 Volts, Direct Current, Has Proved an Unqualified Success, Even at Temporary Overloads of 125 Per Cent

By J. JOHANSEN

Chief Operator Southern Pacific Electric Lines

THE Southern Pacific electric lines which serve the towns of Alameda, Berkeley and Oakland were among the first 1200-volt d.c. systems in this country, operation having begun early in 1911. The high-tension end of the system is 13,200 volts, twenty-five cycles, three phase, and the low-tension end of the rotary converters is 440 volts with 630 volts at the d.c. end. Our adoption of 13,200 volts as the transmission potential was an advance of some 2200 volts over previous practice, but of far more importance was the use of 1200 volts for the contact wires.

SUBSTATION EQUIPMENT

In all we have three substations—Fruitvale, West Oakland and Berkeley. These contain respectively three, four and three pairs of 1500-kw. General Electric rotary converters, each pair made up of 630-volt d.c. machines permanently in series. Un-

der ordinary operating conditions six rotaries, two at each station, are used during the morning and evening peaks which run up to 7000 kw. on an hourly-load basis. The momentary swings are very severe, ranging from 2000 kw. to 11,000 kw., as shown by the station-load curves. These swings affect particularly the Fruitvale and West Oakland stations, which are nearest the pier terminals. The rotaries in these stations consequently get overloads of 100 per cent to 125 per cent momentarily. Despite this we have not yet suffered a single breakdown or flashover from these machines. In fact, the rotaries in all stations show practically no signs of wear or deterioration.

After 10 p. m. the load drops to approximately 4500 kw. at the power plant buses, and upon this Fruitvale is cut out. At midnight the load drops to about 3000 kw., whereupon Berkeley is cut out, leaving West Oakland, in the center of the system,

to carry the entire load up to 5 a. m. With West Oakland so used, one station feeds as far out as Thousand Oaks, 10 miles distant. Under these conditions the drop in the line has not been found to exceed 100 volts at any time, the average being 50 volts. During the day the drop is too small to be considered.

PROVISIONS AGAINST SERVICE INTERRUPTIONS

Interruptions in service have been very few, and even these have been due to causes outside of the stations, such as breaks in strain insulators. In four years' operation, we have not had a power detention in excess of fifteen minutes as the result of trolley or substation troubles.

Should a heavy short occur near any one of the substations, the interruption would be only momentary as the length of cable between stations affords enough resistance to keep one or two stations feeding into the line.

When a breaker opens up on a short-circuit, the operator closes the breaker immediately three successive times. If the trouble is still on the line he will report to the chief operator, who then sends

out the emergency crew to the section affected. However, the chief operator will ask that the triple closing test be repeated several times because line-men are supposed at all times to work with the 1200-volt lines alive. In other words, we do not wait for the report of the emergency crew before continuing operation.

MAINTENANCE CREWS

Our outside maintenance force comprises three gangs, each equipped with an auto-truck, as described by Jesse B. Nichols elsewhere in this issue. The substation personnel comprises the following: Fruitvale and West Oakland each have from 8 a. m. to 4 p. m. an operator, an assistant operator and a machine tender; each of the other two watches, 4 p. m. to 12 midnight, and midnight to 8 a. m., are taken by an operator and assistant operator. This makes a total of seven men per station. At Berkeley, one operator is on duty during the first watch from 8 a. m. to 4 p. m., another operator covers the second watch from 4 p. m. to 12 midnight, and the third watch is taken care of by an assistant operator, making three men in all.

Center-Pole Catenary Suspension

Transmission Line, Oakland Electrification

Combination Passenger and Baggage Car

Maintenance of 1500-Volt D.C. Cars by the Southern Pacific Company

Early Difficulties with Dynamotor Flashing, Brush Breakage and Pantograph Collectors Have Been Eliminated—Excellent Detention Records Now the Rule

By E. SEARS

Superintendent of Electrical Equipment Southern Pacific Company, Portland Division

ALL cars operated on the Portland division of the Southern Pacific Company are steel, the interior being trimmed with mahogany and the seats upholstered in green plush. These cars were built by the Pullman Company with the exception of three mail cars, which were built by The J. G. Brill Company.

The equipment consists of seventeen single-end combination baggage and passenger motor coaches, with smoking compartment, total seating capacity fifty-two; thirteen double-end passenger motor coaches with smoking compartment, total seating capacity sixty; eleven double-end control coaches, seating capacity sixty; five motor baggage and express cars, three motor baggage, express and mail cars, the mail compartment being a standard 21-ft. mail compartment. The length of cars over the buffers is 56 ft. 10 in., width of cars over the sills, 9 ft. 2 in.; wheelbase for car 42 ft., approximate weight of car, 51 tons, except control coaches, which weigh 32 tons each.

The electrical equipment for these cars was furnished by the General Electric Company, and the air-brake equipment by the Westinghouse Air Brake Company.

The equipment is arranged to operate on 600 volts and 1500 volts. The 600-volt operation at present consists of operation within the limits of Portland, the change from 600 volts to 1500 volts being accomplished automatically by electric-pneumatic operation. There is a 35-ft. grounded dead section between the 600-volt and 1500-volt sections. The head car is thrown by air while passing over the dead section. The air is operated from a valve switch in the motorman's cab, which also has electric contacts, so that, with the exception of the head car, which is thrown directly by air, the remaining cars are thrown electro-pneumatically, the valve switch being held in its proper relative position.

It is necessary to throw the controller off on the head car while changing it over. After this car has passed over the dead section, the controller can be replaced in the "on" position and each car can be operated on its relative voltage until it comes to the dead section, where it automatically changes over to the required voltage.

The potential relay drops out when on the dead section. It is so interlocked that the interlocks close the circuits necessary for operating the com-

View Underneath Motor Car, Air-Brake End, Showing Dynamotor and Universal Bracket in Foreground

View Underneath Motor Car, Electrical End, Showing Circuit Breaker in Right Foreground

mutating switches, for the 600-volt and 1500-volt positions. The commutating switch is operated by small air cylinders that are fed by the opening and closing of magnet valves, which are operated by the above-mentioned circuits. The commutating switch changes all dynamotor connections, as well as all motor connections, for the 600-volt and 1500-volt positions. The dynamotor furnishes lights and control on 1500 volts, but drives the air compressor on 600 volts. Lights and control on the 600-volt section are taken directly from the trolley.

The dynamotors gave considerable trouble due to flashing when first put in operation. The four shunt fields had been connected in series with a 400-ohm resistor; after they were connected in parallel, each with a 1000-ohm resistor, all trouble due to flashing was eliminated.

RELAYS

The control features, on account of 600-1500-volt operation, are somewhat complex because of additional relays.

A protective relay is used to protect the 600-volt wiring from 1500 volts, in case the car does not change over in going from 600-volt to 1500-volt sections; it also protects the dynamotor from receiving 1500 volts in the 600-volt position.

The current limit relay is the same relay as used on all General Electric 600-volt equipment.

The potential relay used is in at all times when the pantograph is on the energized trolley. It carries three interlocks, one for the control wire, one for the 1500-volt and one for the 600-volt position of the commutating switch. When on a dead section, the potential relay drops out, closing the circuit for operating the commutating switch.

The time-limit relay opens No. 4 wire and drops out on line contactors at section breaks. This does away with heavy flashes at these points. This relay is operated by means of an auxiliary contact rod on the pantograph, which is insulated from the pantograph frame. A brush or tickler is set a few feet ahead of the dead section. On coming in contact with the auxiliary rod on the pantograph the brush energizes the time-limit relay, causing it to open No. 4 wire.

A by-pass relay is used where grades prevent the current limit relay from picking up, thus keeping motors on resistance. This relay makes it possible to by-pass the current limit relay and not remain too long on any resistance point.

OTHER CONTROL FEATURES

The circuit breakers on this equipment are so arranged that they have a calibration for 600-volt and 1500-volt operation. The extra calibration for 600 volts is accomplished by a magnet which is energized by means of a contact on the commutat-

ing switch in the 600-volt position. Further, a calibrating spring is used for 1500-volt operation so that when the commutating switch is thrown to the 1500-volt position, the magnet coil is de-energized on the circuit breaker, leaving only the calibrating spring.

Another feature on this equipment is an automatic control cut-out switch, which opens the control wiring until the brake handle has been placed on the brake valve and the proper train-line pressure built up, so that the car cannot be started until after the brakes are properly charged.

The control features on this equipment have given us very little trouble. Each car is equipped with four GE 205-B motors, which have shown no defects, except for a few cases of armature coil trouble due to defective coils. We have had only one hot armature bearing since the beginning of operation, in January, 1914, and we have had no trouble from flash-overs.

The brush wear on the equipment is nominal. Some trouble was experienced when inaugurating operation, by the breakage of motor brushes, but this was corrected by getting suitable brushes.

On the whole we have not noticed that there is any particular difference between 600-volt and 1500-volt operation, as far as peculiarity of equipment is concerned. The only complexity is that in situations like ours it is necessary to have equipment that will operate on 600 volts and 1500 volts, a fact which causes numerous extra connections and pieces of apparatus.

CURRENT COLLECTION

A roller pantograph, U. S., Type 122, is used to collect current. Pantographs of all cars in a train can be operated electro-pneumatically by the motor-man from the front car. It was found necessary to develop a different type of lubrication for the collector than that originally furnished. We now use a circulating oil system, which employs a hollow shaft with a deflector. The shaft is stationary and as the roller rotates about it the oil is collected from the inner outer edge of the collector shell by the deflector and conducted to the shaft, which in turn carries it to the roller bearings. This type of oiling was necessary due to the high speeds attained by our trains. The cost of lubricating these collectors is about 10 cents per 1000 miles. The cost of maintenance has been 64 cents per 1000 miles, much of the latter cost being due to broken shafts, resulting from broken collector frames (which the factory is now strengthening); also to the fact that our first collectors were made of iron pipe, which opened up in the seams. We are now using 5-in. steel tubing, from which we expect to get an average of at least 50,000 miles and possibly more, although it has not been in service long enough for

us to determine this fully. The oil in the roller is replenished at every third inspection, or after every 6000 miles.

The only thing unusual about the air-brake system is the universal valve. This has given no trouble to date, and we have had no detentions due to air-brake equipment. All air-brake parts are inspected on a 2000-mile basis. At the shop we have a Westinghouse test rack, on which all parts are tested before being put into service.

Painting was begun on cars in November, 1914, at the end of eighteen months' service. Our cars have now been out more than two years, and before all cars are painted some of them will have been out thirty months or more. The cars are cleaned at each inspection, or at the end of 2000 miles, using an oil cleaner only if necessary. Between inspection cars are dry wiped. If it is raining, a scrubbing brush and water are used to rinse off the body. Windows are cleaned with Bon Ami.

We have not given our cars a general overhaul-

ing. In fact, we do not intend to give them what can be termed a general overhauling, as the cars will be painted when it is found necessary, and motor repairs will be made when a gage shows that the bearings are worn sufficiently to be removed. Other parts on all of our equipment are handled in a similar manner.

Maintenance of 1200-Volt D.C. Cars by the Oregon Electric Railway

A Unique Feature Is the Successful Inter-Operation of Old 600-Volt and New 1200-Volt Motors in the Same Quadruple Sets

By D. I. CLOUGH

Master Mechanic Oregon Electric Railway

THE 1200-volt lines of the Oregon Electric Railway comprise 122 miles of single track over which a total of ninety passenger motor cars and ten locomotives are operated. In the city of Portland we operate at 600 volts, but elsewhere 1200 volts are used. The original line ending at Salem, 50.8 miles distant, had been operated at 600 volts, but when the line was extended in 1912 to Eugene, 122.4 miles from Portland, the change to 1200-volt operation was made.

The twenty-four original cars were changed only by the addition of 1200-volt type-M control and two GE-205 motors, two out of four 600-volt GE-73 motors being retained for 1200-volt operation by permanent series connection on the low side. These older motors are not changed in any way. The new cars carry four GE-205 motors and the same control and dynamotors already named. The locomotives are of General Electric type, four 50-ton locomotives carrying four GE-207 motors and six 60-ton locomotives carrying four GE-212 motors. The locomotives are used for freight only.

Cars are inspected every 1800 miles and loco-

tives every 1000 miles. Overhauling on both classes is made every 100,000 miles. Inspection is carried out at the Hoyt Street carhouse, but all overhauling and heavy repair work is done at the Porter Street shops, both at Portland. We also have a running inspection of journals and trolley wheels made by inspectors stationed at Salem and Eugene.

For current collection we employ a Holland-type trolley wheel with U. S. 13 base and Knutson retrievers. But one pole is in use at a time. The estimated life of these wheels is from 6000 to 8000 miles. Cup grease lubrication is used. The tension of the base springs is maintained at 30 lb. The maximum current passed by this wheel in regular service during the acceleration of a two-car train is 450 amp.

Despite the unusual combination of 600-volt and 1200-volt equipments the motors have given excellent service. Not more than two flash-overs occurred within the past year and these were caused by broken brushes. The latter, which are chiefly of General Electric grade-B type, are maintained at about 6.5-lb. tension, and aside from the two

breakages noted they have caused no other troubles. The only other motor defects have been the rewinding of two or three armatures of the older motors due to breakdown of insulation. Even here replacements have been made with factory-wound coils.

When the change to 1200-volt operation was made, we slotted the GE-73 motors 1/32 in. so that the same grade of brushes could be applied and also that other advantages of slotting might be obtained. Commutators have given us practically no trouble.

We attribute the good behavior of the motors to four causes: inherently good design, correct construction, frequent inspection and to reasonable operating conditions, as we do not attempt to make up trains with less than 50 per cent live equipment.

The control, which embodies automatic acceleration, has also made a creditable record.

Our delay statements tell the story of equipment reliability better than anything else. Some typical figures covering delays ascribed to mechanical trouble are shown in Table I.

TABLE I—OREGON ELECTRIC RAILWAY DELAY RECORD AND CAUSES

	Miles Operated	Loss in Minutes			
		Mech.	Elec.	Air	Man.
June, 1914	251,386	28	25	0	0
July, 1914	235,477	0	0	120	0
August, 1914	247,567	15	5	35	0
September, 1914	254,172	0	30	0	0
October, 1914	242,221	0	5	20	0
November, 1914	212,816	0	20	0	0
December, 1914	218,513	30	0	20	0
January, 1915	219,635	40	0	0	0
February, 1915	195,029	19	20	0	0
March, 1915	208,821	0	0	0	0
April, 1915	197,901	0	0	0	0
May, 1915	206,774	50	0	0	0

Our lubrication cost for all equipment, exclusive of trolley wheels, has proved so low that some operators may even question the figures. For example,

our costs per 1000 car-miles were as follows in the months named: June, 1914, \$0.082; July, 1914, \$0.92; August, 1914, \$0.098; September, 1914, \$0.1198; October, 1914, \$0.141; November, 1914, \$0.1046; December, 1914, \$0.0449; January, 1915, \$0.0685; February, 1915, \$0.0595; March, 1915, \$0.0601; April, 1915, \$0.0621, and May, 1915, \$0.0628. This lubrication is under the usual Galena guarantee.

These low figures are due to the economic reclamation of oil from used waste and the efficient oiling of the equipments.

The brakeshoes, which are of Love flanged type, also are showing very low costs, as illustrated by the figures in Table II.

TABLE II—BRAKESHOE RECORD—OREGON ELECTRIC RAILWAY

	Per Cent Wear	Miles Per Shoe	Cost Per 1000-Car- Miles

Signal Maintenance on the 1200-Volt Oregon Electric Railway

*One-Fourth the Time of One Man Is Found Sufficient
to Maintain 8.2 Miles of Block Signals on Double Track*

By E. R. CUNNINGHAM

Electrical Superintendent Oregon Electric Railway

THE Oregon Electric Railway operates out of Portland approximately 200 miles of single track, of which the first 8.2 miles from Portland were double-tracked in 1913. This section was a part of the original 600-volt line built in 1907, and the second track was added and a number of curves were eliminated better to handle the increased business.

The cost of the double-tracking between the Jefferson Street station and the junction at Garden Homes, about 7 miles, of straightening tracks, reducing grades and eliminating curvature was about \$750,000. In this work the street grade was abandoned in the approach to the station at Jefferson Street, and the tracks were placed part of the way on trestle work over private right-of-way. Increase of trains and traffic necessitated these improvements.

The principal work and the expensive portion was between Multnomah station and Garden Home. One big cut and two fills, one of which was about 95 ft. deep at the highest point in the ravine, were necessary to complete the cut-off. This improvement eliminated a reverse curve and a high

trestle and altogether shortened the main line by about 1300 ft. The fills aggregate 2000 ft.

On this double-track section we operate trains on a minimum headway of five minutes; on the single-track sections beyond the Garden Homes terminus of the double-track sections the minimum headway is twenty minutes. Therefore we are operating what is practically a suburban service to Garden Homes and an interurban service beyond that point. All cars, however, are geared for the same speeds.

This service is protected with the General Railway Signal Company's three-position, left-hand upper-quadrant a.c. track-circuit signals installed in 1912. In connection with the double-tracking we changed relays for double-track operation and relocated posts where necessary. This was done without interruption to service.

The line is divided into blocks varying in length from 1.4 miles to $\frac{1}{2}$ mile, according to curvature and other conditions. Only one signal maintainer is required. His duties also include the care of about twenty Hoeschen crossing bells, two interlocking plants, track bonding, and tunnel signals on the United Railways division of this company.

Substation and Agent's Office Combined,
Oregon Electric Railway

Concrete Substation at Orrville,
Oregon Electric Railway

In fact, the maintenance of the block signals alone calls only for about 25 per cent of his time.

To facilitate quick movement over the line, the signal maintainer is provided with a Fairbanks-Morse gasoline car. Conditions as to repairs and replacements are reported to the electrical superintendent.

The most serious trouble has been the squeezing out of the insulation between rail ends because of extraordinary rail expansion during unusually warm weather. We have tried to correct this trouble by replacing the single piece of horn fiber with a set of alternate laminations of fiber and steel, but with no particular success.

The only change made in the signal mechanism is an improvement in the bearings of the Model 2-A signal-operating motor. This change was initiated

by the General Railway Signal Company to forestall possible trouble from worn bearings.

The performance of the signals is indicated by the following record for the months of this year covering respectively the number of signal movements and the failures which are due to the signal mechanism:

STATEMENT OF SIGNAL MOVEMENTS FOR YEAR ENDED JUNE 30, 1915					
Signal Number	Total Movements	Failures	Signal Number	Total Movements	Failures
1.5	39,395	5	5.6	20,491	0
1.8	19,251	4	6.1	23,189	1
2.1	21,857	6	6.4	20,209	1
2.2	28,352	7	7.1	22,358	2

How a Railway Helps the Farmer to Produce Bigger and Better Crops

In Conjunction with the Oregon Agricultural College the Southern Pacific Company Teaches the Farmers, on Both the Steam and Electric Lines, to Make the Most of Their Opportunities

By H. A. HINSHAW

General Freight Agent Southern Pacific Company

AS early as 1908 the Southern Pacific Company instituted a farming demonstration train in conjunction with the extension service of the Oregon Agricultural College. The subjects covered by these trains are horticulture, dairying, hog raising and poultry husbandry; and the exhibits include specimens of dairy cows and hogs to prove the points made by the demonstrators.

The railroad company furnishes the rolling stock and operates the trains on a rigid schedule, advance notice of which is sent direct to every farmer in the affected territory, to all newspapers, commercial bodies and the station agents. The merchants in the towns along the line are always particularly helpful in urging the farmers to attend.

The college, which is a State institution, furnishes all livestock and other demonstration material. It also supplies the faculty of agricultural and other professors who deliver lectures on their specialties, from silos to eggs. From the first the work attracted much interest among the farmers, and this interest has continued to this day.

While this work of the Southern Pacific Company extends over a zone of more than 1000 miles, it may be of interest to tell more in detail of what has been done in the territory immediately to the southwest of Portland. In this section, locally known as the "Loop," about 100 miles of route had been electrified in 1913 for 1500-volt d.c. passenger service in the name of the Portland, Eugene & Eastern Railway, now absorbed. This electrification introduced new conditions inasmuch as the more frequent service brought the farming com-

An Interested Audience of All Ages at Forest Grove

munities closer to large masses of consumers. Thus a change in the character of products arose although the products themselves were still moved largely by steam trains.

Originally the loop territory was devoted almost entirely to grain. With the coming of the demonstration trains the farmers learned that dairying, hog raising and fruit would find a more profitable market. The electrification has made the latest change, for owing to the increase in the population of commuting towns, truck gardening has been inaugurated on a large scale.

In all of these developments the farmers have been guided largely by the demonstration service. They have been shown not only what classes of products were most desirable but what particular varieties of animals or plants were best adapted for this territory and the different soils thereof.

One result of this education is reflected in the fact that the highest prizes for milk at the Panama-Pacific International Exposition were awarded to the dairy interests of Portland and vicinity.

On the whole this work has proved gratifying not only in increasing the value of freight shipments, but in securing the good-will of the farmers and the country newspapers. The movement has made such headway that one demonstration train, run in February, 1914, was visited by 7000 people in one day and 36,000 people within two weeks. The interest shown by the children is so great that a "Children's Special" is a possibility of the future. In fact, the "college on wheels" should prove a potent factor in keeping the younger generation on the farm.

Effect of Publicity on the Jitney Movement in Portland

The Portland Company Finds that a Straightforward Statement of the Facts to the Public Is Helpful—A Weekly Pamphlet Distributed on the Cars Is One of the Best Mediums of Such Instruction

By F. W. HILD

General Manager Portland Railway, Light & Power Company, Portland

PORTLAND saw its first jitney in January of this year, although 10-cent auto-buses, in competition with our suburban trains to Vancouver Ferry, had already come into being a month or two earlier. With the arrival of the jitney, the 10-cent auto-bus went out of business because it lacked speed and frequent service and embodied an attempt to use in passenger equipment apparatus designed to handle freight. Evidently the rate of fare was not the real objection because the jitney buses also charge a 10-cent fare on the 7.5-mile line to Vancouver Ferry.

PUBLICITY MEDIUMS

Our first publicity concerning the jitney took the form of addresses by President Griffith and other officers of the company before the Chamber of Commerce and other public bodies. As the jitney's novelty then made it a matter of live news, accounts of the addresses received good space in the newspapers.

On Feb. 4 the employees of the Portland Railway, Light & Power Company, as represented by several organizations, including the Brotherhood of Electric Trainmen, circulated a petition addressed to the City Council. This petition, signed by 27,500 people of Portland, requested the City Commissioners to pass an ordinance requiring the jitneys to operate only under franchise. This petition did not lead to the desired result, as the commissioners believed that the public was not yet in the proper frame of mind to help a public service corporation constructively.

PAMPHLETS EFFECTIVE

During the period that the petition was in circulation we put out a pamphlet on the jitney bus addressed to all employees, but with the suggestion that it be passed on to others. This pamphlet discussed the jitney in its various phases, particularly in its relation to the electric railway and its employees. This was followed by a pamphlet showing how much money the company paid to the municipality, both directly in taxes and bridge tolls and through the less obvious forms of paying charges and free transportation for city employees. This second pamphlet was widely distributed, and, from

the voluntary comments received, it must have made a decided impression upon the thinking members of the community.

This pamphlet was supplemented and followed by display advertisements in the daily press. Each advertisement took up a definite aspect of the taxation problem, amplifying it enough to bring out all the pertinent points and yet not detailed enough as to prevent understanding the statement in one reading.

However, the most striking announcement proved to be a full-page display in the "house warming" issue of the *Evening Telegram*. This advertisement was entitled "Why Such Irresponsibility?" and told its own story in the form of a sheaf of clippings reproduced from daily newspapers. These clippings were grouped to show the menace of the jitney from the four standpoints of moral danger, thuggery, accident risk and service irresponsibility. This advertisement was not only reproduced in the *ELECTRIC RAILWAY JOURNAL* of March 27, 1915, but also attracted the attention of prominent magazines in other fields, such as the *Sunset*, the leading monthly of the Pacific Coast, and of *Printers' Ink*, the great advertising journal. Mats of this announcement were also sent to electric railways as far south as Texas, as far north as Canada and as far east as Maine.

INTRODUCTION OF A HOUSE ORGAN

The fact that the public was showing a genuine interest in our statements accelerated the publication of a four-page weekly of pocket size which is now distributed in our cars to the number of 50,000 per issue. We purposely began its publication without a name, offering prizes amounting to \$30 for the best title. About 10,000 suggestions were received from a population of 240,000, this indicating in itself that the public was already reading the pamphlets. In the opinion of the four city newspaper editors who constituted the jury of award, the best title submitted was the punning one of "*Watts Watt*."

The value of such a weekly publication as *Watts Watt* lies in keeping the company's side of important problems continuously before the public, and of concentrating on any particular topic that

may happen to be in the foreground. The case of the jitney election is one in point.

The jitneyites had circulated a referendum petition but had so chosen the time of filing that the ordinance, as eventually passed by the Council on April 2, 1915, would have been held up for two years, namely until the municipal election of 1917, before the attitude of the electors could have been ascertained. However, under the Oregon law, legislative bodies may refer their own measures to the people for approval or rejection. This action was taken by the City Council in time for the election of June 7, 1915, at which time the voters indorsed, by a substantial majority, the principle of jitney regulation.

Two causes were potent in attaining this result: First, our publicity campaign, as outlined hereinbefore, supplemented by an aggressive display advertising propaganda in the public press for about one week prior to the election; second, the active interest and co-operation of the company's employees aroused by personal addresses made by President Griffith and the writer.

One lesson that the jitney experience has confirmed is the wisdom of going directly to the public with your side of the case. If a utility's publicity

appropriation will permit a house organ, I would by all means favor its publication as a way of greatly improving the relations between the company and the employees and also as of interest to the more prominent stockholders. However, within the limits of a publicity appropriation, I would give priority to a pamphlet for circulation among the public. This conclusion may be due to a study of the local conditions as I find them in Portland and of similar conditions in other Pacific Coast cities where a very sad confusion of economic ideas is reflected in the encouragement to competition of utilities and of occasional unintelligent, hostile legislation against corporations in general.

My study has led me to the conclusion that a pamphlet of this nature should not exceed four pages, and that the size should not be large, in order that the subject may be perused within the duration of a street car ride. It is my further belief that the public will more readily absorb and digest the rather dry and heavy matter which must necessarily form a presentation of the facts relating to utility economies if such matter is accomplished by semi-humorous text. The principle, of course, is first to get the town good-natured to have it listen to you willingly.

Traffic Analysis and Schedule Planning at Portland, Ore.

*Schedules Are Compiled from Data Supplied by Conductors and Inspectors
—Standards of Car Service Have Been Established—The Assignment of
Miscellaneous Duties Has Simplified the Question of Earnings for Extras*

By FRED COOPER

Superintendent of Transportation Portland Railway, Light & Power Company

IN 1912 the Portland Railway, Light & Power Company inaugurated a system of traffic analysis and schedule planning in charge of a centralized schedule department. Previously, each division made up its own schedules, the principal guide being the experience of the local superintendent, modified by the pressure exerted by the public on the one hand and by the management on the other. We felt that this practice was too inexact to provide adequate service and to provide it economically.

The data upon which our schedules are built up are, first, the standards of service required by the public; second, the car-hours required to provide fairly satisfactory runs for the platform men; third, the standard of service laid down by the management.

To harmonize these three points of view it is essential to know exactly where the traffic originates and what volumes must be handled between different points.

I am aware that a number of Eastern companies employ special checkers and inspectors to make traffic counts. We do not have to go to this expense, however, partly because of the excellent

platform personnel but even more owing to the fact that the density of population is much lower in a given area than in cities like Boston, Pittsburgh and Newark. It is, therefore, practicable for us to rely upon special reports from conductors covering the number of passengers at selected peak points on each trip.

This peak-load slip, which constitutes our fundamental form, is reproduced herewith. The instructions on the form are self-explanatory. Special attention, however, may be directed to the fact that this record also covers delays and their causes. Information on delays is very important inasmuch as it shows whether the cause of unusual congestion is permanent or accidental. Continued congestion which causes delay necessarily calls for a careful study of conditions, rerouting or other possibilities of traffic relief.

The peak-load checks are supplemented by the regular inspectors who devote their chief attention to checking variations in car spacing. Since they also note the number of passengers, their figures are a check on those supplied by the conductors.

The information collected from the conductors'

Commencing with Train 5 leaving 11th & Yamhill Sts. at 4:59 p.m. to Train 5 leaving 11th & Yamhill at 6:17 p.m., inclusive, all trains and trippers will carry dash signs "No Stops West of 50th St."
Steam Road crossing East First and Morrison must be flagged by conductor when regular flagman is absent, 10:00 a.m. to 2:00 p.m. and 7:00 p.m. to 6:00 a.m. Reliefs made at 27th and East Morrison.

PHONES: Water & E. Morrison, Grand Ave. & Morrison, 39th & Belmont and 60th & Belmont.
SITTING DOWN LIMIT: East of Grand Ave. and South of Yamhill St.
TOILET FACILITIES: Rear of Real Estate Office, E. 88th & Yamhill Sts.

MT. TABOR SATURDAY SCHEDULE NO. 3
EFFECTIVE AUG. 1st, 1914.

Form of Schedule for Individual Lines

and inspectors' peak-load slips is converted into graphic form, a separate chart being made either for individual lines or for overlapping routes on which a certain combined headway is desired. In the latter case, as illustrated, different styles of dash and dotted lines are used to differentiate the routes.

The chart just referred to is made out on cross-section paper, on a scale of one cross-section to the minute horizontally and one cross-section to the passenger vertically. The seating capacity of different styles of cars is also shown by horizontal broken lines. Thus the schedule department can see at a glance whether the service is according to the standard set by the management. The traffic chart after preparation is sent to the division superintendents for comment, then to the schedule department for further comment, and finally to the superintendent of transportation for approval.

This standard briefly is: Seats for all passengers during the normal or off-peak hours, assuming no serious interruptions in schedules or unusual traffic conditions; sixty-seven seats for each 100 passengers at peak-load points during the morning rush hour; sixty-three seats for each 100 passengers at peak-load points during the evening rush hour.

To reconcile these standards with the requirements of the public and of the employees is the most important work of the schedule department. It is necessary, therefore, to make a detailed study of the traffic characteristics of each line and the habits of the riders. The peaks of some lines do not coincide with others, and again the crosstown main lines may be overloaded for the very short distances between transfer points. The frequency of the off-peak schedule is determined by the class of riders, for while we aim to give a seat to every passenger, it would be poor policy to space the cars with the expectation of getting a full seated load for each. Furthermore, in a well-to-do district frequent service which will insure freedom from crowding will discourage a lot of walking and increase shopping travel.

In taking care of the men we are fortunate in being able to supplement the earnings of the tripper men, especially, by assigning them to other duties during the off-peak period. This outside work includes the distribution of lighting bills, at a saving over mail, the cleaning of cars, the taking of Ohmer register readings, removal of transfers from transfer boxes, and other miscellaneous duties.

This plan of handling the tripper problem serves two important purposes: It is no longer necessary to run cars for no other end than to give a platform man a reasonable day's work, and we attract and retain in the service a higher grade of men. The result is reflected by the fact that 31.3 per cent of the men in the employ of this company at the present time receive the maximum rate of pay.

A schedule covering a given line is divided vertically to show the following data in order: Sets of double columns show the starting time from each terminal for the train number which is written horizontally above and across the time figures. These double columns of assigned regular and tripper trains are continued to the end of the day's schedules. Below these columns the assignment of runs is shown. This states clearly when the crews holding the runs listed are to report, the figures being five minutes in advance of the time they are to take out their first car of the

In the Business Heart of Portland

day. The relief time is also shown, together with the total working hours of each crew. Below the list of run numbers is miscellaneous information such as minimum running time between time points; peak-load points for the use of the conductor; location of private telephones for use in case of emergency; limits in which motormen are permitted to sit; location of toilet facilities (as arranged for by this company); location of all flagging crossings; period in which certain cars will operate as no-stop cars.

The reference to minimum running time is explained by the fact that a little more leeway is allowed during the congested periods than during the off-peak hours, when traffic conditions are such as to permit operation with the least possible delay.

Departmental Work Planning System at Portland

Self-Devised Modifications of the Taylor System Have Been Successfully Applied to Several Departments—Complete Records of All Work Instantly Available

By F. P. MAIZE

Master Mechanic Portland Railway, Light & Power Company

IN February, 1914, the Portland Railway, Light & Power Company, at the suggestion of our general manager, F. W. Hild, introduced a self-devised modification of the Taylor system in its car maintenance line, power and transportation departments. The company is also planning to inaugurate similar methods in the line and track department.

As master mechanic of this company, the writer was assigned the task of working out the general details of the system so far as car maintenance was concerned. After conference with the executive and clerical staffs, the first step was to examine a number of Taylor systems in manufacturing shops with a view to seeing how we could take advantage of their experiences. We then prepared the forms necessary to cover the change in the system of working.

Time Clerk Answering Telephone, Stamping Time Card and Putting It in Pigeonhole

Under the old system, the individual foremen had entire charge of the assignment of work. The only absolute check on the men was the time clock record of "in" and "out" type. The details of the jobs done were made out on a separate time card by the men themselves.

Under the present system all work is planned at the office of the master mechanic, the responsibility of the foreman being limited to general supervision of the work and to the instruction of new men.

The routing of a given car overhauling job is now as follows: When the car has made its mileage it is called in by the notification of the chief clerk to the foreman of the carhouse affected. Upon delivery of the car with the foreman's defect slip, the latter is turned in to the master mechanic's office as a notification of delivery. Next the chief clerk orders the car to be placed on a specified track.

 " 19 - Square Nose -

Schedule of Tools Referred to by Number

varnished to insure long life. Outside of those in general use, one set is kept by the routeing clerk and the master set is kept on file in the office of the master mechanic.

When the workman has completed the job assigned he calls up the time clerk again to give his time for the given shop order number. The clerk then stamps this finishing time on his own copy of the time card with a Calculagraph which prints the elapsed time directly in hours and tenths as reproduced.

Should a car damaged in an accident be sent in for repair, the record will begin with the report of the local carhouse foreman to the chief clerk. The latter will then order the delivery crew to place the car in the shop as in ordinary overhauls. Each foreman is then notified to inspect the car and make a report of the repairs necessary. Upon this combinations of regular cards are made out to cover the case. A similar procedure is in vogue for painting jobs.

In case the job to be handled is manufacture, the chief clerk will receive an order from the purchasing department for the parts wanted. For such jobs we also have regular instruction cards. If, for example, the order is for 100 cast-iron armature bearings, pattern 114, the workman will get a time card with the appropriate instruction card reference number. The first instruction is the adjustment of the machine, the latter being identified by its number. The steps of the work are then specified as follows:

- 1—Chuck bearing.
- 2—Set tool No. 30.
- 3—Turn off—Roughing cut (with speed and feed).
- 4—Turn off—Finishing cut (with speed and feed).
- 5—Adjust tool.
- 6—Face off end (with speed and feed).
- 7—Set tool No. 81.
- 8—Face off under collar (with speed and feed).
- 9—Set tool No. 44.
- 10—Bore to $3\frac{1}{4}$ in. (with speed and feed).
- 11—Set tool No. 19.
- 12—Turn end to $4\frac{3}{16}$ in. - $\frac{1}{4}$ in. long (with speed and feed).
- 13—File finish.
- 14—Take out and repeat operations 1 to 13.

Time Card with Calculagraph Record

Our methods as shown by the instruction cards are the results of stop-watch tests continued until the best way had been found. Therefore, the individual workman loses no time in determining what to do next.

To be fair to the men, the possibility of exceptions to the rules must be taken into consideration. Should a workman, for instance, find that a casting is too hard to be handled efficiently at the designated speeds and feeds, he is privileged to call the attention of the foreman to that fact. The foreman will then decide upon the proper speed and feed, notifying the chief clerk accordingly.

Since the ability of the men is gaged by the time they require for specific operations, it is desirable to provide workers on like jobs with exactly the same tools. Therefore, all grinding is done by one man in the toolroom and according to standard instructions.

Perhaps the largest saving in time is made by the system of routeing supplies. When the men begin a job they make a list of everything to be repaired and all material to be ordered. This list, after being checked off by the foreman, goes to the routeing clerk who calls for the necessary requisitions and makes out the routeing. Therefore, the men do not start to assemble a job until all the material is at hand. Comparison of time cards has also shown us what losses in time occur when the work is not properly laid out, such as putting too many men on one job and assigning men to jobs in which they are not at their best; or again, that the machine used is not suitable for the work.

In view of the fact that efficiency systems are often accompanied by a large increase in the clerical staff, it is interesting to point out that we had to add only one clerk, whereas the shop forces were reduced from 130 to 92 men for the same output. This result was due, in part, to the transfer of clerks from the individual departments to a central office and to the addition of a Calculagraph, but the principal cause was a detailed preliminary study which extended over five months.

Car Maintenance on a Definite Cost Basis

A Central Feature of the Maintenance Records Is the Practice of Showing All Labor and Material Costs for Each Car Overhauled

By K. C. SCHLUSS

Superintendent of Power and Equipment Puget Sound Electric Railway, Tacoma

THE primary purpose of car maintenance records is to secure knowledge of the behavior of equipment and the cost of upkeep, but such records are also of value in many other ways. They help to maintain the morale of the shop force by presenting a readily accessible record which acts as a check on the thoroughness of the work performed by each branch of the maintenance staff; they afford to the claim department information which may be worth thousands of dollars; they give many data of value in making appraisals, either by the company or commissions, because they show the cost of betterments and renewals, and they make it possible to forecast with reasonable accuracy the cost of maintenance and renewals for the ensuing fiscal year.

We do not treat a car as an entity, but as made up of separate units such as car body, trucks, painting, air, light and heat wiring, all electrical equipment except motors, motors and, finally, air equipment.

CAR INSPECTION AND OVERHAULING

City cars are inspected every 900 miles and inter-urban cars every 1200 miles. All inspection that is carried out at the Tacoma shops is done during the day time, the only night work being the setting-up and releasing of brakes and the correction of minor defects reported for immediate attention. Motormen on turning in their cars must also submit a statement on the carhouse register that their cars are either O. K. or defective. In the latter case, each defect must be specified. The practice of reporting O. K. acts as a check on the motorman should he make a false report in an accident case concerning the previous condition of the car. The car inspection reports are filed in calendar order for reference only as they have no connection with the maintenance records.

Cars are overhauled about every 80,000 to 100,000 miles or at approximately two-year intervals. If in overhauling a car we find that certain parts

are not due for overhauling, because of transfers from one car body to another, we simply give these parts a casual inspection. Since individual records are kept, however, it is feasible to bring the car in later for the purpose of replacing such parts only.

To identify such parts in our records, every truck, as well as air compressors, wheels, gears, pinions, etc., receives a number. Individual record cards for the parts named are kept to show the numbers of the successive cars on which the part has been used, the dates "in" and "out," the reason for removal and the character of repair.

SYSTEM OF WORK ORDER NUMBERS

Independent of these equipment card records, all body work, painting, air, light and heat wiring, trucks, electrical equipment except motors, motors, and air equipment are handled under a general master work order number which covers all car overhauling for the year. Each job is differentiated, however, by the addition of the car number. A placard bearing both numbers is posted on the car and orders are issued to all the foremen concerned. The overhauling work charged against the car as such does not include traction armatures,

		Total Cost \$ 112.05						

Detail of Painting Material and Labor, Constituting One of a Set of Cost Record Cards (Front and Back)

wheels, axles, air compressors and controllers. Should the cost records be used for appraisals or maintenance estimates, the excluded items enumerated would be cared for by taking their average value for any class as a whole.

It will be seen, therefore, that we do not saddle on the car the cost of maintaining equipment which is changed and overhauled at frequent intervals. For example, if a gear is replaced on account of wear we would not charge it against the overhauling cost of the car, but if the gear ratio is changed we would do so. All of the work done which is done in the shop for the mechanical department and outside departments of the company, except running repairs, is charged to standard or special work orders.

COST OF CAR OVERHAULING

The data covering the cost of a car overhauling are compiled from time and material slips turned in by the workmen, who state the nature of the work done, the work order number, and the car number.

The prices of material received by the workman for a given car are extended on the storeroom requisitions by the storekeeper and turned over to the cost clerk for entry on cost cards. The cost card for overhauling any car, when completed, shows the cost of all material and labor. It also bears a summary of the work performed. At present we file these cost cards consecutively by car number.

It will be understood, of course, that the records mentioned above bear no relation to the standard classification of accounts, although the postings

Work Order 906 Car No. 519 Light Overhauling

	Material	Labor	Total
A—Body.....	\$91 11	\$126.86	\$217.97
B—Painting.....	26.17	85.78	111.95
C—Trucks.....	10.87	31.36	42.23
D—Air, light and heat wiring.....	9.40	11.35	20.75
E—Electric equipment.....	2.94	12.90	15.84
F—Air equipment.....	.42	2.89	3.31
Total.....	\$140.91	\$271.14	\$412.05

Complete May 14, 1915.

A—Body had light overhauling. Following new material used: four steps complete, twelve metal step plates, two side vestibule doors, all vestibule window stops, roof canvas on upper deck, twenty-four pieces siding, eight iron grab handles, water drip over end doors, 12-ft. apron, flooring in toilet, four hooks on vestibule door. Following repairs: lowered sign rack, removed end toilet window and filled space with siding and panel inside, straightened No. 1 iron bumper, installed Ohmer register.

B—Car repainted.

C—Trucks not overhauled. Light repairs to brake rigging, new bolster No. 2 truck.

D—Inspected all wiring and moved light switch. Installed new receptacles.

E—New third-rail beam.

F—Air equipment inspected.

Summary of Work Done on a Car During Light Overhauling

for each account are taken from the same labor and material slips.

To my mind this practice of showing exactly what is done on a car during an overhaul is the only fair way for making comparisons with the overhauling costs of other railways. If a superintendent of equipment is not obliged to show the work in detail it is very easy for him to make a record for economy that will prove very costly for the company in the end. Aside from this feature, such detail of cost keeping permits forecasting the cost of overhauling from year to year, and has other advantages which are mentioned earlier in this article.

WASHINGTON AUTO BUS COMPANY

JUNE 10, 1915

Schedule Card of Auburn-Enumclaw Bus Line Showing Connections
with Seattle-Tacoma Interurban Railway

THE Washington Auto Bus Company, a subsidiary of the Puget Sound Traction, Light & Power Company, has recently begun the operation of auto-buses as feeders of the interurbans operated by some of the railway subsidiaries of the Puget Sound Company. At this time we are operating three lines of buses as follows:

Between Auburn and Enumclaw, 22 miles, running at right angles to the Seattle-Tacoma Interurban Railway, making connections at Auburn. Three twelve-passenger Studebaker cars are used to give the service which is laid out to make connections with the interurban trains. Two-part coupon tickets are sold to cover combination interurban and auto-bus trips, each ticket showing the name of the issuing company. The bus fares are invariably figured at 3 cents per mile, whereas the interurban straight railway fare is sometimes as low as 2 cents per mile, and commutation rates are even less.

Between Edmonds and Seattle Heights, 3 miles,

feeding the Seattle-Everett line of the Pacific Northwest Traction Company, making connection at Seattle Heights, two eleven-passenger Studebaker cars are operated. Tickets and rates of fare are on the same plan as the Auburn-Enumclaw line.

Of course, all of the vehicles enumerated are for one-man operation. The chauffeur acts as ticket seller as well as collector. International neck registers are used for the collection of cash fares.

In addition to the foregoing two lines, we have several other routes in prospect, but will do nothing with them until further experience is gained.

We look upon the auto-bus as the only practicable means for developing communities adjacent to but not served by the interurban railways. Such service is the direct result of improvement in automobiles and highways. We feel, too, that it is not only proper to give the public all possible transportation service, but also to do it before the revenues of existing lines are jeopardized by the competition of independent auto-buses.

The Auto-Buses of the Washington Auto-Bus Company Feeding the Electric Railway Are Handled by One Man

Auto-Buses as Feeders of the Puget Sound Traction, Light & Power Company

The One-Man Car as an Effective Means of Reducing Headway

The Author Suggests the Possibility of Interpolating Short-Line, Short-Headway, One-Man Cars on Through Routes

By G. A. RICHARDSON

Superintendent of Railway Puget Sound Traction, Light & Power Company, Seattle Division

THE one-man car is not a new proposition in itself, for first we had the bob-tail car of horse days, and in very recent years electric cars have been designed specially for such operation. The general idea has been that the one-man car was particularly suitable for small towns where the difference between one and two men on a car is the difference between profit and loss. However, it is the writer's belief that there is also a field for the one-man car in cities of medium size not only for shuttle, crosstown and feeder service but for short-line or turn-back cars on trunk lines. For example, if eight cars are operated on a line on a seven and a half minute headway over the entire length of a route which takes sixty minutes for the round trip, two of these through cars might be taken off, leaving six cars for the through service and releasing four trainmen for one-man car short-line service operation. The result would be six-car ten-minute headway over the entire route, with four-car ten-minute headway over the business section of the route, giving a combined headway of five minutes against seven and a half minutes with the present form of operation, with no additional cost in platform expense. A frequent short-line service is the most effective way to meet the jitney.

Second Avenue, Seattle

This proposition is doubtless a radical one, but radical diseases call for radical remedies. Hitherto electric railway operating men have been obliged to look very closely at the item of platform cost because two-men operation often made the cost of a short headway prohibitive.

The operation of jitneys has shown that many people are likely to take the first transportation means offered because they want short-headway operation. It has also been shown in the case of the larger or bus units that the traveling public has no intrinsic objection to public vehicles being operated by one man.

A transition period, during which we must modify some of our former standards, is now upon us, and if the jitney accelerates the use of the one-man car its coming will not have been in vain.

We now have one shuttle line operated with the one-man car, and are considering seriously its gradual extension into the field outlined above. Our present one-man car is a single-truck type with folding gates, the only change for one-man operation being the locking of the doors on the rear platform. As has already been announced, the Stone & Webster Management Association has designed a light one-man car particularly suitable for the conditions described.

The Use of Coasting Recorders Results in Economies at Vancouver

Although the Saving of Electrical Energy Is Not a Vital Point on This System, the Use of Coasting Recorders Has Been Found Advantageous for Operating and Maintenance Reasons

By W. G. MURRIN

General Superintendent British Columbia Electric Railway, Vancouver, B. C.

One Girl Using Adding Machine and One Girl Recording Coasting Records

OUR preliminary studies with Rico coasting recorders were made on both city and interurban lines early in 1913. Altogether seven clocks were used, and their records were supplemented with watt-hour meters and ammeters, in addition to which one man rode each test car simply to check the running time. The cars were operated by our regular motormen subject to the instruction of the engineers of the Railway Improvement Company, but the records were taken by our own engineers. After several days' run on one group of cars, the instruments were placed on a second group and so on until all important local lines had been tried. We did not make any tests on our long interurban lines as we did not believe that their operating conditions, involving the use of heavy trains, would permit the most effective use of recorders.

As a result of these tests it was decided to equip the Vancouver city lines, numbering about 200 cars. We also installed the Rico terminal clocks on the same lines. This work was completed in the fall of 1913.

In addition to special instruction in coasting, the motormen were invited to meetings at which the coasting clock was fully explained.

At first the records of coasting were maintained by a separate department, numbering five girls, an

outside traveling inspector who examined clocks, and the head of the department. This department has since been merged with the transportation department under the superintendent. The only employees who give their time exclusively to this work are two girls, this being made possible through their increased experience and the use of a Comptometer and slide rule. Instead of employing a special inspector, the mechanical department looks after the clocks like any other piece of equipment, special investigations being made only on daily reports from the transportation department that certain clocks require attention. The traffic inspectors now do the coaching formerly done by the coasting clock inspector.

The coasting records of the individual men are posted every two weeks at each carhouse. In addition, educational bulletins are posted from time to time. Men who show poor records are subject to personal interview with the superintendent.

COMPARISONS AND BENEFITS

In February, 1914, the company, for its own satisfaction, made tests on eight different routes with recorders checked by watt-hour meters. A special inspector with a stop-watch rode on each run to get the actual running time. When averaged these tests showed conclusively that the least energy was

used by the best coasters, and that the drop in energy was proportional to the gain in coasting. A summary of the test is appended.

As experience with the clocks increased and the follow-up work was pursued, the coasting for the entire system rose to 31.2 per cent during the summer of 1914, and we were hopeful that an average of 35 per cent was attainable, although our stops are exceptionally frequent because of very short blocks. Late in 1914, however, about 650 jitneys made their appearance on the streets of Vancouver, and this made it desirable to speed up the lines as much as practicable. Consequently, coasting has been cut down to an average of 22.3 per cent, but at the same time we are giving many more car-miles without any appreciable change in the power bill and at a reduction in platform expense per car-mile from 8.27 cents (June, 1914) to 7.31 cents (June, 1915).

In short, the use of coasting recorders revealed the possibility of higher speeds and therefore of greater ultimate economies than the mere saving of energy where coasting is worked to the limit.

The disciplinary value of the coasting recorder would appear from the fact that despite an increase of speed, front-end accidents are no more numerous than at the lower speed.

Maintenance per car-mile has decreased about 40 per cent during the period since the coasting recorders were installed. Of course, we cannot credit the recorder alone with this reduction because our

RELATION OF COASTING TO ENERGY USE

cars are now inspected at shorter intervals, brake-shoes have been changed from plain iron to the reinforced steel-back type, much equipment has been standardized and other improvements have been made. At the same time we feel satisfied that skillful coasting does not injuriously affect the maintenance of equipment.

TERMINAL CLOCK

The terminal clock has proved a most useful auxiliary of the coasting recorder and also as an aid to inspection service. We do not place the terminal clocks at the terminals but at points five to seven minutes therefrom. This practice eliminates both running ahead of time and loafing at the terminal so that the men naturally try to get over the line in exact time. The result has been that we have been able to reduce our staff of inspectors to half the original number and yet operate at higher speed and efficiency than before.

No. 12

SAN FRANCISCO A. I. E. E. MEETING

The American Institute of Electrical Engineers held two conventions this summer, one at Deer Park, Md., in June, which complied with the constitutional requirements that the annual convention be held prior to Aug. 1, and the other in San Francisco this week. At both meetings papers of great value and immediate interest to electric railway men were presented. All of these indicated that the electrical engineering problems of street and interurban railway and steam railroad electrification are not all solved by any means. And the solutions of these problems affect not only the electrical engineers but they reach out into all branches of the transportation business. It is therefore very desirable that the electric railway industry as a whole keep closely in touch with the experiments and achievements of electrical engineers in this field. At San Francisco two papers were presented which are so directly of an electric railway character that we have abstracted them at length elsewhere in this issue. One of these is commented upon below and the other, by E. W. Allen and Edward Taylor on automatic substations, is discussed more at length on page 576.

PREVENTION OF OVERHEAD ELECTROLYSIS

In his A. I. E. E. paper on this subject, S. L. Foster showed that stray currents can cause trouble elsewhere than underground. The operator of an electric railway which is within reach of salt spray must insulate his overhead construction to prevent surface leakage current as well as against disruptive discharge. This is a lesson learned from the experience described by Mr. Foster. The operation of the laws of electrolysis is as sure as fate. Given two metal surfaces connected by an electrolyte and subjected to a difference of potential sufficient to overcome the chemical affinity of the constituents of the electrolyte, and decomposition is bound to follow. Every ampere-hour of electricity will produce a definite effect in accordance with known laws. It is probable that the experience described by Mr. Foster is unusually severe for, to produce the effect described, there must be a more or less continuous supply of moisture. However, if insulators became coated with salt it would be expected that this material would retain moisture and furnish a conducting path. At any rate, Mr. Foster has shown that recognition of electrolytic laws is the first step in preventing the deleterious effects of electrolysis. The paper illustrates the importance of a knowledge of science in solving practical problems.

APPLYING THE TRAFFIC STUDY

Mr. Doolittle in his concluding article on the subject of traffic surveys, published on another page of this issue, discusses in a clearly detailed and illustrated way the methods of constructing schedules. Although traffic studies may serve as bases for rerouting cars, adjusting transfer points and finding the solution of similar problems, the formation of schedules constitutes on the whole the most important and most practical outcome of such work. This fact is now more widely recognized than formerly in the electric railway field, for most present-day managers have come to see the superiority of scientific operating methods over methods devised by the rule-of-thumb. Perhaps the details of Mr. Doolittle's schedule-making will not be used—circumstances alter local cases—but the principles underlying his plan are an absolute necessity in modern operation. It may be well to note, however, that the operating problem does not end with the completion of the schedule chart, for even then the manager is confronted by the daily task of making trainmen observe their time points and maintain the proper headway, without which a technically perfect timetable would be vitiated. This, of course, is not a traffic survey problem; we mention it only to show that traffic studies are not *per se* a panacea for operating ills unless the conclusions derived therefrom are carried out in an exact and sustained regularity of operation.

PUBLIC OPPO- SITION TO THE SKIP STOP

The opinion of C. B. Wells, expressed in last week's issue, to the effect that the skip stop ought to be a prime factor in the solution of the urban transportation problem is very much to the point. It is utterly absurd to call the service that is given in some communities by the name of rapid transit, and where the street cars crawl along at the rate of 7 m.p.h. or even less the public can hardly be blamed for complaining. Of course, it is true that the public is primarily responsible for such conditions because of an almost invariable and utterly reactionary opposition to rerouting and to the elimination of stops—remedies which would cure some 90 per cent of all dragging schedules. But on the other hand the public can hardly be expected to know enough of transportation problems to grasp these facts instinctively, and herein the responsibility is shifted onto the shoulders of the railway officials. It should not be difficult to educate the public in the simple facts that every stop costs about fifteen seconds in lost time and that the elimination of, say, six

stops would save a minute and a half per mile, increasing a 7-mile schedule speed by more than 20 per cent. The man that has been accustomed for years to boarding his car at the nearest corner to his house will naturally complain when he is obliged to walk farther. The only remedy is to explain to him carefully and patiently that to stop at the corner of every short block is nearly as bad as to stop in front of every house when a person wished to board or leave a car, and that the only way to have real rapid transit is to have the stops a reasonable distance apart.

AUTOMATIC APPARATUS IN SUBSTATIONS

The A. I. E. E. paper by Messrs. Allen and Taylor describes an interurban railway system in which the substation apparatus is automatically connected to and disconnected from the a.c. and d.c. lines. The directing agency is the variation in the d.c. voltage which, everything else being equal, is an indication of the demand for power. If such a system should become popular it would revolutionize electric railway power distribution practice; hence it is most important that the merits and shortcomings of the plan should be carefully investigated. The present experiment has been made possible through the co-operation of Bion J. Arnold, who has always sympathized with attempts to apply remote and automatic control devices. The Arnold plan of power station layout, providing flexible connection of engines and generators, will be remembered as an example of this in the early days of power-plant history. A later example is seen in the Grand Trunk Railroad power plant at Port Huron, Mich., in which the variation in steam pressure due to the fluctuating demand for electric power was utilized to stimulate or depress the activity of the power plant through changes in the speed of stokers, fans, etc.

Of course, the first objection that will be raised in connection with any scheme of automatic control is its complication. This objection will not hold as it might have done in some instances twenty years ago for the reason that power plants and transmission and distribution systems are already to a large extent dependent for satisfactory and safe operation upon automatic devices. The automatic relay is to-day an almost absolutely reliable device, for it simply had to be made reliable. Nearly twenty years ago the critics predicted failure for Frank J. Sprague's multiple-unit train control system because it was so complicated, but he knew that if the apparatus was well made and the wiring carefully installed it was bound to work, and it did work. In the case under discussion we have no doubt as to the ability of engineers to make the automatic substations operate successfully, particularly in the field of interurban railway service with long headway between cars, where it seems to offer the most advantages. A few practical demonstrations like the one described in the paper will supply much desired data as to the actual savings produced by the automatic substation. The number of substation movements per

failure should be stated, together with the cost of the equipment and the net savings. It is important to note that after a half year of operation with one trial equipment the two remaining substations on the line were made automatic. Undoubtedly the automatic substation has its limitations, for reliable operation must depend ultimately upon the human element. If it is injured the automatic station can only put itself out of commission and wait patiently for repairs, although it can in the meantime call for help.

DEVELOPMENT CHARGES

"The law which governs the value of a railroad, as well as every other undertaking for investment, is that it shall yield a profit equal to a fair interest on the whole amount of its cost."

The sentence just quoted sounds as if it had been taken from the brief of an attorney for a railway company in a valuation case now before the court. But it is not. It is found in a book entitled "Street Railways," published by Alexander Easton of Philadelphia in 1859 at a time when horse railways were just beginning to replace omnibuses in New York, Philadelphia, Boston and other large cities, and was in part the answer to the question propounded by the author at the beginning of his chapter "Does the Stock of Street Railways Afford a Secure and Profitable Investment?"

A perusal of this little book, written nearly sixty years ago, is extremely instructive. A large part of it is devoted to proving the superiority of the street car over the bus, its greater economy of time and space on the street, and its higher degree of safety to passengers and pedestrians, all of which is extremely interesting at this time when there is a movement to return to bus operation. We may have occasion to refer again in these columns to some of these early arguments in favor of the street car but will skip over that part of the book now to touch upon some of the managerial and financial questions which it discusses and which, in a way, help us better to understand the genesis of some of the industry's present-day problems.

In the first place, in reading this little book one is struck by the similarity between many of the questions even in those early days and those at present. Thus we find a strong plea for lighter cars in the following words: "Let the purchaser of equipment be guided by a judicious consideration of the local requirements of the business, instead of blindly following the custom adopted by other companies. In the construction of cars the proportion of the paying weight to the dead weight, although in some instances not excessive, in many other is susceptible of material modifications and economy." There is then a calculation of the cost of hauling for a day the excess weight on a car equal to that of a passenger. "The manager must look after these [transportation] matters himself, take his stand on what he thinks is right and insist upon having it," sententiously remarks the author. "The directors of street railways are usually entirely ignorant of the details of the matters over which they have authority;

and even if it were otherwise they could not personally superintend the work under their charge." Again, he says, in speaking of the importance of the selection of an able manager: "Gratuitous services are but temporary and generally terminate in disappointed expectations. Skill and executive labor must be adequately paid for, if expected to be constantly and usefully exerted, and if so exerted, the price is no consideration when compared with the advantages derived." Another statement which throws light upon the early financial practices of the companies reads as follows: "The practice of misapplying capital for the payment of dividends and the charging of current expenses to the account of capital cannot be too strongly condemned. Cases have occurred where the future profitable working of roads has been endangered for years under this system—which, however, suitable as it may be for the convenience of speculators, is fatal to the interest of those who invest permanently."

But perhaps the most interesting part of the book is that relating to the accounts of some of the early companies, including the Sixth Avenue Railroad of New York, Brooklyn City Railroad, Third Avenue Railroad of New York, Cambridge Railroad, Union Railway of Boston, Metropolitan Railway of Boston, and Malden & Melrose Railroad of Boston, all of whose reports and statements of cost of equipment are published. Among the latter are some items which are usually not associated with the earlier developments of horse railroads. Thus the Sixth Avenue Railroad includes in its cost of road and equipment "land damages," and the author speaks as if in a number of cases the railway companies, before building their lines, had to buy up the omnibus interests. Indeed, he says of the Third Avenue Railroad that "the original proprietors of this road are supposed to have bought out five lines of omnibuses at a cost of about \$400,000." Nevertheless, speaking of roads as a whole, he says that "The investments have yielded large and regularly-paid dividends, even on amounts of capital charged to construction, which was partly consumed in the purchase of imaginary omnibus rights and other expenses, amounting in total to nearly treble the actual cost for which the roads without grading and bridging can now be built." In some of the recent electric railway valuation cases before commissions, railway companies have been criticised for including in their statements of cost the purchases which they undoubtedly made of the old horse-car lines. But it seems that they were moderate in their claims and that they might fairly have included omnibus rights for which at an earlier date their predecessor horse-car lines paid substantial sums.

The rates of fare on these early lines varied, being 5 cents on the short lines, but 10 cents was charged for a long ride, as from Boston to Cambridge, and 15 cents was charged between Boston and Mount Auburn or Watertown. Even at these rates capital was not easy to obtain. As an example the author cites the Cambridge Railroad, which he says was the first horse railway built in New England. To raise the money to

pay for the construction of this road the promoters experienced great difficulty, but finally after much exertion subscriptions to the amount of \$43,000 were secured. As this was all that could be obtained the contractor agreed to receive this amount on account of his contract and to take the balance in stock and bonds. The author continues, "By the original terms of subscription each subscriber had the right to take either stock or bonds for the amount of his subscription, but so little faith had the subscribers in the success of the project that of the \$43,000 paid in cash, \$37,000 was taken in bonds and only about \$6,000 in stock."

We have quoted from this early history of street railways not only because of the curiosity of the information but because it shows that street railways even in large cities in those early days were not considered "sure investments," as some would have us now believe. They were not only speculative, but capital was raised only with great difficulty, and the roads had development expenses which are now forgotten or ignored.

AUTOS AND THE ELECTRIC CAR

A few weeks ago we published the results of a census taken in Denver of the number of persons entering and leaving the business district of that city by automobiles, on foot, by horse-drawn vehicles, on bicycles and in the street cars. The striking fact of the study was that 13 per cent traveled by autos, or just about one-fourth as many as traveled by electric cars. The automobiles were all private conveyances, as there are no jitneys in Denver. This is undoubtedly a larger percentage than would be found in most cities as the streets in Denver are well paved and there is an auto for every thirty-six people in the city, but the same condition—that is, an increasing use of the automobile for trips for which the electric car was commonly used—is evident in many cities.

The question is how to combat it, and this Mr. Beeler is doing in part by explaining the facts to the citizens of Denver. His statement, published elsewhere in this issue, discusses the higher cost of automobile transportation and at the same time impresses patrons and possible patrons of the company with their absolute self-interest in supporting and sustaining a first-class electric railway system. It is a strange coincidence that in Denver, as brought out by Mr. Beeler, the estimated annual expense of operating the automobiles, including interest and depreciation, is practically the same as the gross receipts of the electric railway company, yet the automobiles carried only about 18,000,000 whereas the tramway company carried 75,000,000. The main points driven home in the article are that no amount of automobile service can satisfactorily and completely supplant the electric car and that every person who uses an automobile in preference to the electric car does so to the detriment of himself, his neighbor and the city at large. Undoubtedly the automobile has come to stay in every city, but the facts set forth in Mr. Beeler's article are incontrovertible and ought to be realized by every automobile user.

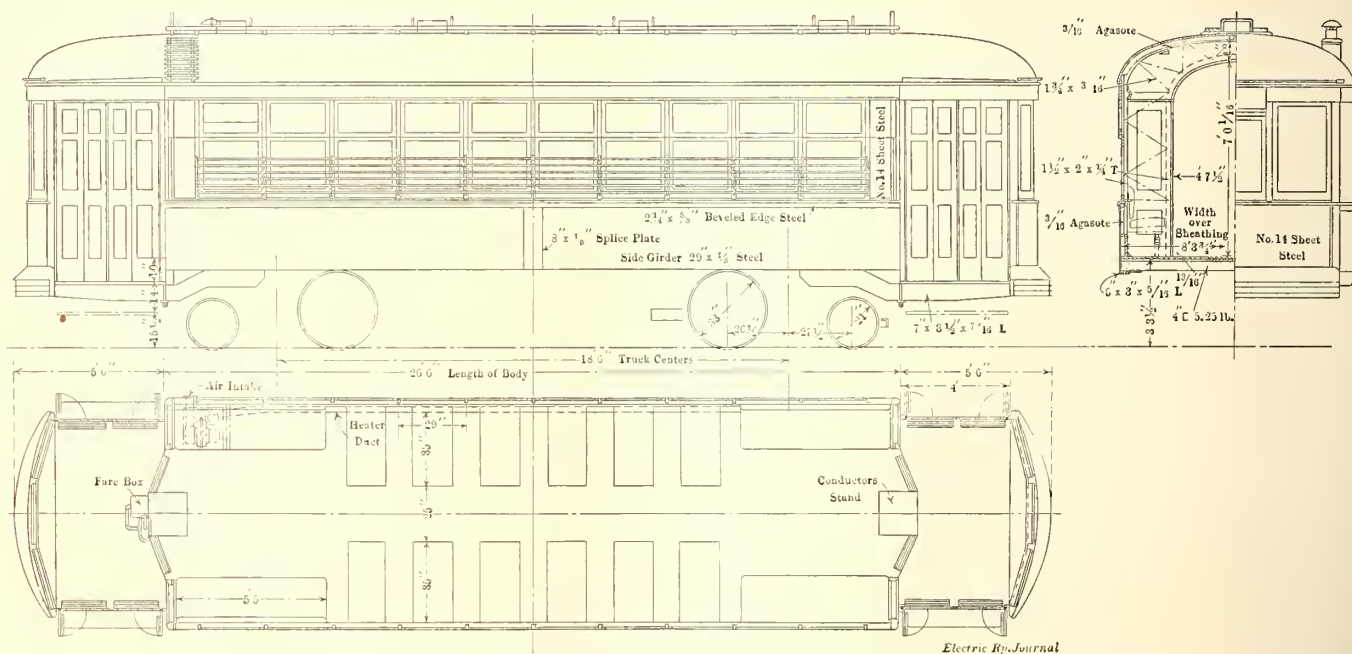

Car Design from a Service Standpoint

General Dimensions of the Cars Recently Placed in Operation by the Empire United Railways Were Established by the Maximum Weight of Body Which Could Be Hauled on a Given Schedule by Arbitrarily Selected Motors and Trucks

The semi-steel cars which have recently been placed in service by the Empire United Railways on its city lines were designed under somewhat unusual circumstances, and the methods used by the company in determining the character of the various general features of the construction possess no small degree of interest on account of their originality. Primarily the design of the car was made dependent, not upon the peculiarities of the existing service, but rather upon those of a proposed service which would give fewer stops and a higher schedule speed together with a materially lower consumption of power.

Within the last few years the urban lines in all three of the cities in which the Empire United Railways are operating, namely, Auburn, Oswego and Fulton, N. Y., were absolutely unprofitable and barely paying their

of car, and in connection with this, power consumption was a vitally important factor. The Empire Railways Company purchases power from the Niagara, Lockport & Ontario Power Company under a flat kilowatt-hour contract without a peak charge or a maximum demand of any kind. Therefore, economy of current consumption is particularly desirable, because every kilowatt-hour saved means saving the full price of the unit of energy and not merely its cost at the coal pile. The management, therefore, determined arbitrarily the size and type of the motor which was best suited to the proposed service, finally concluding to use two-motor equipments of GE 200 motors, which are rated at 33-40 hp. It was also decided to raise the voltage from an average of 525 volts to 600 volts at the car by using boosters where necessary. The decision on the motor largely

EMPIRE UNITED CAR—GENERAL PLAN OF CAR

operating cost. The city service was being taken care of by the ordinary 20-ft. single-truck closed cars and by single-truck open cars in the summer time. In order to rehabilitate the existing service it was considered of primary importance to do away with single-truck car operation and to provide a new type of car which would be of such superior construction that it would, in itself, be an invitation to ride. Furthermore, it was desirable for this car to be able to make a higher schedule speed, thereby reducing the number of cars required.

At the same time the management wanted to lengthen the headway between cars somewhat, although reducing the frequency of cars is, of course, a hard task at any time, being especially difficult in small cities. The new cars, therefore, helped to make the change more agreeable, although the new equipment alone was considered to be justified even without that.

METHOD OF GENERAL DESIGN

After the purchase of new cars was finally decided upon the first thing done was to determine the best type

determined the design of the truck, and the weights of the trucks and electrical equipment could then be estimated.

The desired schedules were then planned out in detail. No lay-overs whatever were provided and the motors were calculated to be in service practically continuously for about seventeen hours per day. The average schedule speed was established at approximately 10 m.p.h. After going over the figures several times and consulting the manufacturers it was finally decided that a car body weighing 16,000 lb. was the greatest weight that could be handled by the motor which had been selected under the conditions of voltage and schedule speed which had been agreed upon. At that it was found necessary to reduce the number of stopping points which had been rather too frequent originally, the intervals being cut down to approximately 440 ft., giving about twelve stops per mile as an absolute maximum.

When the car-body weight had been established the car manufacturers were requested to bid on the biggest

body they could build and keep within that weight. In answer to this, propositions were received which covered cars approximately 38 ft. long over all and seating forty people, and the order for such equipment was placed with the St. Louis Car Company. These cars are now in operation, and while they have not been in service long enough to prove all the contentions which were made when they were designed, it is reported that there is every indication that the conditions will be met satisfactorily.

OTHER CONSIDERATIONS

It will be noted from the illustrations that end platforms have been used, and in connection with the use of this general design as opposed to the center entrance it is of interest to note the following remarks of Ernest Gonzenbach, general manager Empire United Railways, who planned the new cars: "We seriously considered the center-entrance car, but we abandoned the idea for several reasons. One is that our overhead work is not yet in good enough condition so that we dare put the conductor in the center of the car too far away from the trolley rope. Another reason is that the center-entrance car is, according to my opinion, not so fast in loading and unloading as the end-entrance car in which the rear door is used as an entrance and the front door as an exit. Furthermore, the end-entrance car with front exit automatically distributes the standing load over the entire car, whereas with the center-entrance car a standing load is hard to move away from the door. Again, in small towns where there are many unpaved streets, and where a car must stop with the rear platform clear of the street line, the center entrance will cause the public to get in and out in the mud if the street is not paved."

In connection with the general design it may be said that the company spent a good deal of money in investigating the new types of single trucks with radial axles. These met with considerable favor, but it was not thought that the art was sufficiently advanced to put too much faith on this design with the prevailing poor track conditions in the cities in which the company operates. On the other hand, the double-truck car had

EMPIRE UNITED CAR—INTERIOR VIEW, SHOWING OPEN BULKHEAD

the faculty of smoothing out and remedying some of the track inequalities that would produce a very pronounced effect with a single-truck car.

In general, the new car may appear to be somewhat small in view of the fact that a larger car might just as well have been built. As opposed to this, however, the company would have had to put on a larger motor, and inasmuch as the rush periods in the small cities where the cars operate are exceedingly brief it was proved that it would be more wasteful to haul around the extra weight in motors and car during the non-rush hours than it would be to handle the peaks with trippers. The latter have to operate only for approximately 3 per cent of the time, as peak conditions exist for only three-quarters of an hour in the cities in question.

Simultaneously with the retirement of the closed

EMPIRE UNITED CAR—EXTERIOR VIEW, SHOWING FOLDING DOORS AND STEPS

single-truck cars, the company has retired from service all of its single-truck open cars and will hereafter run nothing in the cities except the new closed cars and double-truck fourteen-bench and fifteen-bench open cars for summer service. Every car operated in city service will be provided with air brakes. The company plans also to adopt in its city service a scheme which has turned the tide on other unprofitable city properties. Each car will be equipped with a clock in front of the motorman which will give time points, and the city schedule will be as rigidly adhered to as if it were that of the "Twentieth Century Limited." Furthermore, time-tables will be published showing the schedule time for every street corner past which the cars operate. By thus keeping the public informed, there has been built up in other cities traffic which has been two and three times what it was before such service was inaugurated, and it is fully expected that the same thing will be done on the properties under discussion.

DETAILS OF CONSTRUCTION

In general the arrangement of the car body conforms to the customary standards of the pay-within type for double-end operation. The car construction is of the side-girder type with drop platform, open bulkheads, continuous T-bar side-posts, plain arch roof with detachable bonnets and closed vestibules.

The steel framework includes side sills of 5-in. x 3-in. x 5/16-in. angles made in one piece and bent around the corner posts and spliced at the center line of the car to form the end sill. The side-sheathing which forms the steel girders is 29 in. high and 1/8 in. thick. This also is bent around the corner posts and extends inward as far as the bulkhead post. The side plates are spliced at the middle of the car, but the belt rail is made of 2 1/4-in. x 3/8-in. bevelled-edge steel in one continuous piece.

The flooring is of 13/16-in., tongued-and-grooved maple nailed to white-oak nailing pieces which are bolted to the cross-bars of the steel underframe, the floor of the car body extending out into the vestibule to form the conductor's stand. The side posts are made of 1 1/2-in. x 2-in. x 1/4-in. T-bars running in one continuous piece from side sill to side sill and forming the carlines. These are spaced on 29-in. centers and they are anchored at the side sill and girder plates below the windows and bolted to a wooden letterboard at the top. The roof and bonnets are sheathed with wood and covered with painted canvas.

The weights of the various parts of the equipment which go to make up the complete car and the general dimensions are as follows:

Weight of car body.....	16,000 lb.
Weight of trucks.....	10,500 lb.
Weight of electrical equipment.....	4,500 lb.
Weight of air-brake equipment.....	900 lb.
Total weight.....	32,000 lb.
Length of body over corner posts.....	26 ft. 6 in.
Length of body over bumpers.....	37 ft. 6 in.
Width over drip rail.....	8 ft. 6 in.
Height to top of roof.....	11 ft. 3 1/2 in.
Height of rail to floor.....	3 ft. 3 1/2 in.
Distance between truck centers.....	18 ft. 6 in.
Diameter of wheels.....	33 in.

The capacity of forty is provided for by longitudinal seats seating sixteen at the ends of the car body and twenty-four transverse seats in the center portion, the longitudinal seats having been introduced to increase the facility of entering and leaving the car, as it is intended for double-end operation. One of the longitudinal seats has a removable section so that a Consolidated hot-air ventilator stove can be installed at one corner of the car in winter time, this being sheathed with transite when in place.

The platform door openings are 4 ft. wide and the doors are of the double-folding type on both sides of

each vestibule, the upper half of each being glazed with clear glass and the lower half with wire glass. They are all manually operated, a handle at the conductor's stand controlling the rear entrance and another handle convenient to the motorman controlling the front-exit door.

Railway Signal Association Convention

Switch Indicator Practice, Economics of Signal Maintenance and Principles Governing Capacity of Single Track Discussed

The annual convention of the Railway Signal Association was held in Salt Lake City on Sept. 14-16, 1915. Reports were presented by eight standing committees and two special committees, among them being several that are of special interest to electric railways. The committee on signaling practice included in its report a statement to the effect that either conveniently located signals or switch indicators on single track may serve the same purposes as switch indicators that are installed on roads of two or more tracks. The following statements of switch indicator practice on single track were also submitted: Where signals governing movements in both directions are located so near a switch that trainmen at the switch can observe their indications, such signals will give the necessary information and switch indicators are unnecessary. Where a signal governing in one direction is located as above, and a signal governing in the opposite direction is not so located, a switch indicator may be used to give the information not obtainable from the signal. Where signals governing in both directions are not located as above two switch indicators may be used, one for each direction. Each switch indicator may, as to trains in one direction, serve the purposes and be controlled in the same way as on lines of two or more tracks. In the case of a system in which a train moving beyond one passing siding controls signals governing opposing movements between that passing siding and the next, a switch indicator may be so controlled as to indicate the approach of a train at and from the signal located adjacent to the next passing siding.

The report took up also the economics of signal maintenance, stating that, because the main controlling power of signal apparatus is electrical and because the special training required is special, a combination of signal and track forces is not to be recommended as a means of obtaining economy and efficiency in signal maintenance. Occasionally, however, it will be found practicable and economical to combine forces engaged in maintaining various electrical features on a railroad with those maintaining signals. But as a general proposition, economy and efficiency will be produced to a higher degree by co-operation and by combination, and this rests entirely with the officer in charge in the arrangement of the forces available.

An extended discussion on the laws affecting the capacity of single track was submitted also in the report. Among the several fundamental rules that were developed was one to the effect that the maximum capacity of a railroad with a given number of passing sidings is reached when the sums of the schedule times of the east-bound and the west-bound trains between each pair of passing sidings are all equal. This rule applies whether or not the speeds are uniform, and it will determine the best location for passing sidings to produce maximum capacity. Another rule that was developed was that the maximum number of trains of one class that can be run in twenty-four hours over a piece of railroad equals 2880 multiplied by the number of passing sidings plus 1, divided by the sum of the

running times of an east-bound and of a west-bound train over the road plus the number of sidings plus 1 multiplied by the delay caused by a train taking the passing sidings. This formula is expressed as follows:

$$T = \frac{2880 (N + 1)}{E + W + (N + 1)a}$$

Of course, if a single-track line is short, a greater number of trains can be moved by utilizing the road for trains in one direction only for part of the day and in the other direction for the other part of the day. This is not, however, ordinarily practical and need not be considered. If it should happen that traffic in one direction is greater than the other it is perfectly practicable, if suitable signaling is provided so that the following distance between trains is not too great, to run trains in one direction in two sections and in one section in the opposite direction. This gives the following formula in which T equals the number of trains per day, W equals the time of the west-bound train over the road, E equals the distance of the east-bound train over the road, N equals the number of sidings, a equals the delay caused by a train taking the passing sidings, and f equals the spacing between the parts of trains run in two sections:

$$T = \frac{A \ 320 (N + 1)}{W + E + (N + 1)a + (N + 1)f}$$

With regard to the effect of the number of passing sidings upon the capacity of the road it may be said that in a time that is equal to the sum of the running time of two opposing trains over a certain territory there will always be space on the track for two more trains than twice the number of passing sidings. But, while the capacity increases with the number of passing sidings the time required to cover the territory is rapidly increased. If trains are run in two sections in one direction the average running time per train is:

$$R = \frac{W + E + (N + 1)a + Nf}{2}$$

If the trains are run in two sections in both directions the formula becomes:

$$R = \frac{W + E + (N + 1)a + N2f}{2}$$

All of the foregoing formulas apply only to conditions where trains are of a single class, and they assume that the sidings are so spaced as to provide equal running time between each pair of sidings all over the road. In practice, however, sidings are not equally spaced and under these conditions the traffic situation on any piece of road may be analyzed by setting down the full schedule running time (including delays due to taking sidings and other causes) in a series and adding the west-bound and east-bound schedule times between each pair of sidings. The maximum sum in the list will establish the capacity of the road. For example, if the maximum sum of the east-bound and west-bound schedule time between any two sidings is fifty-three minutes there will be two trains passing in each fifty-three minutes, or fifty-four trains per day.

It is obvious, of course, that if this maximum sum can be decreased, the number of trains moved over the line will be increased. This result may be accomplished by moving nearer together the two sidings between which the maximum running time takes place. It will not pay, however, to move the sidings more than enough to decrease the sum of the schedule times below the next highest in the list, as the next highest would then become the limiting point. To arrive at the maximum theoretical capacity, of course, it would be neces-

sary to move all sidings so that the sum of schedule times between each pair was constant, and where the actual sums of the schedule times between sidings is even approximately equal this would not pay. The report shows a case wherein the minimum sum was thirty-one minutes and the maximum forty-two minutes, but the theoretical maximum capacity is only six trains per day or about 9 per cent more than the actual capacity.

The committee on electric railway and a.c. signaling stated that Western railroads were progressing with the installation of alternating-current signaling and submitted brief descriptions of a number of alternating-current installations on steam and electric railways, all of the latter having been mentioned from time to time in the *ELECTRIC RAILWAY JOURNAL*. Specifications for reactors for line and track surface were also submitted by this committee.

A special committee on electrical testing submitted a progress report which was abstracted in the *ELECTRIC RAILWAY JOURNAL* for May 29, 1915, and requested further discussion of a constructive nature on the subject for the guidance of the committee so that its efforts toward future work might be productive of the best results. Another special committee, that on lightning protection, presented requisites for lightning arresters for signaling and requisites for choke coils for signaling, as well as specifications for vacuum-gap lightning arresters.

The Auto-Train at the Exposition Grounds

Descriptive articles of the Fadgl Auto-Train trackless system of transportation in the exposition grounds at San Francisco were contained in the *ELECTRIC RAILWAY JOURNAL* for April 17 and July 10. Twenty trains, each consisting of an automobile tractor and three trailers seating 1200 passengers in all, are in regular operation through the exposition grounds daily. Two terminals are maintained, one at the Fillmore Street entrance and the other at the Massachusetts State building at the end of the Avenue of Nations and the Avenue of States.

The schedules are worked out and operated in regular electric railway style. The fare from terminal to terminal and intermediate points is 10 cents, the schedule being such that passengers who desire to do so can travel continuously around the grounds for a rate of about 50 cents an hour, additional fares being collected at each terminal.

The high carrying capacity and economy of the Fadgl trackless train is shown by the fact that a three-car train will carry as many passengers as sixteen jitneys in one-fifth of the space with about the same expense for tires and gasoline and with but one chauffeur and one conductor instead of sixteen drivers. The seats on the train can be made crosswise, although the type in use at the exposition has longitudinal seats. This system is believed to have good possibilities for operation elsewhere than in fair grounds and parks alone. For example, one steam railroad is considering it as a feeder from cities several miles distant from the main line. Certain suburban applications also appear feasible. The Fadgl auto-train is even being considered for service in the narrow streets of Asiatic cities.

The general shop force of the Illinois Traction System at Decatur, Ill., is planning to lay out a park on the east side of the shops. A flagpole was raised recently on this plot and a baseball diamond will soon be marked out.

Electric Railway Papers at A. I. E. E. Panama-Pacific Convention

Electrolytic Corrosion of Overhead Material in Damp Locations and the Automatic Substations of the Elgin & Belvidere Electric Railway Were Among the Topics Discussed—Abstracts of Papers on These Topics Are Given

A special convention of the American Institute of Electrical Engineers was held in San Francisco from Sept. 16 to Sept. 18, immediately preceding the International Engineering Congress. Twenty-six papers were presented, including those delivered before joint sessions of the Institute and the Institute of Radio Engineers and the Institute and the American Electrochemical Society. Two papers of immediate interest to electric railway men were those on "Automatically Controlled Substations" by E. W. Allen and Edward Taylor of the General Electric Company, and "Overhead Electrolysis and Porcelain Insulators," by S. L. Foster, chief electrician United Railroads of San Francisco. Other papers of great value and interest, of a more general nature, were one by B. G. Lamme on "Physical Limitations in D. C. Commutating Machinery" and the symposium on "Inventories and Appraisals of Properties" by C. L. Cory, W. G. Vincent and W. J. Norton. On account of space limitations only the two papers first named will be abstracted here.

OVERHEAD ELECTROLYSIS AND PORCELAIN STRAIN INSULATORS

In his paper on the above subject Mr. Foster stated that in electric railway construction in damp climates, and more or less in all climates, there is some leakage of current from the trolley wire to the earth through the insulated supports. This current produces corrosion of span wire and insulators through the separation of water into oxygen and hydrogen, and the attacking by the oxygen of the metal immediately adjacent to the insulation. In the case of galvanized iron the zinc covering is soon removed and the iron is acted upon vigorously by the oxygen. This effect is seen on the bolt that fastens the trolley ear to the trolley hanger, the threaded lower end being badly corroded even though smeared with thick oil on installation. The electrolytic action is also seen in the film of green copper salt that spreads from the head of the brass ear over the lower surface of the cone to the iron hanger, in cap and cone construction.

The mechanical effects of the corrosion are also important, the cap and cone insulator being split in various directions and having its insulating value destroyed. This splitting of the cap has been reduced by hot-dip galvanizing of the stud before the insulation is pressed upon it in the process of manufacture.

Creepage-electrolysis effects are also seen in globe strain insulators which, when exposed in a damp climate for a few months as the only insulation between an un-insulated curve hanger and the pole, even in the case of a wooden pole, will show a heavy ring of iron rust around the shank of the eye on the end of the insulator toward the trolley wire and a white zinc efflorescence on the end toward the pole. The interior, upon crushing, will be found to be clean and intact. In time this oxidation will split the spherical composition insulation open in cracks at the end toward the trolley wire. It seems to be due to simple electrical leakage over the surface of the insulator, the current being too small to be measured with an ammeter and the leakage causing no "hot" poles or open circuit breakers.

Another phenomenon of an electrolytic character appears in connection with the leakage of current along span wires and guys. The current seems to pass off from the exterior of the live wire, first removing the galvanizing and then attacking the iron. In moist climates and especially where exposed to salt spray, extra or double-galvanized strand, when used where leakage current along it is possible, rapidly becomes denuded of its covering, gets red with rust, becomes pitted and quickly loses its tensile strength as if the wire, being positive to the earth, were discharging to the moisture of the atmosphere throughout its whole length.

STRAIN INSULATORS

In order from top down—Single link for small porcelain insulator; single link, small insulator and span wire installed on pole band; double link for small insulator; double link, small insulators and No. 0000 standard copper feed-in or tap-off cable used as a span wire; triple link with triangular link for large insulators at pull-off or strain poles, used to support overhead curves; same in position on poles; long wood strain insulator used in fog-exposed locations; double link and large insulators used in dead-ending and insulating 1,000,000-circ. mil cable.

A partial remedy for this is painting. The same kind of corrosion occurs when bare copper is used for guys and spans unless the wires are oiled or painted. That the trolley wire does not show effects of the action is supposed to be due to its being protected by a film of oil thrown upon it by the passing trolley wheels.

These points seem to teach that it is not only the ability to pass high insulation, puncture and flash-over tests of the trolley wire devices, nor the crushing strength of the composition, that is important, but the securing of a creepage distance proportional to the conditions met with, so as to stop the flow of current around the outside of the insulating parts. It seems clear that the surface exposed for creepage is not enough under fog conditions in our present standard devices. The hanger insulation should be reinforced by a generous amount of permanent creepage distance in the span-wire insulation.

The insulation of the iron pole in its concrete setting helps to neutralize the results of creepage. Leakage is not confined to iron poles, but occurs on wooden poles on which there should always be a sufficient strain insulator in the span wire at either end. In the case of iron poles if one strain insulator does not suffice two should be used, one about 2 ft. from the trolley and one 6 ft. from the pole. If two do not check the corrosion, insulators with more creepage distance, as, for example, long wooden insulators, should be used. The latter, however, lack the tensile strength and interlinking feature of the disk, cubical or "goose-egg" porcelain insulator.

Some companies give two coats of linseed-oil paint, applied by dipping, to all galvanized-iron strand intended for overhead use in connection with electric railway work. It costs far less to apply the paint by immersion than with brushes after the wire is in place. All joints made by linemen in galvanized wires or cables should receive at least one coat of paint. All overhead parts should be painted before installation, and when poles are painted all wire and cable joints, strain insulators, etc., within reach of the painters should be covered liberally.

Another form of overhead electrolytic action met with in railway work is caused by the use of dissimilar metals in contact. Galvanized-iron cables attached to the brass eyes of curve hangers, of spherical strain insulators, etc., are rusted off at the points of contact. The sulphuric acid found in the air of cities from the combustion of coal and from the escaping fumes of chemical works, the salt spray and ozone from a near-by ocean, etc., are thought to be the electrolytes that serve to start a local battery action. This action probably explains some of the corrosion at the threads of the hanger bolts which results in loose hangers in the ears. The logical remedy for this is to use similar metals in contact. Galvanized-iron parts should be used for all overhead trolley work. Applying a heavy oil to the thread of the hanger bolt is a palliative.

Still another form of probable electrolytic corrosion is seen in the wasting away of iron poles at the top of the concrete setting. Exceptionally rusty pole bases should lead to investigation of the condition of the insulation in the span wire and at the ear.

EXPERIENCE IN SAN FRANCISCO

In San Francisco problems involved in the above considerations presented themselves early and have been solved one after another, producing not only improved conditions electrically but increased strength mechanically, reducing original and maintenance costs, and yielding greater safety for the workmen and greater rapidity of work.

Electrolysis from the combination of the brass eye in the strain insulator and the galvanized-iron strand was remedied by using galvanized iron eyes. These are stronger and last longer. The failure of strain insulators formerly resulted in the first rain storm of winter being a source of dread to the linemen on account of the "hot" poles. Between the years 1893 and 1901 every kind of strain insulator on the market was tried, and in the latter year a porcelain cubical or "goose-egg" insulator was adopted, since which time there has been no trouble. Where there was little or no fog a single porcelain insulator was used at each end of the span wire, but where the fog was heavier or there was a feeding cable from a feeder used as a span wire, two insulators were used instead. On particularly exposed lines along the cliffs around the Golden Gate even two insulators of a larger size did not suffice and long wood strains had to be substituted.

The porcelain insulators used are of two sizes. In connection with them hot-dip galvanized wrought-iron welded links are used in the following form: single links for pole band attachment, double links for feeding at the pole or feeder cable dead-ends, triple links with triangular bull-rings for curved pull-off poles. The links for the small insulators were made of $\frac{3}{8}$ -in. round Norway iron and those for the large ones of $\frac{1}{2}$ -in. round Norway iron. The triangular bull-rings were made of $\frac{5}{8}$ -in. steel.

The small insulator has a diameter of $2\frac{3}{4}$ in., a length of $3\frac{1}{2}$ in. and stands a dry flash-over test, when new, of 10,000 volts. The large insulator is $3\frac{1}{4}$ in. in diameter, 5 in. long and tests dry to 30,000 volts. The small insulator is used in all spans and guys except those under extraordinary strain, such as dead-ends for trolley wires, 1,000,000-circ. mil cables, etc.

Experience has shown that for all 500-volt d.c. electric railway strain insulator work, except under extreme fog condition, it has been proved that in San Francisco practice, where there is neither snow, ice nor sleet and but little lightning, porcelain is the best material. It is incombustible, nearly indestructible, invulnerable to atmospheric action, requiring no original or subsequent preservative treatment, painting, testing or other attention and having high compressive strength combined with small dimensions, etc.

In San Francisco fog practice the size of the span wire has been increased from $\frac{1}{4}$ to $5/16$ to $\frac{3}{8}$ in., and of guys from $5/16$ in. to $\frac{3}{8}$ in. to $\frac{1}{2}$ in., in order to lengthen the life of these cables. On the cliff line the overhead strand formerly lasted only about two years. When one large porcelain insulator did not answer two in series were tried on this wood-pole construction. Then wood-strain insulators 5 in. between heads were tried, only to have the iron heads corrode off rapidly. Wood-strain insulators $15\frac{3}{4}$ in. between heads seem to increase the life of the galvanized strand, although the heads toward the trolley wires show the characteristic electrolytic action. Home-made wood-strain insulators 24 in. between conductors are now being made and are expected to insure reasonable durability of the exposed, extra-galvanized cables which had been given two coats of heavy linseed-oil paint previous to being put in place. The insulators are of maple, are boiled for twenty-four hours and cooled in linseed oil before painting, and are $2\frac{1}{2}$ in. in diameter, octagonal in section. They test to 5000 lb. without showing signs of distress.

AUTOMATICALLY CONTROLLED SUBSTATIONS WITH PARTICULAR REFERENCE TO THEIR APPLICATION TO INTERURBAN ELECTRIC RAILWAYS

In their paper under the above title Messrs. Allen and Taylor described a substation of the Elgin & Belvidere Electric Railway connecting Elgin, Marengo and Belvidere, Ill., in which substation the rotary converter is automatically started and put into service, and stopped and disconnected from the line through the agency of the variation in voltage. Automatic equipment was installed in the Union substation in December, 1914, and in August, 1915, the remaining two substations of the railway were equipped with automatic control. In rough outline the operation of the equipment is as follows: For automatic control, the main a.c. and d.c. circuits are opened and closed by contactors which are directly operated through a motor-driven drum controller, which in turn is controlled by other contactors and relays, the ultimate control residing in a contact-making voltmeter and its accompanying relays. Lowering of line voltage causes the putting of the substation into commission, while raising of the voltage shuts it

AUTOMATIC SUBSTATIONS—EXTERIOR OF UNION SUBSTATION

down. The details of the operation are described later in this abstract.

In introducing their subject the authors pointed out that there is an essential difference between an automatic equipment and a remotely-controlled system with a separate feeder to each machine. In the latter the operation of starting and stopping the machines is performed by an attendant in the station from which the power is supplied. Automatic-control devices are already in satisfactory use and electrically operated switches are reliable devices, careful inspection at regular intervals being sufficient to insure their successful operation. The authors therefore conclude that it is practicable to dispense with the services of an attendant in many railway substations and, proceeding for the moment on the assumption that it is practical to do this, they enumerated some of the effects of automatic control.

ADVANTAGES OF AUTOMATIC CONTROL

The necessity for having two or even three shifts of skilled attendants, as heretofore, influences the number, size and location of substations, and these have in turn affected the amount of feeder copper and consequently the choice of trolley voltage. It is desirable to increase the number of stations and to decrease the relative size of the machines if they are automatically controlled. If the buildings are designed with particular reference to their ability to house apparatus and without regard to the comfort and convenience of the operator, it is probable that their total cost will be no more than for fewer stations designed to meet both of these conditions.

There will be a saving in feeder copper resulting from the shorter distance between substations and also from the better distribution of load. The following example illustrates this: Assume a single-track road 32 miles in length, using 40-ton cars, each equipped with four 75-hp. motors, capable of making a maximum speed of 30 m.p.h. and a schedule speed of 24 m.p.h. with one stop per mile and a rate of acceleration of 1.1 m.p.h.p.s. Assume also that the track is laid with 70-lb. rails and that a No. 0000 trolley wire is used. It is estimated that with three-hand-operated 500-kw., 600-volt stations located 12 miles apart and with 4-mile stub-end feeds, 262,000 lb. of feeder copper will be needed. If six automatically controlled substations, each of 250-kw. capacity, were used, no feeder copper would be required.

In the automatically controlled substations there are also operating advantages in connection with the short feeders, which advantages are increased by the practice of cutting resistance into the circuit to limit the substation output instead of allowing the circuit breakers to open, as is usually done. The authors state that a 500-kw., twenty-five-cycle synchronous converter may be readily started from rest and connected to the line in thirty-five seconds and a 300-kw. unit in twenty-five seconds, while induction motor-generator sets, in capacities below 1000 kw., may be started in considerably less time than is required to start synchronous converters of corresponding size..

The light-load losses are a fairly high percentage of the total energy supply to substations on a system having infrequent car service. It is estimated that $\frac{1}{2}$ kw.-hr. is required to start and connect to the line a 300-kw., twenty-five-cycle, 600-volt synchronous converter. The running-light losses of this machine are 0.34 kw.-hr. per minute. The load conditions in the substations of a single-track road having a ninety-minute car service often justify shutting down a 300-kw. synchronous converter twelve hours during each day. Automatic starting will, therefore, save the running light losses and, if the passenger and freight business at a substation requires the services of an agent, will give him more time for other duties.

DETAILS OF TYPICAL AUTOMATIC SUBSTATION

The Elgin & Belvidere Electric Railway operates a standard-gage single-track 600-volt system and purchases energy from the Aurora, Elgin & Chicago Railroad at 26,000 volts, three-phase, twenty-five cycles.

AUTOMATIC SUBSTATIONS—INTERIOR OF UNION SUBSTATION, AUTOMATIC EQUIPMENT INDICATED BY ARROWS

Each of three substations contains a standard 300-kw., 600-volt, twenty-five cycle, three-phase synchronous converter, three 110-kw. converter transformers, a reactance coil, a high-tension panel and switching equipment, and three low-tension panels. The equipment of one substation, including automatic apparatus, is shown in an accompanying illustration. The diagram reproduced herewith shows the complete electric circuits, the connections for hand operation being at the right, and those for automatic operation at the left. A double-throw switch, 8, permits change-over from one method of operation to the other, being thrown up for automatic and down for hand control.

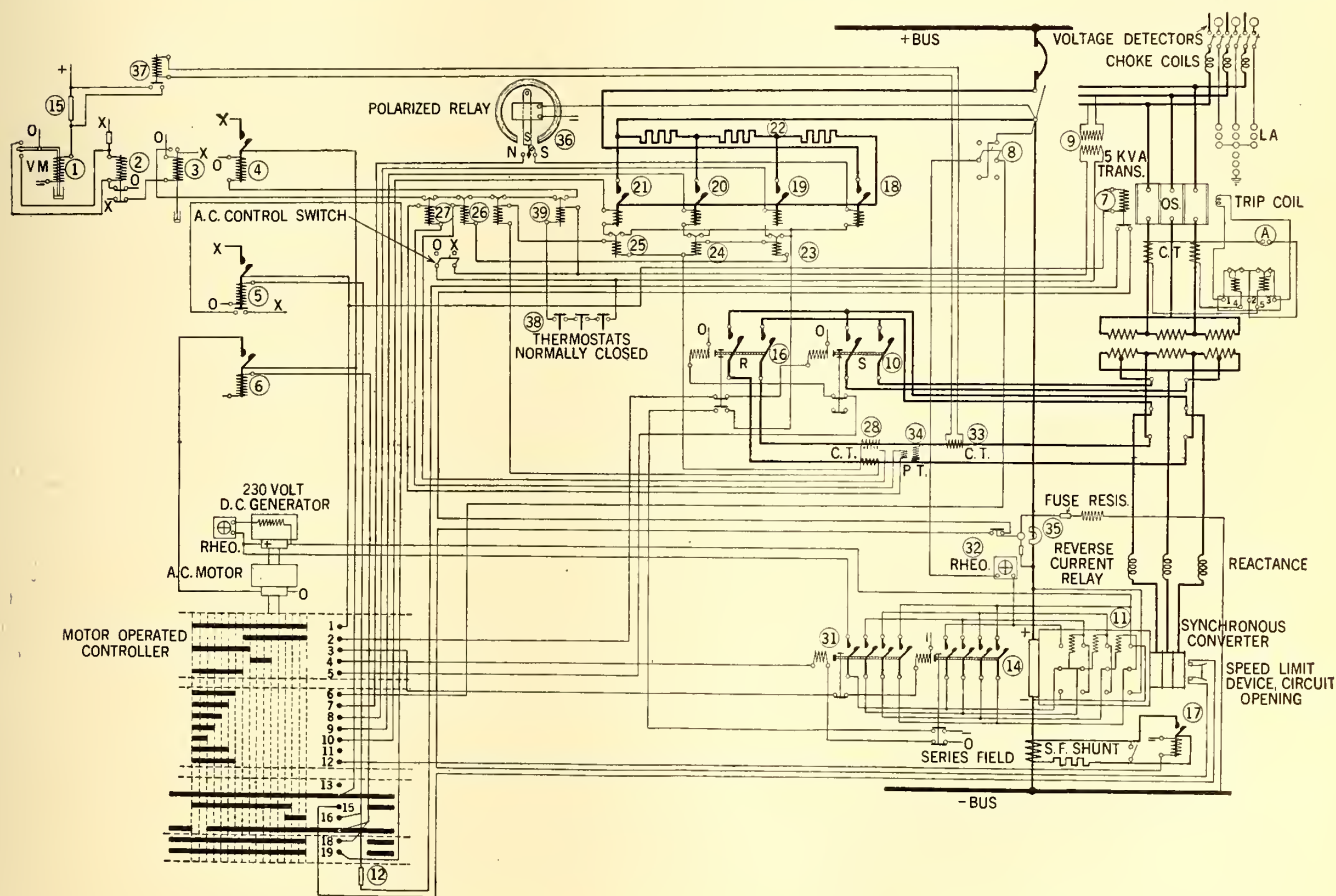

As previously stated, the ultimate control is in a contact-making voltmeter, 1 in the diagram, permanently connected from the overhead trolley line to the negative rail. It is provided with a moving plunger connected to a pivoted contact arm which moves between upper and lower studs. The contact arm touches the top stud in the low-voltage or open-circuit position, and the closing of this contact is the initial movement for starting the rotary converter. The arm does not leave the upper post until the voltage exceeds 500. The lower stud is the cut-out position and the movable arm reaches it when the trolley potential exceeds 600. The contact arm as shown in the diagram is in the mid-position and indicates approximately 550 volts. A dash pot con-

nected to this arm retards its movement about six seconds and prevents it responding to momentary fluctuations in the voltage. In circuit with the voltmeter winding is a high resistance tube, 15, normally short-circuited by the auxiliary contact of current relay 37. If more than a predetermined amount of current flows through this relay its plunger and disk are raised, removing the short-circuit from the high-resistance tube and placing this resistance in circuit with the magnet coil of the voltmeter. This action is equivalent to a condition of low voltage.

THE STARTING OPERATION

The operation of starting the substation is briefly as follows: When a car or train enters the zone of the substation the trolley potential will gradually be reduced to 500 volts. The voltmeter arm will touch the upper stud and complete a circuit through the magnet coil of relay 2, short-circuiting its contact studs. It should be noted that, in the diagram, the authors have for simplicity used the symbols *X* and *O* to indicate that the circuits return to the a.c. control switch, while the symbols $+$ and $-$ indicate that they lead to the rotary d.c. terminals.

The upper disk of relay 2 closes a holding circuit for its plunger, while the lower disks energize the magnet coil of relay 3. Relay 2 serves the double purpose of

removing the arc from the contacts of the voltmeter and acting as a switch for completing the circuit for relay 3. The latter is so constructed that the plunger drops slowly for two and a half minutes without opening its top contacts so as to provide against the station being shut down when the only car in its zone ceases to take energy and stops for a short time to load freight or receive train orders. When this relay is energized the plunger rises instantly and completes a circuit through the interlocks of relays 26, 27 and 39, the functions of which will be described later. It also excites contactor 4 which supplies current to one of the main studs of contactor 6 and to finger 14 of the drum controller.

This controller drum is divided into four sections insulated from each other, the contact segments on each being electrically connected. In the off position of this controller, as shown in the diagram, finger 14 is in contact with finger 17 through which the magnet coil of contactor 6 is energized.

When contactor 6 closes, current is supplied to the a.c. motor used for driving the drum controller. This motor operates only during the time the converter is being brought up to synchronous speed and connected to the line, requiring about thirty seconds. As the controller drum is rotated toward the right, the short segment opposite finger 16 makes momentary contact with its finger and energizes the magnet coil of contactor 5. The closing of contactor 5 energizes controller finger 1 and completes the circuit for closing the high-tension switch by means of coil 7. Contactor 5 is in reality a master switch, all of the circuits required for operating the main solenoid switches being supplied through its main contacts. When it is opened all of the main solenoid switches immediately resume their normal or open positions. Contactor 5 can be closed only when finger 16 engages the short controller segment opposite. Contactor 5 may, however, be held closed, although it will not pick up through the segment which bears upon controller finger 15. It is important to note that the starting position is definitely fixed by the length and location of the short segment opposite finger 16, and that at no other position of the controller can any device be closed unless finger 16 has first been energized and coincident with this an uninterrupted circuit has been established through finger 15.

As the motor-operated controller is rotated by the motor the following operations ensue: When finger 16 was energized, finger 2 was also energized from finger 1, closing the circuit to the magnet coil of the double-pole a.c. contactor marked *S*. The closing of *S* places half voltage on the slip rings of the converter. The armature then starts, reaching synchronous speed in about fourteen to fifteen seconds. Controller finger 4 then engages its segment and energizes the four-pole contactor, 31, closing it and momentarily placing the field of the converter across the terminals of the d.c. exciter, and fixing the polarity of the converter. Segment 4 runs off in four seconds, dropping contactor 31, but finger 3 engages its segment and closes field break-up switch 14, placing the shunt field of the converter directly across its own armature. Finger 2 then disengages and finger 5 engages a segment, contactor *S* being opened and contactor *R* closed and full a.c. voltage is applied across the slip rings. Contactors *S* and *R* are electrically and mechanically interlocked.

Full d.c. voltage is now available and finger 6 of the controller is energized from the positive terminal of the converter. Contactor 17 is closed by finger 12 and the circuit closed to the series field shunt. The moving contact of polarized relay 36 closes the circuit through finger 7 and energizes the magnet coil of contactor 18. If the contact circuit is complete, contactor 18 connects

the positive side of the converter to the positive bus through a cast grid of 0.7-ohm resistance, which resistance is cut out in steps.

The drum controller has now advanced to its full running position and finger 17 has disengaged its segment and opened the holding circuit of contactor 6, stopping the motor.

PROTECTION DURING OPERATION

The diagram shows the connections of the protective devices. Relays 23, 24 and 25 open on 700, 800 and 900 amp. respectively, cutting in the resistances previously cut out. It will be observed that contactors 19, 20 and 21 take the place of the standard circuit breaker. A short-circuit in the machine operates inverse time-limit, overload relay 26, which opens contactors 4 and 5 in turn. Low-voltage, a.c. relay 27 breaks its auxiliary contact if the voltage falls more than 10 per cent below the normal value. The thermostats marked 38 afford protection from overheating. The thermostats are located in the bearings and in the air currents from the armature ventilating ducts. Reverse-current relay 35 opens master contactor 5, which is also opened by the mechanical, speed-limiting device on the converter armature shaft.

OPERATION OF SHUTTING DOWN

The substation automatically shuts down as follows: When the current decreases so as to drop the plunger of relay 37, the voltage now being 600 above, the voltmeter arm engages the lower contact short-circuiting the magnet coil of relay 2 and opening the magnet circuit of relay 3. At the end of two and one-half minutes the plunger of the latter opens the holding circuit of contactor 4, de-energizing controller finger 14 and dropping out master contactor 5. When contactor 5 opens the lower contacts close, energizing controller finger 19, which in turn energizes finger 18 and closes contactor 6, starting the motor and restoring the controller to the original position as shown in the diagram.

The Golden Gate Cover Picture

The remarkable photograph of the Golden Gate which forms the cover design of the Convention Issue of the *ELECTRIC RAILWAY JOURNAL* was taken from San Francisco Bay at a point opposite the Tower of Jewels, the central feature of the Panama-Pacific International Exposition. It is the work of Willard E. Worden, who has specialized for years in Pacific Coast marine and landscape photography. Mr. Worden's reputation as an artist has been recognized by the exposition jury of awards which has granted him the gold medal of honor for the best collective exhibit of art photographs by an individual exhibitor. This exhibit may be seen in the Liberal Arts Building, in the photographs section adjacent to the Eastman and Ansco displays. No other collection of photographs give a better conception of the rugged beauty of California.

The bureau of franchises of the Board of Estimate and Apportionment for New York City has issued a 184-page report for the year 1914. It reviews all the franchise decisions made by the board for the year and gives the present status of all unsettled questions for street railways and other utilities within the city. It also contains an appendix giving the report of the bureau of franchises to the franchise committee on the form of a motor bus franchise and proposed routes in the Borough of Manhattan, as well as the proposed draft itself of the motor bus franchise.

From Traffic Study to Time-table

In This Concluding Article Methods Are Described and Illustrated for Constructing Schedules on the Basis of the Information Collected During the Study of Traffic

BY F. W. DOOLITTLE, DIRECTOR BUREAU OF FARE RESEARCH, AMERICAN ELECTRIC RAILWAY ASSOCIATION

The previous articles under the general head of traffic studies have dealt with the need for accurate knowledge concerning the distribution of traffic over the lines of an electric railway and have discussed the systematic and accidental variations in this traffic from hour to hour and from day to day. Something has been said as to the extent of the data to be gathered and the frequency of traffic surveys, together with reference to the departmental organization which should have charge of the work. The article in the ELECTRIC RAILWAY JOURNAL of Aug. 21 discussed the problem of fitting car-miles to passenger-miles in the light of the fact that rush-hour service is more expensive than service at other times during the day. The present and concluding article relates to the methods of constructing schedules based on the information collected in the study of traffic.

On lines where traffic is light the determining factor in schedule making is, in most cases, the required minimum frequency of service. The headway may be prescribed by ordinance or may be adopted by the management as the minimum headway necessary to develop the traffic. On single-track lines as the amount of traffic increases the schedules are still controlled by a definite headway determined by the location of passing tracks

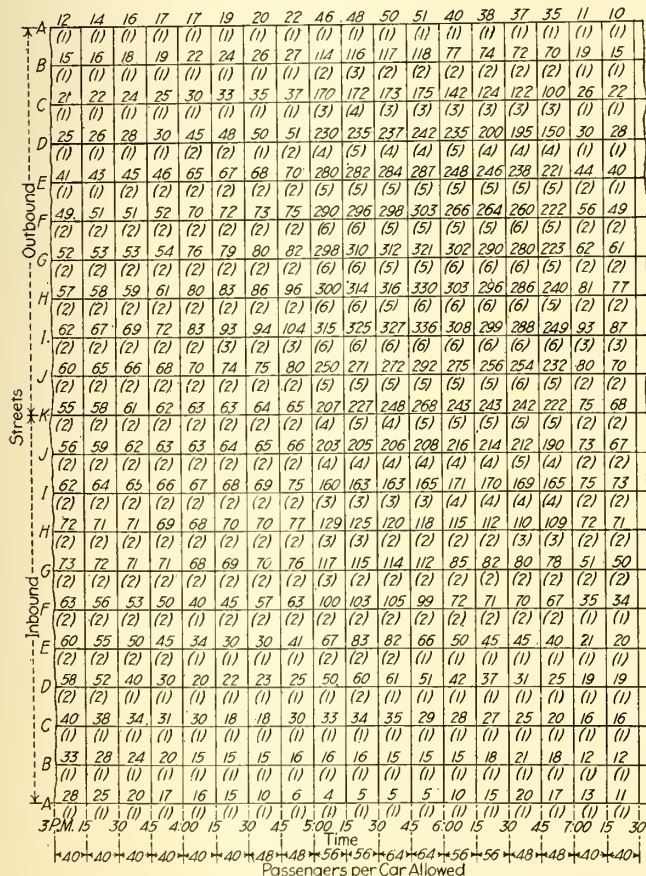

and intersections. To meet further increases in traffic trippers are run, which in effect increase the capacity of the regular cars but do not alter the headway materially. With double track lines, the schedules become more elastic but still tend to follow the form developed under single track operation. Eventually, with the growth of communities, the making of schedules outgrows the rules of practice inherited from simpler conditions, and, as has been previously pointed out, there arises the necessity for traffic studies as a means of fitting the service rendered to the demand for such service.

On lines of considerable traffic density, the starting point in schedule making is the determination of the number of cars required under existing service regulations to carry the passengers moving in the controlling direction and past controlling points on the line during the heavier fifteen or thirty-minute periods of the day. With these requirements determined, the next step of the process is the scheduling of the required cars for earlier and later periods, or until such a time as they are not required by traffic conditions. The cars must be scheduled back to the time when they must leave the carhouses and scheduled ahead until they can be returned to the carhouses.

The applications of traffic requirements, as measured in cars required to cars scheduled, are largely mechanical, but must be supplemented by certain adjustments made in the light of experience to permit of the practical operation of the schedule. A typical illustration, developing a schedule for a single line,* will explain the process. The illustration must be followed with important qualifications in mind. Schedule making is too complicated to lend itself to fixed or rigid rules. The location of carhouses, transfer points and traffic hazards are some of the factors that require judicious treatment in each case. The illustration deals only with general principles and only passing reference is made to certain complications encountered in a simplified application.

Assume as a typical case a line four miles long for which the traffic count has been made and for which the normal number of passengers passing a number of points during each fifteen minute of the day is accurately known.

Fig. 1 is a diagram representing, along the horizontal axis, the time of day, and along the vertical axis, distances. The horizontal lines indicate the street intersections at which traffic counts were taken, and the vertical lines divide the time into fifteen-minute periods. As originally drawn, this figure and the following ones included the entire twenty-four hours, but for larger scale and simplicity the diagrams reproduced have been abbreviated to include a few hours only. The larger numbers in Fig. 1 represent the number of passengers carried from each point during each fifteen-minute period, as determined by averaging a number of

CONSTRUCTING SCHEDULES—FIG. 1—DIAGRAM SHOWING PASSENGER TRAFFIC AT CHECKED STREETS AND NUMBER OF CARS REQUIRED BY STANDARDS FOR FIFTEEN-MINUTE PERIODS

*When cars on more than one route operate over the same track for a part of their journey, the case may be treated by considering the track used jointly as a separate line, or by dividing the local traffic over this part of the line between the two routes and then handling each route separately. Before decision is made as to the best method of handling such jointly operated track, it is well to examine the whole of each route separately to see if the controlling points do not occur elsewhere.

observations. The smaller numbers (those in parentheses) represent the number of cars required by the standards of service under which the company is operating. It will be noted from figures below the base line that the allowed number of passengers per car varies, the assumed service standards permitting an average of sixty-four passengers in a car seating forty-four during the rush hour, and an average of only forty passengers through the middle of the day or non-rush period. The standard permits a gradual adjustment of service to traffic during the periods preceding and following the time of maximum loading. The numbers representing the cars required in each fifteen-minute period were determined by dividing the corresponding numbers by the allowable number of passengers per car.

Fig. 2 shows in diagonal lines the second step in determining the service to be furnished. The figures inset in the horizontal lines correspond to the number of cars required under the service standards as shown in Fig. 1. The figures at the ends of diagonal lines represent runs, and when the run number is inclosed

by a circle the run begins or terminates at that time. The dotted lines represent cars run under the assumed requirements that the maximum headway on this line shall be fifteen minutes. Cross-overs are located at Streets D and I and are used to short-route cars in either direction. From Fig. 1 it is evident that five additional cars must pass Streets I, H and G during each fifteen minutes from 5 to 5.30 p. m., and these are therefore indicated in Fig. 2. The construction of the schedule is begun at this point, it being here that the maximum traffic demand is found. These cars are scheduled before and after this time to the point at which they are no longer needed and can be returned to the carhouses, which have been assumed to be located at Street A. Cars are short-routed at Streets D and I wherever possible, thus permitting the minimum mileage* for the service rendered. Short-routing occurs chiefly at Street D both in the morning and in the evening, but also at Street I during the morning rush hours.

In drawing Fig. 2 an average speed of 8 m.p.h., including lay-over, was assumed as the result of experience. Speed will be different over different parts of the run, and this variation will next be taken into account. Observation and experience, it will be assumed, have indicated that while the run from Street A to Street K and return, 2 miles, can be made in one hour, the average speed between Streets A and D will be 11 m.p.h.; between Streets D and I, 9 m.p.h., and between Streets I and K, 6.5 m.p.h.† The straight diagonal lines of Fig. 2 will then have to be warped and time points and the final schedule subsequently determined. Fig. 3 indicates how the average speed of 8 m.p.h. is obtained under typical conditions. The schedule thus devised is based on traffic requirements, but modified to take into account possibilities of short-routing, ordinance re-

*It must be borne in mind, of course, that the minimum mileage here indicated cannot generally be realized completely, as it is unwise to ask passengers to transfer to the car following in all cases where that car normally would have room for them. Some consideration must be given to diversity of traffic, in addition to the consideration already given to this factor in fixing the off-peak capacity of cars at less than the number of seats.

†Variation in speed from hour to hour during the day will necessitate the use of several average and several specific speeds to complete other parts of the schedule.

CONSTRUCTING SCHEDULES—FIG. 2—DIAGRAM SHOWING NUMBER OF CARS REQUIRED AND NUMBER ACTUALLY OPERATED DURING FIFTEEN-MINUTE PERIODS OVER DIFFERENT PARTS OF ROUTE

CONSTRUCTING SCHEDULES—FIG. 3—DIAGRAM SHOWING HOW AVERAGE SCHEDULE SPEED IS OBTAINED

CONSTRUCTING SCHEDULES—FIG. 4—DIAGRAM SHOWING IN MORE COMMON WAY PART OF GRAPHIC SCHEDULE OF FIG. 2, ADJUSTED TO MEET OPERATING CONDITIONS

quirements as to headway, location of carhouses and variable speeds throughout different parts of the route.†

Fig. 4 corresponds to a portion of the graphic schedule shown in Fig. 2 adjusted to meet operating conditions. In Fig. 1 and Fig. 2 the movement of a car from Street A to Street K and return to Street A is indicated by a line passing from the bottom to the top of the figure, these extreme lines representing the same street. Fig. 4 is of the type more generally used to represent schedules. In it in-bound cars are indicated by lines sloping upward to the right, while out-bound cars are represented by lines sloping downward to the right. Although Fig. 4 is the more common form, on account of the difficulty of showing thereon the number of cars required in two directions and the confusion resulting from the many intersections of lines the form used in Fig. 1 and Fig. 2 appears to be preferable for preliminary work. Time-tables of the usual types can now be taken off without difficulty, and from the graphic chart the trainmaster can at all times determine the location of all equipment in service and can see most readily the possibilities of expansion and contraction of service as traffic requirements vary.

No attempt has been made to indicate assignment of crews, as this will depend upon agreements in effect locally as to hours of service and as to the relation between "lay-over" and "running" time. The illustration shows the more important practical application of the traffic study, although it should be remembered that in addition to the construction of time-tables the traffic study serves as the basis for rerouteing of cars, adjusting transfer points and solving similar problems.

†A very complete analysis of these factors and others which make necessary in particular cases a departure from a schedule conforming precisely to the occurrence of traffic, as determined by check, is contained in a paper read before the Public Service Railway Section of the American Electric Railway Association on April 16, 1914, by Alexander Jackson, head of the time-table department of the Public Service Railway, Newark, N. J. (ELECTRIC RAILWAY JOURNAL, April 18, 1914). Such factors as make it necessary to vary from the service indicated by a traffic count are encountered in any scheme of schedule construction and are not to be considered as discounting the value of the traffic study, but rather as emphasizing its value by fixing definitely the required service and avoiding the possibility of adjusting the service away from rather than in accordance with the requirements of the traffic.

Attractive Shelter at Glasgow

The accompanying engraving shows a very attractive waiting room and shelter recently erected for passengers at the corner of Grange Road and Battlefield Road, Glasgow, Scotland, an important junction point for the tramways in that city. After the decision that a shelter of this kind should be erected, an advertisement was published for competitive designs. Twenty-nine designs were received, and finally the one submitted by Frank Burnet of Boston was accepted.

The waiting room, which occupies the center or main portion of the building, is 45 ft. x 25 ft. Lavatory accommodation is provided at the north end of the building, and the south end is fitted up with a neat and attractive newspaper and confectioner's shop, surmounted by an octagonal tower with a gilt dome. The exterior walls are faced with Doulton's carrara wear. The roof is finished with red tile, and the woodwork is of red pine throughout. The cost, approximately, was £1,800 or about \$8,460.

VIEW OF NEW WAITING STATION IN GLASGOW

Autos and the Electric Car*

A Discussion from the Standpoint of the Public of the Advantages to the User and to the Community of Automobiles and Street Cars

BY JOHN A. BEELER, VICE-PRESIDENT AND GENERAL MANAGER DENVER TRAMWAY COMPANY

The results of the street traffic count and survey recently compiled by the Denver Tramway Company¹ disclosed many features which we believe are of interest to the company's patrons and the public generally. The most salient features of Denver's local transportation situation are briefly set forth, together with estimates of comparative cost of auto and street car service.

PASSENGER MOVEMENT.

After eliminating all traffic in connection with freight and merchandise deliveries, the total volume of passenger traffic, including pedestrians, counting each person in or out of the business section as one, then adding to this the total number of passengers carried by the tramway company within the city on this day was, in even figures:

	Persons	Per Cent
In tramway cars	184,000	51
Pedestrians	103,000	28
In passenger autos	47,000	13
On bicycles	21,000	6
In horse-drawn vehicles	4,000	1
On motorcycles	4,000	1
Total	363,000	100

Compared with a similar count taken in May last year, the startling feature is that the number of passengers carried by the auto has increased 50 per cent during the year, while the number of street car patrons has diminished 9 per cent. Other movements showed comparatively very little change, bicycle and motorcycle increasing slightly, while horses and pedestrians decreased.

NUMBER OF AUTOS AND THEIR COST

The number of passenger auto licenses for use in Denver on Jan. 1, 1915, was 5580, or a total of 6120 including dealers' licenses and trucks. The total in the State was 18,433 and in the United States 1,755,000. This is an average of one auto for every thirty-six people in the city, one for every forty-five in Colorado, and one for every fifty-two in the United States.

The average cost new of each passenger auto in the United States for the last year was approximately \$1,000. At this rate, the 5580 passenger machines in Denver cost \$5,580,000. Interest at 6 per cent and depreciation based on an average life of eight years, totaling 18 per cent, equals in round figures \$1,000,000. (The figures used here in are based upon the average of all autos in Denver last year.)

Assuming that the average maintenance and operating expense of each machine, including gasoline, tires, repairs, garage and other expenses, for city service averages \$1 per day per car, the total annual operating expense for the machines in Denver equals \$2,000,000. This, added to the \$1,000,000 interest and depreciation cited above, gives a total annual outlay of practically \$3,000,000 for Denver's passenger autos.

As shown by the traffic survey, 13 per cent of the total daily traffic is by autos, which is equivalent to about 18,000,000 passengers per annum. This, divided into the \$3,000,000 expense, would indicate that each one-way trip averaged about 17 cents per passenger.

Assuming that each auto will make annually about 5000 miles in city service (or nearly 14 miles daily), a total of 28,000,000 miles is the annual result. This, divided into the total annual cost of \$3,000,000, results in a cost of about 11 cents per mile (7½ cents for tires, gasoline, repairs and other operating expenses and 3½ cents for interest and depreciation).

Each of the 5580 cars was found to average two round trips daily. This, for 365 days, results in 4,000,000 round trips annually. Divided into 28,000,000 miles, it indicates that the average length of each round trip was 7 miles, or 3½ miles for each one-way trip, against 4.82 miles for each one-way trip on tramway cars. At 11 cents per auto-mile, the cost of the 3½-mile one-way trip equals 38 cents, or 19 cents per passenger per trip, which tallies closely with the estimate of 17 cents.

TRAMWAY PERFORMANCE

During the past year the tramway company carried 75,000,000 passengers on its city lines, for which it received a revenue of approximately \$3,000,000, or about 4 cents per passenger per trip, or less than one-quarter of the cost per each auto passenger per trip. Or the tramway, at a total cost to its patrons of \$3,000,000, transported 75,000,000, while the auto at a like total cost transported but 18,000,000 people.

Had there been no autos, and had these 18,000,000 passengers availed themselves of the tramway company's transportation facilities, the total cost to them would have been about \$700,000 instead of \$3,000,000, thereby effecting an economic saving to the community of \$2,300,000, or nearly \$400 each to the 5580 auto owners.

Four hundred dollars is a considerable annual outlay to most families, and even with the more general use of cheaper and lighter machines and a reduction of this amount by 25 per cent, or even 50 per cent, the required annual outlay for a machine should deter many from investing in an auto, especially if living in a community where good street car facilities are maintained.

The tramway plant and equipment is sufficient not only to move the entire population daily but to care for large crowds of strangers, big conventions, etc. If the auto were to supplant the street car, to take care of the entire population of Denver would require about eight times as many, or from 45,000 to 50,000 machines.

A "GIFT HORSE"

The auto owner who picks up a stranger waiting for a street car and transports him, gratis, to or from the residence section, may labor under the delusion that he is a good fellow and doing a kindly act. Possibly he knows that each pound of weight added to his machine increases his expense for gasoline, tires, etc., but does he realize that he is doing both himself and his neighborhood an injustice?

The apparent favor is in fact no favor at all, but a detriment to all concerned, for the reason that the street railway operates its cars on schedules adjusted to care for the volume of traffic on the various lines in order properly to serve the different localities. Reduced patronage eventually results in reduced car service. This is the economic sequence; otherwise, the company operating upon the narrow margin it does, could not continue to exist.

*Abstract, from advance copy, of article prepared for general circulation in Denver.

¹See ELECTRIC RAILWAY JOURNAL, Aug. 21, 1915, page 309.

With reduced car service, lower realty values follow, and increased difficulty in obtaining help and servants in the home is experienced. Therefore, the injury is not confined to the local transportation company but extends to the community generally.

With the continued increase in the use of the auto, many new problems will have to be met. The capacity of the streets may be reached. The wear and tear on the pavements will be greater than ever. More money will be required for their upkeep. The burden of the cost of construction and maintaining paving, viaducts, and other public improvements heretofore largely borne by the street railways, will of necessity have to be partially or wholly shifted to some other source, or provided for by general taxation.

SCORE FOR THE BUZZ-WAGON

The advantages claimed for the auto are:

1. Time waiting for car is saved.
2. Conveys one direct from home to office, avoiding the necessity of a walk to and from car line.
3. Intermediate stops are unnecessary, thus saving time.
4. Operation at higher speed, even though it may be contrary to law.
5. Can avail itself of most direct route and reach places remote from car lines.
6. Is more exclusive.

THE STREET CAR HAS A FEW GOOD POINTS

Some of the advantages claimed for the automobile and mentioned above are good ones; others are more apparent than real, especially when all the advantages of a first-class street car system are considered with reference to both the individual and the community as a whole. Those for the car are:

1. The more substantial car insures greater safety, there being fewer accidents to patrons and less danger to pedestrians.
2. Cheaper by about 1 to 4, or 75 cents out of each \$1 saved.
3. It is always on the job, rain or shine, snow or mud.
4. Continuous service is furnished for at least eighteen hours daily. Therefore, it is not necessary for all members of the family to go at the same time.
5. Reduces congestion. One street car is capable of handling from ten to twelve times the capacity of an auto.
6. Patrons are relieved of all responsibility for the operation of the car, the trainmen shouldering that.
7. No road troubles, blow-outs, punctures, faulty spark plugs or broken connections to annoy the rider.
8. No time required for overhauling, cleaning and repairing car (which is a considerable item where one takes care of an auto). Tramway employees attend to that while you sleep.
9. Increased comfort, less dust in summer, warm stormproof cars in winter and inclement weather, and always smoother riding.
10. No joy riding or improper behavior.
11. The street car company wears out its own rails, not the pavement as the auto does, thus effecting a saving to the economical benefit of the community.
12. If you are late, you can always blame it on the tramway, but where is the man who will acknowledge that there is anything wrong with his buzz-wagon?

FORECAST AND THRIFT

The greatest future market for the auto will undoubtedly be for the low-priced, light-weight car, for use especially in the country districts. Assuming, however, that the day should come when every family has an auto, what would be the result? The modern family

does not all go at once. They usually, except on Sundays, holidays and special occasions, go one at a time. Therefore, those who figure that all the family car fare will be saved are doomed to disappointment. The increased number of autos and increased danger in the streets will tend to check their use within the more congested districts as time goes on.

The damage done to a machine by leaving it in the street in all kinds of weather is an item of considerable expense and can be likened to that resulting from the practice of the farmer who leaves machinery out in the open the year around, subject to destruction by the elements.

There are many instances where you can save money daily by leaving the auto in the garage and patronizing the tramway company, especially when going to and from the business district, whether it be to the store, office or theater.

DIVIDENDS TO PATRONS

By patronizing the street car, you render possible the only permanent and continuous means of transportation. The less patronage the less frequent the service. Therefore, if you will ride on the tramway whenever it will serve you equally as well as your automobile, you benefit your community, and at the same time save your own money.

The community that fails to render sufficient support to a street car company to enable it to render good transit facilities will in the end suffer as much from the curtailment or withdrawal of the service as the company.

The fact that every section of the city of Denver is served by the tramway has been one of the most important features in Denver's development. That this has been no small task is illustrated when Denver's area is compared with that of other cities. Denver stands nearer the head of the list as to area than it does to population. This has required more trackage, and consequently a larger outlay on the part of the tramway, than would have been necessary had the city been smaller and more compactly built. Following is a list of the principal cities in the United States, showing number of square miles of territory within their limits, with population as per census of 1910, and miles of street railway track per 1000 population. Denver has a mile for each 1000, while the average of the other cities is less than a half mile.

	Square Miles	Population	Miles of Track per 1000 Population
Greater New York	77	4,766,883	0.10
St. Louis	61	687,029	0.50
Washington, D. C.	60	331,069	0.47
Denver	58	213,381	1.00
San Francisco	46	416,912	0.50
Cincinnati	42	364,463	0.60
Buffalo	42	423,715	0.51
Pittsburgh	41	533,905	0.52
New Orleans	41	339,075	0.55
Cleveland	40	560,663	0.39
Boston	38	670,585	0.66
Detroit	36	465,766	0.43
Baltimore	30	558,485	0.40
Milwaukee	22	373,857	0.41

CROWDED CARS

When you see the cars crowded, remember that there are many times when trip after trip is made at different periods of the day and night when the conductor is a very lonesome individual. The company would be much better off if there was a steady, even travel, only sufficient to fill the seating capacity of the cars.

The handling of the rush-hour period in most cities is not only a vexatious problem, but a costly operation. Most people ride during the daily rush hours, of course. This problem has been successfully met in Denver by the employment of large, commodious trailers, seating

more than the motor car. Thus seats are provided for the great majority of patrons, even during this period. Standing idle all of the time except for a few hours daily service, these trailers are maintained in order to provide greater comfort to the traveling public.

SAFETY FIRST

The modern street car, operating upon substantial tracks, is yet by far the most economical, safe, reliable means of city transportation, and will undoubtedly continue so, but the quality of the service and the frequency of the headway are entirely dependent upon the patronage.

Both the management and the employees extend a most cordial invitation to all to make greater use of the tramway, thus making it possible to continue to improve the service. After all is said and done, the best way to help yourself is by first helping others.

COMMUNICATIONS

Girder and High T-Rail Renewals

TWIN CITY RAPID TRANSIT COMPANY
MINNEAPOLIS, MINN., Sept. 10, 1915.

To the Editors:

Referring to article on page 179 of the *ELECTRIC RAILWAY JOURNAL* of July 31, 1915, the wear or service that can be obtained from rail in the paved streets of our cities is an important matter for all street railways. This article is the best study of the subject the writer has seen. To decide when the rail on certain streets is worn out is a common problem for all maintenance engineers, and the article will be helpful in its solution.

While the construction of joints has been improved, the writer believes that it is still true that the condition of the joints is a large factor in deciding the remaining wear life of the rail. In the case of T-rail the maximum amount of wear that can be obtained theoretically will be when the rail is worn so far that it is no longer strong enough to sustain the weight of the cars. In practice the observation of the writer is that before this theoretical limit is reached generally some parts of the rail are worn, either from joint troubles, corrugation, flange wear, or defects that develop in the rail, so far that it is considered reasonable to renew it if the finances of the company will permit.

It often occurs that where track needs to be rehabilitated the rail is taken up, the ends cut off to remove poor and worn parts, after which it is relaid when the street surface is renewed, or in some instances, the old rail is relaid on lines in outlying districts with lighter traffic, if the company has such new track extensions where it may be used. Some companies find that taking up and relaying rail after cutting off the ends is entirely practical. In this way the theoretical amount of wear that can be obtained from the rail will be approximately reached. The wear of the rail head does not take place uniformly to a level line across the head, as shown on some of the diagrams, but to a sloping surface. Considerable wear usually takes place along the gage line that appears to be caused by irregularities developing in grade of rail or surface of track, by nosing of car trucks, difference of hardness at different spots in the rails and other reasons. Corrosion of web and base of rail may affect the life of rail, but in paved track it is the experience of the writer that this is not a determining factor.

The point is well made in the article under consideration that the question of pavement renewals will often decide the question of rail renewals. If a new and expensive pavement is to be constructed in the

place of a worn-out pavement, it will often be economy to renew the track even if the rail has several years of life remaining. To leave the old rail in place would, in many instances, hasten the deterioration of the adjoining pavement, and the expense of maintaining paving and track would be more than the saving in rail to obtain its extreme life. In this connection it must be also considered that public authorities are demanding a higher standard of track maintenance, especially in connection with new and expensive pavements.

The author's method of arriving at the annual charge of maintenance of old rail and annual cost of new rail is ingenious, but it will seldom occur that the time of renewal can be fixed by these mathematical considerations alone. Such information is of value to assist in making a decision as to renewals and is one of the conditions to be considered. The main factor in arriving at a decision will be the financial situation. When there is necessity for small expenditures, rail and track will be worn as long as possible. When finances will warrant and the company and public desire tracks and pavements to be kept in first-class order, rail renewals will be made sooner and the wear obtained will be less than the possible maximum indicated in the article.

Many companies, if financially able, put down new, expensive track, while the actual maximum life of the old rail has not been reached. The writer has seen many instances where good rail was removed from the track and scrapped, and new rail substituted. This change usually takes place when new pavements are constructed, and in fact it might be said that a very large part of the wear remaining in rails of street railway tracks when the rail has been scrapped, has been lost on account of the civic improvements and the desire of companies to comply with the request of public authorities that the tracks shall be renewed when new pavements are installed. The actual maximum life of the rail in connection with the modern and expensive type of track has not yet been determined.

GEORGE L. WILSON,
Engineer Maintenance of Way.

NEW YORK STATE RAILWAYS
SYRACUSE, N. Y., Sept. 2, 1915.

To the Editors:

I have read with much interest the article on "Girder and High T-Rail Renewals" in the issue of the *ELECTRIC RAILWAY JOURNAL* of July 31, 1915. The principal causes for rail renewals are clearly presented and a formula derived which should give results in many cases. There will be, of course, many instances where other considerations will enter the problem, such as city ordinances which will render any mathematical calculations of no real value.

I consider the assumption of an average life of thirty years for track in paved city streets of over 100,000 population to be entirely too high. Sixteen to twenty years would be nearer correct in small cities, and fifteen years in larger ones. The life of the rail, I believe, will ultimately be determined by that of the joint, and this will, of course, depend on how well the joint is maintained. It has been my experience with the older types of 9-in. and 7-in. girder rails that after fourteen or fifteen years' service under heavy traffic, even though the joints may still have considerable life left, or it is possible to cut off the ends to make new joints, the rails are generally surface bent and kinked so that a good paved track cannot be built. It might be possible on light traffic lines to obtain thirty years' life by maintaining the joints as long as possible, and when this no longer can be done because the rail ends have been ground thin on the head, the ends can be cut off

and new joints installed. I have done this on several light traffic streets but have not attempted it under heavy traffic.

To estimate the average life of rail for the next twenty years based on rails laid fifteen to twenty years ago is erroneous. In general, rails laid twenty years ago did not carry heavy double-truck cars until about ten years later, and the number of cars operated and speeds have also increased rapidly since then. I have observed track that was in almost perfect condition after ten years' operation with light single-truck cars practically fail after five years more service with heavy double-truck cars operated at a closer headway. Hence, in spite of improved rails and joints, I do not believe our modern rails will last any longer, if as long, as those laid fifteen years ago, due to the increasing weight, speeds and headways in our city streets. Moreover, municipal authorities are requiring a higher degree of paving maintenance than ever before. I believe that some of the older rails gave twenty years' service simply because the streets were not paved and maintenance consisted only in keeping the track safe for operation.

As regards the modern 7-in. T-rails now being so widely used, I believe that the life in paved streets will be determined by the joint and surface bending and not by the amount of metal worn off the head between joints. What has happened to a rail in the past ten years I do not believe can be used as a basis to determine, with any degree of accuracy, what will be its condition at the end of the next ten to twenty years, except, possibly, the amount of metal which will be worn off the head.

E. P. ROUNDEY,

Engineer Maintenance of Way.

The Vienna-Pressburg Electrification

VIENNA, AUSTRIA, July 31, 1915.

To the Editors:

I notice the author of a letter published in the Communications Department in your issue of May 22 refers to the 15,000-volt, single-phase overhead line of the Vienna-Pressburg Railway as apparently fitted with the Fischer-Jellinek suspension. This is incorrect, but the writer is correct in stating that this form of suspension involves wear of the trolley wire at the clamps. I would refer you to the extended statement in Nos. 32, 33 and 34 of the 1914 issue of *Elektrische Kraftbetriebe und Bahnen* and to my article entitled "Ueber Hochspannungs-Leitungsanlagen für Bahnen" (Concerning High-Tension Transmission Systems for Railways) published in Nos. 8 and 9 of the *Electrotechnische Zeitschrift*, Berlin. These show the feature of the A. E. G.-Union-Vienna systems is to secure theoretically correct regulation without the defects of the Fischer-Jellinek suspension mentioned.

I must deny absolutely, however, that it is indifferent whether the trolley wire hangs in a series of festoons or whether it is carried as close to a perfect horizontal plane as possible. The long life of the bows on the Vienna-Pressburg Railway, up to 42,000 locomotive-kilometers, proves that the best results are obtained with the trolley wire in a horizontal plane.

I also notice the letter from W. K. Archbold in the same issue of your paper and would be glad to become better acquainted with the Northern Ohio Traction & Light Railway's system, as mentioned by him.

The triangular arrangement of the A. E. G.-Union system has the advantage that it permits no pulling or pressing out from its proper position of the working conductor, a condition which is unavoidable where vertical hangers are used.

The tower construction used on the Vienna-Pressburg

Railway is in accordance with the calculations and factors of safety required by the Austrian Railway ministry, and they offer ample safety.

DR. ING. E. E. SEEFEHLNER,

Director A. E. G.-Union Elektrizitäts Gesellschaft.

Permissible Difference in Wheel Diameter

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
EAST PITTSBURGH, PA., Sept. 13, 1915.

To the Editors:

Supplementing my article which appeared on page 452 of the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 11, the following statements may be of interest.

In any given case the permissible difference in car-wheel diameter depends upon a number of factors. Several of these are as follows:

1. The margin in temperature rise which the motors have, if all the motors divide the load equally. If the motors are running quite cool a certain difference in heating is not so objectionable as when the motors are running hot.

2. The relative number of motors on the car with the large and small wheels. If a car has three motors with large wheels and one with smaller wheels, the condition is not as serious as though the car was equipped with three small sets of wheels and one larger set.

3. The speed at which the car operates most of the time. If the service is such that the motor operates much of the time at heavy loads, the difference in wheel diameters permissible will not be as great as though the motors were in service where most of the running is at high speed.

4. These curves are based on the assumption that the motors have identically the same speed curves but in commercial production due to variation of materials, machinery, etc., the speeds of different motors may vary as much as 5 per cent. If the motor which is mounted on the larger wheel rotates at higher speed for the same amperes than the motor on the smaller wheel the difference in loading and heating will be in excess of that given by the curves.

Figs. 2 and 3 reproduced with the article will be found useful in arriving at a solution.

A. L. BROOMALL,

Railway Engineering Department.

Picnic Park as Traffic Accelerator

In spite of the cool summer the Louisville & Northern Railway & Lighting Company, New Albany, Ind., which operates Glenwood Park, near New Albany, reports excellent success with the property. The annual Chautauqua brought out large crowds, while other special events have proved successful in developing traffic. Louisville people have been educated to use Glenwood Park for picnic purposes. On Labor Day an especially large picnic was held, and on the following day a musical event out of the ordinary drew several thousand people.

The success of the park, as a traffic proposition, is indicated by the fact that while many of the regular amusement resorts in the Louisville district closed late in August, Glenwood was expected to close on Sept. 15.

A company in Cuba, reported as the Oriente Fruit Company, according to unconfirmed information is said to be considering plans for the construction of a 20-mile heavily graded electric railway in Cuba for the transportation of bananas and coffee, the motor equipment to be of the three-phase induction type. Inquiries for certain accessory car equipment for 253 cars have been received in New York City.

ANNUAL CONVENTION
SAN FRANCISCO

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

Additional List of Reservations for the "Red Special"—Change in Los Angeles Program of Entertainment—
Award in Accountants' Course—Manila Company Section

THE "RED SPECIAL"

H. G. McConaughy, director of transportation of the American Electric Railway Manufacturers' Association, reports that the "Red Special" train, which will leave New York on Sept. 23 for the San Francisco convention, is now oversubscribed. There will be twelve cars in the train and it will weigh more than 1000 tons. Two cars will come from Boston, one car from Cleveland and one car from Chicago. The other cars will leave from New York. The train will be made up of all standard steel Pullman equipment, all sleeping cars being stateroom and drawing-room cars only.

The following are some of the additional reservations for the train, made since the publication of the list in the issue of Sept. 4.

Miss Annie R. Almy	John M. High, Jr.	Miss F. E. Stanley
F. W. Coen	Miss Florence Hedley	Miss B. Tompkins
J. J. Dempsey	C. B. Keyes	H. R. Trainer
Mrs. Dempsey	T. P. Kilfoyle	Mrs. Trainer
C. R. Ellicott	J. C. McQuiston	W. S. Twining
A. H. Ford	W. B. Potter	Charles S. Waring
Mrs. Ford	Mrs. Potter	Mrs. Waring
W. G. Gove	E. O. Shyrock	Miss Edith Waring
Mrs. Gove	John J. Stanley	T. Walley Williams
Mrs. John M. High	Mrs. Stanley	

CHANGE IN LOS ANGELES PROGRAM OF ENTERTAINMENT

Owing to the fact that the special train will arrive at San Fernando at 9.30 a. m. on Tuesday, Oct. 12, instead of on Oct. 13, as expected by the committee, a slight change has been made in the program of entertainment at Los Angeles from that mentioned on page 446 of the issue of last week. In consequence, Transportation Day at Universal City will be Tuesday, Oct. 12, and Catalina Day on Santa Catalina Island will be Wednesday, Oct. 13. Oct. 14 will be an open date at Los Angeles so far as the morning is concerned, giving the members and their families an opportunity to visit any special places of interest in the city, which they will leave at 3 p. m. for San Diego. The San Diego days will be Friday, Oct. 15, and Saturday, Oct. 16, and the party will leave San Diego at 1 a. m. on Sunday, Oct. 17, for Riverside.

AWARD IN ACCOUNTANTS' COURSE

As announced last year provision was made in planning the educational course of the Accountants' Association for the awarding of a prize of \$50 for the best paper on the eighth lecture submitted to the instructor, Prof. J. R. Wildman. This award will be made at the Monday (Oct. 4) session of the Accountants' Association at the convention, immediately following the presentation of the report of the committee on education by George G. Whitney.

The fortunate recipient of the \$50 in gold will be E. C. Stothart, auditor Charleston Consolidated Light & Power Company, Charleston, S. C. First honorable mention will be accorded to Albert L. Good, civil engineer Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., and second honorable mention to H. F. Van Wye, clerk American Railways, Philadelphia, Pa. The announcement of this award will be a reminder to those who have not yet registered for the 1915-1916 courses.

MANILA COMPANY SECTION

The eighth monthly meeting of joint company section No. 5 was held in Manila on Aug. 3. H. P. L. Jollye, assistant auditor Manila Electric Railroad & Light Company, spoke on "The Essentials of Fare and Bill Collecting." Most of the discussion centered in the second part of the topic.

Mr. Jollye said that the conditions in connection with fare collection in Manila are quite different from those of other countries as there are nineteen grades of cash fares, ten first-class and nine second-class, ranging from a scholar's ticket of 2½ cents on the suburban line to the first-class cash fare of 12 cents. In addition there are first-class and second-class complimentary employee's tickets. For a street railway with 52 miles of track this produces accounting complications. Both the old type and the pay-as-you-enter type of cars are used, and the latter is preferred as giving the most accurate check upon conductors, with less opportunity for conductors or passengers to defraud the company.

After quoting at length from the report of the 1913 committee of the association on fares and transfers, to show the unsettled condition of the fare collection situation, Mr. Jollye emphasized the importance of the conductor in determining the success of any system, as follows: "The conductor is the representative of the company, the one who comes in contact with the public more than all others, and by him and his conduct toward the public will the company be largely judged. A conductor must be a man courteous by nature, with the patience of Job, always ready to assist the passengers in any difficulty, to be able to firmly but politely refuse a transfer a week old, or a scholar's ticket from a man in his second childhood. During the busy hours of the day he has to work at high speed and any mistakes he makes he has to pay for, and all this time he gets little consideration from the public and is expected to give much."

Purpose of American Association of Engineers Outlined

At a booster dinner of the American Association of Engineers, an organization drawing members from all branches of the engineering profession, Prof. F. H. Newell, head of the department of civil engineering at the University of Illinois, outlined the purpose of the new association. The organization is designed to promote the interest of the average engineer by affording means for the interchange of information, maintaining a service clearing house, furnishing advice on patent and legal matters and supervising legislation by proper publicity.

A national convention of this association is to be held at the La Salle Hotel, Chicago, on Dec. 10 and 11, 1915. The offices of the association are at Room 1056, 29 South La Salle Street, Chicago, Ill.

Promoters of the extensive club grounds, amusement park and speedway plans for Overland Park, on the Kansas City-Olathe Electric Railway are urging upon federal officials the designation of Overland Park as the site for a military aviation station. Aviation exhibitions are held at Overland Park now each Sunday.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

New Method to Determine Railway Motor Speeds with Varying Voltage

BY A. M. BUCK, ASSISTANT PROFESSOR OF RAILWAY ELECTRICAL ENGINEERING, UNIVERSITY OF ILLINOIS

It is frequently desirable to obtain characteristics of railway motors when operating under abnormal conditions, as, for example, when a certain amount of resistance is inserted in the circuit, or when the motors are working at pressures differing from the standard. A method by which the desired characteristics can be found from the normal performance curves furnished by the manufacturer is of considerable value in the engineering department of any railway company, even though it be only a moderate-sized road.

One way of getting the performance of the series motor under varying conditions has been suggested by F. Castiglioni, in an article in the *ELECTRIC RAILWAY JOURNAL* for March 13, 1915, page 515. His method, in brief, consists in using the well-known relation

$$\frac{S_2}{S_1} = \frac{E_2 - Ir}{E_1 - Ir} \quad (1)$$

to plot a series of charts giving the relation between S_1 and S_2 for a large number of values of terminal potential, currents and motor resistances. It is evident that any such chart becomes quite complicated if it is to cover more than a limited range of conditions.

In the issue of Feb. 13, 1915, the writer presented an article on the determination of railway motor resistances, giving a volt-ampere diagram for facilitating the calculation. This same chart can be used, with a slight modification, for finding the speed under abnormal conditions of potential and resistance in the motor circuit, so that it makes available a simple graphical method for computing motor speeds under nearly all variations which are liable to be met with in practice.

In order to make this clear, the portion of the diagram referred to is reproduced in Fig. 1, to show the relation between the current and the Ir drop in a motor under ordinary conditions of service. Inspection of the figure will show that the total pressure at the terminals is divided into two parts, the counter-emf. and the Ir drop. The sum of these two must always be equal to

the constant terminal voltage. Suppose that the line pressure is changed to some abnormal value, as to one-half (for example, when two motors of an equipment are placed in series). This alters the terminal voltage, but, as shown in the figure, does not affect the Ir drop. The ratio between the two values of counter-emf. is likewise the ratio between the two speeds. If, then, we can get a graphical method of establishing a proportion between the two quantities, the speed under the abnormal conditions can be found directly.

One arrangement for doing this is given in Fig. 2. At the right is shown the volt-ampere diagram of Fig. 1, and beside it is drawn the speed curve for the motor, as determined from test, the axes of abscissae being in the same line. The current scales need not, however, bear any definite relation to each other. Consider the speed S_1 of the motor at the terminal pressure E_1 . It is desired to find the speed S_2 at the same value of current. Through A , corresponding to this current on the right-hand scale, and through S_1 draw a straight line cutting the axis of abscissae at K . From K draw the line KB , intersecting the current value on the speed diagram at S_2 . This locates a point on the new speed curve corresponding to the current I . This must be true since, by similar triangles,

$$\frac{IS_1}{IS_2} = \frac{AI'}{BI'} \quad (2)$$

It has already been shown that AI' and BI' are the values of counter-emf. for the corresponding pressures E_1 and E_2 respectively.

The diagram is equally good if it is necessary to find the performance with external resistance in the circuit. The only change is to locate the correct slope for the Ir line at the proper terminal pressure and use intercepts on this for drawing the lines as AS_1K .

It is, perhaps, unnecessary to state that a different point K is located for each value of current.

In some cases it is convenient to make the construction complete on the speed-current curve itself. This is shown in Fig. 3. Here the volt-ampere diagram is drawn to the same scale as the speed curve, and the proportion is obtained by swinging one of the values of counter-emf. through an angle of 90 deg., that is,

RAILWAY MOTOR SPEEDS—FIG. 1, DIVISION OF VOLTAGE BETWEEN COUNTER-EMF. AND Ir DROP; FIGS. 2 AND 3, NEW GRAPHICAL METHOD OF SPEED CALCULATIONS

$OP = E_1$. The intersection of the two projections of counter-emf. will be at some point, such as P , and a line connecting this with the origin will divide the ordinate and abscissa at any place along it proportionally to them. If then the speed at E_1 volts is projected on this line, the speed at E_2 volts will be given by the corresponding co-ordinate, and may be swung back through 90 deg. to be plotted on the original scale. This is, of course, simply a geometrical device for locating S_2 so that $S_2:S_1 = E_1:E_2$.

An inspection of the diagram shows that the values of P for all possible values of current will lie along the line MN , which makes an angle of 45 deg. with the axes. This relation must be correct, since the Ir drop is the same, no matter what the terminal pressure. It is, therefore, unnecessary to swing the values of counter-emf. through 90 deg. to locate the points P . Draw the line MN through the intersection of the lines corresponding respectively to E_1 and E_2 at zero current (i.e., without any Ir drop). The projection of the Ir drop line on MN will then give the point of intersection P without going through the preliminary construction.

In case the performance must be found when an external resistance is inserted, the slopes of the two Ir lines will not be the same and the line MN will be at a different angle. Since the drops are proportional in the two cases this will merely mean the determination of the proper slope of the straight line MN after which the procedure is as before.

The principal advantage of these methods of calculating speeds under abnormal conditions is that they are so simple that there is little chance of making an error in the computation; and, since the construction can be repeated for any desired conditions, the application is not limited to a comparatively few cases for which charts have been figured out. It is believed that they will be of considerable aid in the solution of such problems.

The two methods of calculating speeds graphically were worked out independently, the one shown in Fig. 3 by the author, and that in Fig. 2 by S. Sekine, a graduate student at the university, working under the writer's direction.

Turntable for Painting Car Sash

BY R. E. HEWITT, MASTER MECHANIC SOUTHERN PACIFIC COMPANY ELECTRIC LINES, WEST ALAMEDA, CAL.

The scheme illustrated in the accompanying halftone was devised by an old practical painter in the employ of the Southern Pacific Company. In order to facilitate the painting of sash two turntables are located on the main table, making it possible to work two men at sash painting when necessary.

TABLE WITH TWO TURNTABLES FOR PAINTING SASH

The sash is laid on the top of the turntable and turned around until all four sides are painted, then it is turned over and the other side is painted. Directly behind the painter is a cabinet for storing the sash until dry. It will also be noted in the illustration that there are beveled strips nailed fast to the partitions of the cabinet parallel to one another. This method of support makes it possible to slide the painted sash in with the extreme edges of the latter only touching the strips.

The tops of the turntables are 12 in. square and faced with $\frac{1}{4}$ -in. felt, glued on. The openings in the top of the main table through which the shafts of the turntables pass are bushed with pipe of suitable diameter. Should the main table be required for any other work the turntables can be removed by simply lifting them out.

Timekeeping and Cost Records for Way Department

BY S. GAUSMANN, BROOKLYN, N. Y.

Too much care cannot be exercised in the selection of timekeepers for the maintenance of way department, and the payment of a sufficient wage to them to guarantee their honesty. With the class of men generally employed in gangs, if the timekeeper is paid insufficiently for his services he will endeavor to make a little extra when the opportunity so easily presents itself. This opportunity is afforded in many ways and no matter what the system loopholes will occur.

The only remedy is in checking the men from independent sources and by involving as many in the checking of their time as possible, all such checks being entirely separated from each other. The more checkers involved the less the chance of making a questionable transaction.

While the introduction of time clocks has done much to correct abuses of this kind where men are continually employed, or start and end the day's work at the same time, the use of clocks in track gangs is impracticable on account of the quantity required, their liability to injury outdoors, the frequent shifting of gangs, and the expense of maintaining clocks owing to impossibility of obtaining suitable locations and the rough handling they would receive.

The practice of having a foreman check the time of his gang, except in the case of small section gangs, should not be considered, as it takes too much of his time, diverts his mind from his regular work and is unsuitable for the average foreman, who, although he may be a first-class man in his chosen vocation, is not adapted for clerical work.

More territory is usually assigned to a timekeeper than he can properly cover. While he should check his men at least twice a day he is often unable to do so more than once under these conditions. This might do for regular work and with gangs in which no changes occur, but it will not do for the usual large construction or reconstruction gangs, where a different class of men are employed and are changing daily. A timekeeper should not be expected to keep the time of more than 200 men unless the gangs are close together, where too much time is not employed in traveling from one to the other. One general timekeeper should be employed who has jurisdiction over all the others and who should check the gangs, but intermittently, varying his routes daily so that the other timekeepers and men will never know just when he may appear. Timekeepers should not be expected to do too much clerical work. Keeping a timekeeper on one route continuously breeds too much familiarity. These routes should be varied, the oftener the better, so that every man employed would

INSTRUCTIONS											
This card to be punched by foreman for starting and stopping time and by timekeepers, when checking, daily. Time must be filled in by Employee for each day, as well as total time for week, with rate and total amount due and turned over to Paymaster on pay day.											

(BACK)

SAMPLE PAY CHECK FOR WAY DEPARTMENT EMPLOYEES

be checked by every timekeeper at some time throughout the week.

While the brass check system, much in vogue, is simple, it is very unsatisfactory. Without some further check, it is not at all certain that the timekeeper visits the work as expected. A card check system, where too much information is desired on the time card, to cover distribution of labor, etc., requires that a clerk be made of the timekeeper, and takes much of his time on work not entirely in keeping with his intended duties. If he is kept at timekeeping as long as he should be he will be employed at this other work long after hours, he will consequently be dissatisfied and, regardless of accuracy, will get through with it as soon as possible.

The use of daily individual time cards serves no purpose whatever, but necessitates the employment of an unnecessary clerical force to prepare the cards and distribute thereon the account numbers to which the various classes of work are charged, to say nothing of the number of cards required when there are 500 to 1500 or more employees.

Timekeeping and the distribution of labor and cost records should be kept separately and in such a manner as to be a mutual check on each class of work. In the larger gangs a checker should be employed continuously in each gang, working with the foreman and independent of the timekeepers, and rendering each day a report, to be described later, which should be checked against time turned in by timekeepers. These reports should be taken care of by foremen in the smaller gangs, assisted by a checker who should cover several of these gangs instead of being kept with one, as in the case of the larger construction or reconstruction gangs. Any clerical work in connection therewith should be done by a clerk in the office, thereby leaving the timekeeper to take care of timekeeping only.

The pay card furnished the men should be of a different color for each week of the month to facilitate the work of paymasters and so arranged that it will show the time of the daily checks of the timekeeper by punch marks with a verifying punch mark of the foreman for the starting and stopping time. All these

punches should be of a different character so that the user could be easily identified. The card should have a space for the total hours each day and should be turned in to the paymaster, with extensions filled out by the employee, when pay is drawn.

A card suitable for this purpose is illustrated herewith, on which the sequence of the days of the week can be changed to conform to the payroll week of any company. The "D" and "N" shown are to be punched out to indicate the period the man worked, whether day or night. The instructions on the back should be printed in both English and Italian, or such other language as is most generally spoken by the men employed.

The timekeeper should distribute these pay cards on the first day of the week to all men working, thereafter using them for identification only, and entering time daily in his own time book. On the last day of the week he should verify the total time as punched on the cards and turn in his book with the total time entered for the purpose of making up the payroll.

While this system would permit the men to know the amount of time turned in each day by the timekeeper, which is objected to by some companies, it would prevent many errors in keeping the time and would more easily verify any claim for shortage, as well as prevent any overpayment. Otherwise whenever the ordinary laborer is supposed to state the amount of time worked by him without any verification by the timekeeper he will invariably ask for more time than he is entitled to, and a considerable amount is lost to the company in this manner.

The question as to who should have jurisdiction over timekeepers and timekeeping is one worthy of discussion, as there is no doubt a diversity of opinion on this subject, but the most reasonable solution is that the auditing department should assume all responsibility for the proper taking of the time, the making up of the payrolls, the checking on the work and obtaining of unit data, as well as the distribution of the labor taken care of by representatives under the head of the way department. This method clearly defines the work of each and furnishes the independent check required without providing useless data for one department which is of value to the other.

While this method may have some disadvantages these are reduced to a minimum if each department will keep in touch with the other so that the correct locations of all gangs will be known, otherwise much confusion and inaccuracy in payrolls will soon result.

While many may believe that the head or sub-head of the way department should assume responsibility for timekeeping he should not be expected to do so unless he takes charge of it in its entirety. Much better results can be obtained by adopting the plan as suggested making the general timekeeper, with headquarters in the way department office, the representative of the auditing department.

Although unit labor costs for the various operations of track work are directly connected with the distribution of labor, still more information is required to make these units of any value, and where but one item will suffice in the distribution to cover an account number this will at times include as many as fifteen or more units for this one account. To expect a timekeeper to keep this, as well as the time, accurately is unreasonable. It is therefore advisable to have checkers, as previously mentioned. Since checkers are only required during the busy season good results are obtained by the use of young men from schools and colleges, who are of a class to take an interest in obtaining the results desired. These checkers render daily reports, which show the number of men employed on

SAMPLE WAY DEPARTMENT CHECKER'S REPORT

the work, the rate of pay of each, the hours put in at any particular class of work, with the total hours per day. While printed forms may be supplied for this purpose they cannot show all of the information desired without containing it on a large and bulky form, but the most frequent jobs can be shown, leaving blank columns for the others to be filled in as required.

Much better results, however, can be obtained by leaving the headings of all columns blank, to be filled in by the checker, the items either being designated by a full description or a number for each item desired, these numbers to be obtained from a key to be furnished each checker. A key of this character in any event is necessary, as hardly any two checkers would use the same description for a piece of work. They would often so word a description that it might apply to more than one class.

In obtaining unit costs there are practically six general divisions of labor to be considered; preparing, handling material, laying, concreting, paving and miscellaneous, which may be designated as 1, 2, 3, 4, 5 and 6 respectively. These may be subdivided under various units as follows:

1.—Preparing.	4.—Concreting.
1-A. Removing and loading old pavement.	4-A. Handling material to machine.
1-B. Excavating and loading dirt or concrete.	4-B. Mixing.
1-C. Removing and loading track material.	4-C. Placing in track.
1-D. Grading.	4-D. Ramming.
2.—Handling Material.	5.—Paving.
2-A. Loading and unloading new track material.	5-A. Handling material to pavers.
2-B. Loading and unloading new paving material.	5-B. Laying pavement.
2-C. Loading and unloading concrete material.	5-C. Mixing and placing rail filler.
2-D. Transportation of material to work.	5-D. Mixing and placing grout.
2-E. Transportation of material from work.	5-E. Tar and graveling.
3.—Laying.	6.—Miscellaneous.
3-A. Laying and spacing ties.	6-A. Corporation inspection.
3-B. Laying and spiking rail.	6-B. Miscellaneous inspection.
3-C. Installing joints.	6-C. Watchmen and flagmen.
3-D. Installing tie rods.	6-D. Tool repairs.
3-E. Installing or repairs to special work.	6-E. Temporary crossings for vehicle and foot traffic.
3-F. Installing bonding.	6-F. Installing temporary cross-overs for diversion of car traffic.
3-G. Surfacing and lining track or special work.	6-G. Switchmen and maintenance of cross-overs.
3-H. Grinding or rasping joints.	

While the above cover the units most required many of these may be combined without particular detriment to the results desired.

For obtaining these results a form similar to the one illustrated herewith is desirable.

While the keeping of the time and unit costs by this method naturally entails some expense and more than would be the case where there is no check on the time-keeper and he makes up the distribution the results obtained more than warrant any additional cost.

Overhead Straight Line and Angle Protective Crossing Clamps

The accompanying illustrations show types of straight line and angle protective crossing clamps manufactured by Edwin G. Hatch, engineer, New York, N. Y., which are designed to meet the precautions necessary to prevent telephone, telegraph or other lines falling on railroad right-of-way that they cross. The clamps are especially constructed so as not to strain or injure the line or insulator, and two insulators are located each side of the crossing, the extra insulator being used to provide a factor of safety. As a further precaution the crossing insulators should preferably be designed for considerably higher operating voltages than the ordinary line insulators.

OVERHEAD STRAIGHT-LINE CROSSING CLAMP

In the case of the clamps illustrated herewith, the line-gripping parts are not rigidly connected to and do not form part of the insulator-gripping part, but are capable of independent action and adjustment and are free to float with the line and assume any vertical angle the line may take. This prevents likelihood of kinks forming, of the "working" or "crystallizing" of certain sections and of breaks. The line-gripping parts are pivoted at A, so that they will always take the line angle readily and without straining the line. There is also provided at A a slot to allow for any small variation in the size of the insulator head, and to make certain that the weight of the line will come directly on the top of the insulator head as it should.

Where clamps consisting of two rigid members bolted together and fastened directly to the line and insulator have been used it sometimes happens that the line is carried entirely above the insulator top, or else the line may be carried by the insulator top but may be badly pulled down into the gripping members and kinked. Either occurrence is likely to prove injurious to line or insulator, or possibly to both. Furthermore, in the type of clamp described, which is meant to fit both the line diameter and the diameter of the insulator neck, it has been found that either one or other thread will be tight while the other will be naturally loose. If the line is not firmly gripped the value of the clamp is lost. At best, owing to the fact that neither the hard metal insulator-gripping clamp nor the insulator presents a uniform section, the clamping stress is likely to be exerted at a few points only. This tends to injure the porcelain. To prevent this it is well to insert a thin strip of lead or rubber between the two, assuring a good tight fit and a much more even distribution of stress over a greater surface.

In all clamps there should be an easy means of tightening up or adjusting the distance between the two

ANGLE PROTECTIVE CROSSING CLAMP

insulators. In most cases the turnbuckles shown in the illustrations afford a quick and effective means of doing this.

Split bushings are provided to prevent any possible abrasion of the line by the gripping members. The clamping bolts straddle the line, which assures good clamping action. The line-gripping parts, extending well out beyond the insulators, act as arcing shields and protect the conductor in case of flash-over. Provision is made against these members falling down against the insulator when the line breaks.

In the case of the clamp for use where the line crosses at an angle, shown herewith, wherever this angle is considerable it is good practice to divide the angle so that one-half will be handled at each end of the clamp. The clamp shown will take a total angle of very nearly 90 deg. without any special construction.

Safe Deposit Fare Box

The latest fare box manufactured by the Ohmer Fare Register Company, Dayton, Ohio, contains certain marked improvements over the earlier type of Ohmer

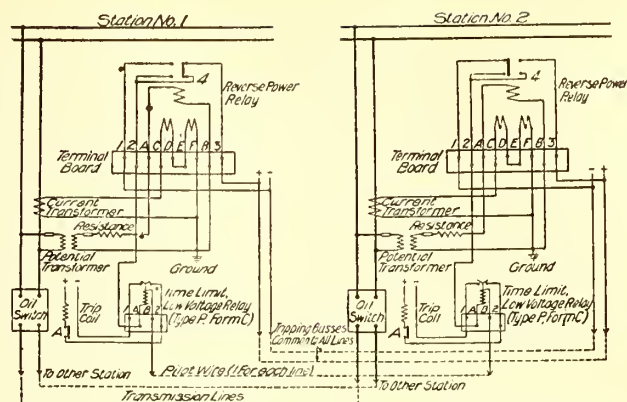

NEW FARE BOX

fare box, while all the good points of the latter have been retained. In developing the new type, the ideas and suggestions of electric railway men who have devoted much attention to the subject have been carefully considered, this being shown by the position and shape of the hopper which add materially to the efficiency of the machines. The locking devices for preventing the removal of the insert until all the fares have been dumped into it has been improved, and all interlocking parts have been strengthened so that the box is strictly foolproof. The upper part is square, while the insert is cylindrical in shape. The box is 26 in. high and 5 in. square at the top. It will be found to meet every possible requirement where a non-registering box is desired.

Relay for Protecting Single A. C. Tie Lines

Single-pole, double-throw relays of the type illustrated have recently been developed by the General Electric Company to provide a simple and effective means of isolating trouble automatically on a single tie line joining parts of an a.c. system. Two relays connected together by pilot wires are required on each end of a three-phase tie.

Under normal conditions, irrespective of the direction of the power, which may reverse at any time over the entire tie line, depending on the distribution of the load and the characteristics of the system, the relays have no effect on the oil switches. When the energy reverses over the entire line the relay contacts of the relays on both ends of the line swing over but do not trip the oil switches, because in each oil-switch tripping circuit there is included a low voltage time delay relay con-

SINGLE-PHASE CIRCUIT DIAGRAM SHOWING PRINCIPLE OF APPLICATION OF REVERSE POWER RELAY

nected as shown in the wiring diagram given directly above. The time delay feature is introduced to insure sufficient delay to allow the reverse power relay contacts to swing over on the occurrence of a normal reversal of energy in the tie line.

If, however, a short-circuit occurs in the tie line while power is being fed from one part of the system to the other, this power will go directly into the "short," while the power in the tie between the "short" and the part of the system previously receiving power will reverse and also feed into the "short." This will operate the contacts of the relay in the reversed portion of the line, which will result in opening the circuit of the time-limit low-voltage relays, the falling of whose plungers will close the oil-switch tripping circuits and cause the oil switches on both ends of the line to trip and isolate the line from the rest of the system. After the reverse power relay has operated by reason of a fault, the contacts will remain in the position which caused the switch to open, and before the oil switches are again closed this set of contacts should be reset by the knurled button on the front of the relay.

The accompanying half-tone shows the general construction of the relay. The contact arm is operated by a crank on the rotating shaft through a tension spring, which normally maintains contact, and also snaps the wedge to the other side when the crank moves past the center. The thumb nut on the center of the relay provides a means for throwing manually the contacts to either side.

The rotating shaft is pivoted on an adjustable ball bearing, which greatly reduces friction. The fixed current coil consists of two coils which are usually connected in series, while the movable potential coil is fastened to the rotating shaft and operates the contacts on the re-

REVERSE POWER RELAY, SHOWING PRESSURE AND CURRENT COILS AND CONTACT MECHANISM

reversal of power. The relays will not operate on overload or on trouble on other lines unless accompanied by a reversal of power only on one end of the line which they are meant to protect. They will, however, operate on very little reverse power, even at low voltage and low power factor.

Flexible Support for Lead-Covered Cable

Recently the Transit Development Company, Brooklyn, N. Y., installed on the elevated structure on Pitkin Avenue, Euclid Avenue and Liberty Avenue, from Shepherd Avenue to Ocean Avenue, No. 000, three-conductor, 11,000-volt, paper-insulated, lead-incased cable, weighing approximately $8\frac{3}{4}$ lb. per foot. The

FLEXIBLE CABLE SUPPORTS—SAMPLE BRACKET
AND METHOD OF ATTACHING IT TO
ELEVATED STRUCTURE

cable was hung from angle-iron brackets attached to the elevated structure at the transverse girders, approximately 50 ft. apart, by means of a catenary messenger cable. The messenger cable was a $\frac{1}{2}$ -in. Siemens-Martin steel strand, composed of nineteen No. 8 wires and having a breaking strength of 11,000 lb. It was attached to the brackets by means of Crosby clips. Details of a sample bracket are shown in an accompanying diagram.

Hung from the messenger wire at 10-ft. intervals by means of hangers like those shown in the second illustration was a $\frac{5}{16}$ -in. steel strand composed of seven No. 10 wires, to which the lead-covered cable was lashed at 12-in. intervals by means of five strands of $\frac{1}{4}$ -in. tarred marlin twine.

FLEXIBLE CABLE SUPPORTS—CATENARY HANGER AND
TWINE LASHING

Each hanger except the middle one consists of two Crosby clips of appropriate sizes connected by a loop of $\frac{5}{16}$ -in. steel strand, as shown in the second illustration. The support at the center span is a single clip, hangers like those shown in the illustration being used 10 ft. on each side of the center and still longer ones 20 ft. on each side of the center.

This method of support affords a very flexible suspension and minimizes the liability of damage to the lead sheath of the cable on account of the vibration to which the structure is subjected during train operation.

New Pinion Pulling Machine

The Electric Service Supplies Company, as exclusive selling agent, has placed on the market a new pinion-pulling machine of the Peerless type, which is designed to overcome all objectionable features found in many of the designs now in use. As shown in the accompanying illustration, the jaws are adjusted to suit the size of the pinion by means of hand wheels having square threads and are therefore locked in position. The pull is always in a straight line.

A very desirable feature of the machine is found in the operating head which can be raised or lowered to bring the center of the plunger level with the center of the armature shaft instead of blocking up the armature, a frequent necessity in machines without this feature. Other features are found in the plunger which

NEW PINION PULLER

does not revolve and thus prevents any injury to the armature shaft or its center. The plunger nut is back geared $3\frac{1}{2}$ to 1 so that only a short wrench is necessary for easy and rapid operation. Every part of the machine is steel except the plunger nut, which is phosphor bronze, and the base, which is cast iron.

Canadian Railway Employees Purchase Machine Gun

The *News-Telegram* of Calgary, Alta., has received a check for the sum of \$800 from the employees of the Calgary Municipal Railway, with which to purchase a machine gun for the Fifty-sixth Battalion. This contribution was raised from the employees of the Calgary Street Railway under the auspices of the Calgary Municipal Railway Social Insurance & Sick Benefit Association. In these days the street railway men are working, in many cases, on short time and upon a reduced schedule. Many of the former colleagues of the street railway men are wearing the king's uniform, especially in the Fifty-sixth Battalion, and when the subject of a machine gun was mentioned the campaign for funds was carried on by a committee of the men.

News of Electric Railways

SAFETY PRECAUTIONS IN NEW YORK SUBWAY

Extended Report on This Subject Made to the Mayor by the City Fire Department

An extended report on means to prevent fire in the subway and to suggest other fire precautions has recently been made by the Fire Department of the city of New York at the request of the Mayor following the fire which occurred in the subway near Fiftieth Street on Jan. 6, 1915. The report is signed by John Kenlon, Putnam A. Bates and Joseph O. Hammitt.

Among the recommendations made under the heading of "Fire Prevention" are the following: the substitution of steel cars for combustible cars; the isolation of all buildings in the subway by fire walls, with standard fire doors at all openings and all show windows in the subway stations cut off by fire walls in the stores back of them and equipped with automatic sprinklers; electric wiring installed in a fire-proof manner throughout and oil-filled transformers of the signal system kept free from oil on the exterior; the replacement of wooden switch cabinets by metal cabinets; the use of a slow burning wood in the third-rail guard when renewed; the use of metal for all news stands with self-closing doors in the lower portions and automatic covers held by fusible links over the upper or display portions; the covering with metal of all wooden doors to toilets, porter and transformer rooms; the use of metal for lockers; the use of waste cans in workshop and locker rooms with good house-keeping conditions; careful safeguarding of all highly inflammable liquids and solids kept in the subway, and the filling of buried kerosene tanks from the streets.

Under the subject of "Segregation of Electric Wiring Systems" the report recommends the following: a source of current supply for lighting, power, ventilating, signaling, fire-alarm and telephone systems independent of the source of power current; the complete isolation of the electric wiring of each system from that of all others; the installation of a system of emergency of pilot lights preferably fed from storage batteries; the duplication of the source of current supply of the general lighting system, so that in case of the failure of one source of supply, an emergency source will automatically be utilized; the installation of a fire alarm system connecting with fire headquarters; the installation of a telephone system separate from that now installed in the ticket office at each station with a series of telephone stations located every 500 ft.; a suitable form of signal lights to show the location of each fire alarm station, telephone station and exit, the circuit being independent of the general subway lighting system and capable of connection to the emergency source; adoption of vapor-proof type of rigid fixture for all electric lights throughout the subway except at stations; reconstruction of splicing chambers to secure complete segregation of electric wiring systems and prevent the escape of smoke or gases in the subway; a careful system of battery inspection and of the emergency lighting in each individual car, and the equipment of each car with portable electric lamps.

Under the heading of "Adequate Means of Escape" the report recommends the following: the division of the subway into two or preferably four separate tubes by longitudinal walls wherever the space between the tracks admits of such construction without seriously increasing the danger to gangs of trackmen and others whose duties require them to work in the subway, with openings through the walls for exits every 500 ft. and an exit to the street at each station from each tube thus formed; additional openings to the street at several locations with fans to increase rapidity, of ventilation in case of emergency; two 5-ft. iron stairways to be placed at each ventilating chamber, and where gratings are used over ventilating chambers they should be so designed as to be easily opened either from the chamber or from the street.

Under "Training of Employees" the committee recommends the following: train crew should test emergency lighting of trains before each trip; they should become familiar with the use of the portable electric lights, ladders,

extinguishers, fire alarm, and telephone systems, and location of exits; the Fire Department should be called immediately in case of fire.

REPORT OF PUBLIC UTILITY COMMISSIONERS OF NEW JERSEY

The Board of Public Utility Commissioners of New Jersey has issued its fifth annual report, for the calendar year 1914. A summary of the board's activities for this period was published in the *ELECTRIC RAILWAY JOURNAL* of Jan. 16, 1915, page 148. The volume contains a record of the commission's decisions with respect to applications for approval of securities, ordinances, leases, mergers and sales. Full details are also published of the inspections made of utility properties during the year. No decision upon the hearing of complaints are included, for these will be included in a separate volume. The record of accidents on electric railways for the year showed a total of twenty-two killed and 272 injured, as compared to 333 killed and 544 injured on steam railroads during the same period.

AMALGAMATED IN CONVENTION IN ROCHESTER

The fourteenth biennial convention of the Amalgamated Association of Street Electric Railway Employees of America was opened at Rochester on Sept. 13. The first day was given over largely to the work of organizing and to the presentation of the address of President W. D. Mahon. Much had been said in regard to the attitude of certain factions with respect to arbitration. Mr. Mahon said:

"In some cases of arbitration we have been sadly disappointed and our membership affected by the awards very much dissatisfied. And, because of these disappointments and dissatisfaction, there are those who advocate the repeal of our laws on this subject and the abandonment of arbitration entirely. Upon this proposal I would request you to consider well every phase of the proposition before you take any such action."

On the evening of Sept. 14 the delegates attended a dinner at the Powers Hotel. On Sept. 15 the jitney bus and the question of relations with the Brotherhood of Locomotive Engineers were considered. A report was also presented on wages in Europe. The only session on Sept. 16 was in the morning. The question of strike arbitration was referred at that session to the committee on law. A resolution was adopted by the convention providing that the Amalgamated use its influence with legislatures against measures aiming to establish a State constabulary.

FIRST REPORT OF PENNSYLVANIA COMMISSION

The Public Service Commission of Pennsylvania has issued its first annual report, for the year from July 27, 1913, to June 30, 1914, together with the report of the preceding State Railroad Commission from Jan. 1, 1913, to July 26, 1913. Of the fifty-one pending cases turned over to the Public Service Commission, forty-five were finally closed by the latter commission after its organization. Since June 30, 1914, 251 complaints have been filed with the new commission, of which 129 have been finally decided. Nearly all of the remaining ones await the filing of pleadings or the convenience of parties and counsel in arranging times for the hearings. On account of the newness of the commission, the report does not contain any financial statistics of electric railways, but it does include all complaints and orders received and issued during the year.

On the street railways 3161 persons were injured, of which number 170 were killed, the fatalities including fifteen employees, nineteen passengers, twenty trespassers and 116 others. These figures compare with 10,190 persons injured on the steam railroads, of whom 991 were killed. Included in the total number of accidents are twenty-nine persons killed and 222 injured at grade crossings of steam railroads and two killed and seventy injured at grade crossings of street railways. The commission abolished entirely sixty-one grade crossings and in six cases established undergrade crossings and in eight overhead crossings.

SUPERVISOR VOGELSANG AND PRESIDENT LILIENTHAL ON MUNICIPAL OWNERSHIP

The Question of the Purchase of the United Railroads Discussed by the Supervisor—Mr. Lilienthal's Attitude

Supervisor Alexander Vogelsang, chairman of the public utilities committee of the City Council of San Francisco, Cal., was quoted in part as follows in the *San Francisco Examiner* of Sept. 1:

"I believe that the city should take over not only the United Railroads but the California Street line. Let us have it all and have a thorough experiment in municipal ownership. We could do it if the people were willing. We have no definite plan now, but will get together after the election.

"The plan, of course, will take a lot of sound business judgment. We are bound to have trouble. I have had ideas on this subject for a long time. We should have one system in the city. It will save us much trouble in the long run, as the franchises run out in fourteen years, and we will have to prepare to do something then.

"I have no idea of issuing bonds for this project. It will take a charter amendment to permit the city to enter into an agreement with the United Railroads whereby the city might take over immediate operation. It would be my proposal, in a general way, to pay for the system out of the earnings of the lines.

"We might have a commission appointed to determine the value of the physical properties that the city would need and try to determine the value of the unexpired franchises. The aggregate would be the purchase price. If we could get control we could pay off this principal and interest out of the money taken in. We could not permit the road to become a burden to taxpayers."

Jesse Lilienthal, president of the United Railroads of San Francisco, was quoted on the same day in the same paper as follows:

"I have said before that a street railroad is a natural monopoly. I know the city would not feel inclined to sell out to the United Railroads. The alternative is for the United Railroads to sell to the city. As a private citizen I have favored the purchase, just as I favored the Spring Valley purchase. I believe a price could be fixed by some agreement acceptable to both parties if the question were properly approached. There is bound to be trouble as long as the present arrangement is in existence. It would be bad taste for me to offer the United Railroads for sale to the city. But, when the people of San Francisco actually want to go ahead and purchase the United Railroads they will find my door wide open."

NEW YORK LEGISLATIVE INQUIRY

The Thompson legislative investigating committee, which adjourned over the summer, resumed its work of inquiry into the Public Service Commissions of New York on Sept. 8. On that day the members formulated their plan of procedure and began the examination of witnesses on Sept. 9. Referring to the plans of the committee, Senator Thompson, the chairman, said: "We have come here to continue the investigation for which we were appointed, to make an examination of the public service law and transportation acts in order to report to the Legislature. The public service idea of supervision and regulation seems to be an established function of the State. The only way our act has been amended has been by adding new subjects for regulation. Whether public service regulation has been a success is very important to the State. We are anxious to make clear to the public just what our real function is—that it is to give as perfect regulation of public service corporations as is possible."

On Sept. 9 Chairman McCall of the Commission for the First District was questioned about the details of the construction and operating contracts under the dual system. Referring to the extent of the new system Mr. McCall expressed doubt about a 5-cent fare proving adequate. While the present Interborough lines were highly profitable, with the new system in operation the maximum haul would be three times as long as in the present subway. He thought that within five years after the completion of the

present extensive system, the city would again begin to feel the inadequacy of the transportation means in some sections.

DISTRICT OF COLUMBIA POWER ORDER

As a result of the hearings conducted by it on Aug. 25 and 26 into the inter-corporate relations of the Washington Railway & Electric Company and the Potomac Electric Company, the Public Utilities Commission of the District of Columbia is of the opinion that, pending the complete returns from the valuation of the properties now under way, the Washington Railway & Electric Company should among other things be ordered to discontinue the sale of power and the appropriation of revenues therefrom; that the company be ordered until further notice to pay the Potomac Electric Company a reasonable compensation for the power used by it in the operation of its railways based on the contract between the companies dated 1906; that the Potomac Electric Company be ordered to file with the commission rates for the sale of power to all other utilities than the Washington Railway & Electric Company; that the Potomac Electric Power Company be ordered to charge to railways other than the Washington Railway & Electric Company the scheduled rates for power furnished to them, collect the revenue therefrom, and include it in their revenues under the prescribed accounts; that the Potomac Electric Power Company be ordered to reduce its rates to consumers other than public utilities by an amount that will offset the increased amount received from the public utilities under the present proposed order.

It was the opinion of the commission that both companies should have an opportunity at a further public hearing to show cause why orders in conformity with the opinion in the case should not be made by the commission. It was voted by the commission to serve a copy of the opinion on the companies on Sept. 4 and to set a date by Sept. 15 for a further hearing.

WORK BEGUN ON NEW PHILADELPHIA SYSTEM

On Sept. 11 Mayor Blankenburg of Philadelphia turned the first shovelful of earth in the excavation for the Broad Street subway. In the course of his speech the Mayor said:

"We are making history here to-day. The turning of the first shovelful of earth, and thus taking the initial step in the development of our new subway system, appeals to me as one of the most important acts of my official life, for this great engineering work which we to-day inaugurate begins a new era in the life of Philadelphia."

A Merritt Taylor, Director of City Transit, said in part: "We are gathered here formally to begin the construction of a complete system of rapid transit lines for Philadelphia. The city is committed to the construction of this Broad Street subway and the Frankford elevated by contracts which have been executed. Public necessity will require proper terminal facilities for the gathering and distribution of Broad Street subway traffic, which can only be provided by the construction of a delivery loop.

"The city is committed by force of public necessity and by the requirements of fairness to the people of two important sections to build: A subway leading from the City Hall station of the Broad Street subway northwesterly beneath the Parkway connecting with the North Twenty-ninth Street elevated to be extended to Roxborough. An elevated railway from Thirty-second and Market Streets in West Philadelphia southwestwardly through the Woodland Avenue district.

"You will vote upon the proposed constitutional amendment relating to the city's borrowing capacity at the forthcoming election on Nov. 2. The question of how and by whom these lines will be equipped and operated must soon be determined. It is our plain duty first to offer the right to equip and operate these lines to the Philadelphia Rapid Transit Company upon terms which will protect the existing net income of that company against loss resultant from its co-operation with the city. One great machine will thus be established which will transport passengers quickly and conveniently between all points on the combined system in Philadelphia by the joint use of the surface system and the high-speed system for one 5-cent fare."

PROSPECTS OF NEW DES MOINES GRANT

Final settlement of the Des Moines street car franchise question now seems likely. The question of capitalization, a rock which wrecked the ship of negotiations several times before, is to be left out of the new franchise. The city has agreed to approve a franchise and submit it to the people without fixing the total amount of capitalization if the company will put in the franchise a clause guaranteeing service equal to the best in the country for a city of the size of Des Moines, regardless of whether or not the company can pay dividends.

Emil G. Schmidt, president of the Des Moines City Railway, made a verbal proposition of this nature while in conference with the City Council, and Mayor Hanna, who has fought the franchise, immediately declared it would be satisfactory if such a clause could be inserted. Mr. Schmidt said the franchise already made such provision and, such being the case, the settlement requires only the insertion of a specific clause covering ground already provided for in the present draft. The new grant was recommended to the City Council by a committee of the Des Moines Chamber of Commerce and is in many essentials like the draft which the company proposed to submit to the people last winter but was not voted upon because Mayor Hanna confused the issue with so many technicalities that the legality of the election would have been in question.

It is expected that the Council will be ready to submit the new franchise to the voters within a few weeks. Mr. Schmidt announces that business fell off during the State Fair this year as compared with last. The jitney practically has disappeared from the streets of the city and that institution has passed into history at Des Moines after a checkered local career of about six months.

RHODE ISLAND ARBITRATION HEARINGS

The Rhode Island Company has continued the presentation of evidence in its behalf in the arbitration hearings conducted at Providence. R. Roscoe Anderson, superintendent of transportation, discussed the cost to the company of guaranteeing a seven-hour day for extra men at the minimum rate demanded by the union. The difference in hours between the actual platform time for all extras and trippers and seven hours is 1086.5 hours daily. This at the minimum rate demanded would amount to \$325.95 a day, or \$118,971.75 a year. It is estimated by the transportation department that from 10 to 15 per cent of this increased outlay could be eliminated with revision of assignment schedules, making \$101,126 the net increase in yearly cost on the basis of 15 per cent reduction.

The difference between the amount of work for "report" men and a guaranteed seven-hour daily minimum is 507.5 hours a day. This at the minimum rate demanded would amount to \$152.25 a day, or \$55,892.51 a year. By rearrangement it is estimated that this increase could be reduced 75 per cent or to \$13,892.81, making the total minimum yearly cost to the company in granting the union's demands for a seven-hour daily guarantee for extras, trippers and report men, \$115,019.

C. A. Babcock, controller of the company, submitted a statement showing that in 1915 the motormen and conductors were paid in wages 24.7 per cent of the passenger receipts as compared with 20.98 per cent in 1908. Another exhibit showed that the average wage of 107 power house employees for the year ending June 30, 1915, was \$16.23 a week, compared with \$15.07 for 109 men in 1912. The average weekly pay of fifty-four linemen in 1915 was \$17.81, compared with \$14.38 in 1912 for forty-nine men. The average pay of motormen and conductors of all classes for the week ending Oct. 9, 1914, was \$14.62 for conductors and \$13.95 for motormen. The same comparison as of April 9, 1915, showed \$15.24 for conductors and \$14.83 for motormen. Mr. Babcock stated that the company's operating revenue for 1915 was much lower than for the two previous years, while its operating expenses were practically the same as in 1914. The surplus was \$116,000 less in 1915 than in 1914. Since 1908 the company has expended \$4,518,200 in the improvement of its physical property. Another statement showed a reduction in traffic on the Pawtucket division by 230,000 revenue passengers from 1913 to 1914, although the trans-

fer passengers had increased by 157,000. On this division, in 1915, there were 7,335,142 revenue passengers and 1,609,701 transfer passengers, so that in the past two years on that division alone the revenue passengers have dropped off by 317,000 and the transfer passengers have increased by 200,000.

In the last fiscal year the company gave its employees 2,199,260 free tickets, a substantial factor in their living cost. An exhibit was also presented showing increased earnings for spare conductors and motormen on thirteen divisions. For the week ended Oct. 9, 1914, 164 spare conductors earned an average of \$11.25 and 168 spare motormen earned an average of \$11.10. For the week ended April 9, 1915, 151 spare conductors averaged \$12.82 and 142 spare motormen \$14.18. The passenger income fell off \$267,000 this year and freight earnings dropped \$9,000. The percentage of freight revenue paid motormen, conductors and trainmen in that department was higher in 1915 than ever before, and the wages paid other employees of the freight and express department are the highest in the company's history.

REPORT OF GEORGIA RAILROAD COMMISSION

The Georgia Railroad Commission during its forty-second year of activity, ended Dec. 31, 1914, made final disposition of 598 petitions, complaints or subjects requiring formal action or order, this record showing a decrease of twenty cases as compared to the preceding year. This decrease is said by the commission to be caused by two factors—namely, the lessened volume of business done by utilities during the last four months of 1914 on account of the general business depression brought about by the European war, and to the much improved and more cordial relations now existing in Georgia between public utilities and the people served.

The net earnings of all public service corporations in Georgia for 1914 exceeded those of 1913 by \$1,773,713. The depressing effects of the European war were appreciably felt by all public service corporations, although not to the extent experienced by steam railroads. The financial returns of street railway, power, gas and electric light companies for 1914 showed an improvement, although the extent to which these companies shared in the general improvement is not capable of determination on account of the lumping of the statistics.

The street railways in the State carried 105,585,000 passengers during the year, without one passenger or employee being killed. Nine other persons were killed and 302 injured, however, while 994 passengers were injured and 129 employees injured, a total accident list of 1434, as compared to 1435 in 1913. The total number of persons killed and injured on steam railroads during 1914 was 1281 as compared to 2713 in 1913.

Seattle City Railway Transfer Plan Vetoed.—Mayor Gill of Seattle, Wash., has vetoed the ordinance offering transfers between Division A of the municipal car line and a private auto bus line running beyond the outer end of the line. The Mayor declared that the scheme would only add to the losses of the city car line, and make the city liable for damages incurred on the buses.

Alexandria Line Formally Taken Over by City.—The city of Alexandria, La., which recently purchased the Alexandria Electric Street Railway from the receiver has assumed charge of the system, which will be under the immediate supervision of Commissioner of Streets and Parks Irving McGinnis. Superintendent I. B. White, who has heretofore had the management of the system, will be retained as manager.

Automobile Chamber of Commerce on Jitneys.—At a meeting of the Automobile Chamber of Commerce in New York the traffic committee rendered a report of the shipment of cars during August, indicating that almost double the number of the previous year left the factories in that month. The figures were 15,141 carloads for last month, as compared with 8352 in August of last year. One account of the meeting says: "It was shown that the so-called jitney bus is a convenience that the public appreciates and a number of the street car companies are themselves organizing jitney bus lines as feeders to their regular traction business."

Conditions in Mexico City.—The New Orleans *Picayune* says that Francisco Villavicencio, Constitutionalist consul in

that city, has received a cablegram from Mexico City, Mex., as follows: "The employees of the Mexico City Tramway have been granted an increase of 31 per cent in wages and all cars in the city are now being operated. The Constitutionalist government advanced the company the funds necessary to meet the increase in wages for one month. The government will examine the company's books to ascertain if a permanent increase in wages is warranted by the revenues. Credit for the settlement of the strike is due entirely to Gen. Pablo Gonzales."

Municipal Ownership of Ontario Lines Recommended.—Definite steps for the acquisition of the street railway lines in Windsor, Walkerville and Sandwich, Ont., by the municipal interests will shortly be taken if a recommendation of the Ontario Hydroelectric Power Commission meets with the approval of the Councils of the three townships. The commission recommends that no further franchises be granted, and has urged that the construction of additional lines on streets where no franchises exist be commenced as early as practicable, these lines to be used at hydro-radials until the existing system has been taken over.

Massachusetts Companies Ordered to Give Notice of Changes in Signal Practice.—The Massachusetts Public Service Commission has ordered each railroad and street railway within its jurisdiction to give the board formal notice whenever such a company (1) purposes to install interlocking, block or special signals at any point on its lines in Massachusetts, stating the location and type of signal proposed; (2) whenever it is proposed to make any change in the location or type of interlocking, block or special signals, stating the location and change proposed; (3) when it is purposed to make any changes in the rules or regulations governing the use and operation of interlocking, block or special signals.

Supplementary New Haven Bill.—A supplementary bill of particulars has been filed by Assistant United States Attorney General Frank M. Swacker, in compliance with Judge William H. Hunt's order of Aug. 24, in the Federal District Court. The supplementary bill was requested by William Rockefeller and twelve other officers and directors of the New York, New Haven & Hartford Railroad so as to enable them to answer the indictment charging them with engaging in a conspiracy to monopolize interstate trade and commerce in violation of the criminal provisions of the Sherman anti-trust law. It is said that the government expects to bring the case to trial at the October term of the criminal branch of the United States District Court.

Toledo Rail-Light Team Holds Brooklyn Scoreless.—The fast Toledo Rail-Light Club, composed of employees of the Toledo Railway & Light Company, Toledo, Ohio, had the distinction on Sept. 10 of holding the pennant-chasing Brooklyn National League Club to an eleven inning scoreless tie. Jimmy Baxter, who pitched for Toledo, went the entire distance. He allowed only four hits and had eight strike-outs to his credit. Twice when the Brooklyns had men on third base with two out, Baxter whiffed the third man. Toledo was given a chance to see the veteran Coombs in action for Brooklyn. He pitched three innings. Dell and Appleton also were on the mound for Brooklyn. Nearly all the Brooklyn regulars were in the line-up.

Service on Electrified Philadelphia Line.—Regular electric service on the main line of the Pennsylvania Railroad between the Broad Street station, Philadelphia, Pa., and Paoli, was successfully inaugurated on Sept. 11. The first passenger train in the new service left Paoli at 5:55 o'clock in the morning, reaching Broad Street three-quarters of an hour later, on schedule time. Only one electric train will be operated on the line for the present. It will make four round trips every day. Electrification of the Chestnut Hill Line will begin immediately. The training of men for the Paoli service was described and illustrated in the *ELECTRIC RAILWAY JOURNAL* of May 22, 1915, page 970, while the installation itself was dealt with in an illustrated article which appeared in the issue of this paper for April 18, 1914, page 860.

Cleveland Smoke Abatement Report.—E. P. Roberts, engineer and former smoke inspector of Cleveland, Ohio, reported to a Council committee on smoke prevention re-

cently that it would require between \$20,000,000 and \$30,000,000 to electrify the railroads in and near Cleveland. P. T. White, division superintendent of the Big Four Railroad, told the committee that the smoke nuisance was due more to industrial plants than to the railroads. While Cleveland was a growing city, the railroads could not authorize the expenditure of such a vast sum of money as would be required to electrify them. S. D. Robertson, division superintendent of the Pennsylvania Railroad, said there are three industrial locomotives to one road locomotive in Cleveland. J. J. McNeil, representing the Erie Railroad, stated the attitude of that company.

Light Signals for Chicago, Milwaukee & St. Paul.—The Chicago, Milwaukee & St. Paul Railway has recently awarded a contract to the Union Switch & Signal Company for 130 miles of single-track, a.c., track-circuit signaling in Montana between Lennep and Three Forks, and between Piedmont and Finlen—these being portions of the new 3000-volt electrified territory. The signal transmission line is to be 4400 volts, 60 cycle, and will be supplied with power from three substations in the Lennep-Three Forks section, and from two substations in the Piedmont-Finlen section. Light signals with the lowest lens 16 ft. above rail level will be employed, these being of the Model 14 type with 10-in. lenses, giving indications by colored lights. Of the signals, 109 will have three lenses, and fifteen will have two lenses. The impedance bonds will have a capacity of 500 amp. per rail except at special locations where 1500-amp. bonds are to be used. The track relays will be of the new two-element, Model 15 vane type. Preparations for the installation of this material are now under way.

Trainmen Participate in Cash Distribution.—J. R. Harigan, general manager of the Kansas City, Clay County & St. Joseph Railway, Kansas City, Mo., announced in July that \$100 would be distributed to trainmen from whose cars no accidents were reported during August. During the previous months the business of the company suffered through excessive rainfall and high water; but in August, with fair weather, the gross receipts were \$65,525, the largest in the history of the road. Despite this large business there were only four minor accidents. All but eight of the trainmen, therefore, participated in the distribution of the \$100, which was divided under a plan based on the number of days each trainman had worked. The amounts received varied from \$1.24 to \$2.53—not very much, perhaps, but gratefully received, and a definite reward for extra care. A standard of accident-avoidance was set, to which the attention of the trainmen was called in September, with the suggestion that certainly they could do as well again. The distribution of money was confined, however, to August.

Pacific Electric Railway's Attitude Toward Elevated.—Paul Shoup, president of the Pacific Electric Railway, Los Angeles, Cal., asked the Board of Public Utilities for sixty days in which to ascertain whether he can raise the money to build the proposed elevated track from Los Angeles to San Pedro Street. The cost of the proposed elevated is estimated by the company at \$250,000. Mr. Shoup said that the company now faces obligations for street improvements amounting to \$514,000. Before the end of the year he declared this amount would probably be swelled to \$700,000. That the earnings of his company were but \$6,875,000 for the fiscal year ended June 30, 1914, as against \$7,328,000 for the year ended June 30, 1913, was stated by Mr. Shoup as proof of the concern of the company about making outlays for improvements. The Board of Public Utilities has issued what is in effect an ultimatum to the Pacific Electric Railway to build the elevated track from the rear of its station at Sixth and Main Streets, extending from Los Angeles to San Pedro Streets, to connect with the municipal railway, which the board wants the railway company to use more freely for an outlet for its interurban lines now run over Main and Hill Streets.

\$860,000 Station Finish Contract.—The Public Service Commission for the First District of New York has awarded the contract for station finish on the Jerome Avenue and White Plains Avenue rapid transit lines to the Altoria Realty & Construction Company, the lowest bidder,

for \$860,636. The Jerome Avenue line is a three-track elevated railroad branching off from the Lexington Avenue subway at 138th Street and Park Avenue and running north through River Avenue and Jerome Avenue to Woodlawn Road. It will also be connected with the west side elevated system by a line to be built through 162nd Street and eventually will be operated both by trains from the elevated lines and trains from the Lexington Avenue Subway. The White Plains Road line is a three-track elevated extension of the Lenox Avenue branch of the existing subway and runs from Bronx Park or 180th Street north through White Plains Road to 241st Street, near the northern boundary of the city. The steel structure on both lines is more than half completed and ready for the station finish. Both lines will be operated by the Interborough Rapid Transit Company under the dual system contracts. The contractor is allowed six months to finish each station, but must begin work within thirty days after notification by the commission's engineer that a station is ready for the finish.

Yonge Street Case Decided.—The Ontario Railway & Municipal Board has handed down a decision in favor of the Toronto Railway in the Yonge Street extension case. The board issued an opinion to the effect that the company had the right to extend its Yonge Street tracks north from the present terminal to the much contested point above the Canadian Pacific Railway tracks. The chairman, in the judgment, states that the opinion of the board will be backed up by an order requiring the company to lay tracks on Yonge Street to cover the space caused by the removal of the Metropolitan Railway tracks by the city. The board finds that as a fact that the equipment, appliances and service of the Toronto Railway in respect to the transportation of persons along the portion of Yonge Street shown on the plans filed are inadequate, and the board is of the opinion that the Toronto Railway should be required to construct, maintain and operate an extension of its existing lines northerly on Yonge Street with facilities for branching at Woodlawn Avenue, as shown on the plans filed. On June 29 the Board of Control of Toronto instructed Works Commissioner Harris to tear up the remainder of the tracks of the Toronto & York Radial Railway's Metropolitan Division on Yonge Street south of Farnham Avenue, claiming the franchise had expired and that the sale of the Metropolitan to the Toronto Railway included only physical property. The case was referred to at length in the *ELECTRIC RAILWAY JOURNAL* of July 3, page 36.

PROGRAMS OF ASSOCIATION MEETINGS

Illinois Electric Railways Association.

The regular meeting of the Illinois Electric Railways Association which was to have been held on Sept. 17 has been postponed until a date not yet fixed, but which will be after the San Francisco convention of the American Electric Railway Association. It is planned to review at the Illinois association meeting some of the subjects discussed at the national convention.

Colorado Electric Light, Power & Railway Association

The following program of papers of interest to electric railways has been announced for presentation at the meeting of the Colorado Electric Light, Power & Railway Association at Colorado Springs on Sept. 23, 24 and 25:

"Valuation of Public Utility Properties," by F. J. Rankin, engineer of the Colorado Public Utilities Commission, Denver, Col.

"A Uniform System of Accounting," by Fred W. Herbert, auditor of the Colorado Public Utilities Commission, Denver, Col.

"The Indeterminate Franchise and the Certificate of Public Convenience and Necessity," by M. H. Aylesworth, member and attorney of the Public Utilities Commission of Colorado.

"Depreciation as Affecting Valuation and Assessment," by Daniel W. Knowlton of Smith, Knowlton & Hatch, attorneys, Colorado Springs, Col.

"Present-Day Street Railway Problems," by W. N. Casey, Denver (Col.) City Tramway.

All of these papers will be presented at the sessions on Sept. 24.

Financial and Corporate

ANNUAL REPORTS

Third Avenue Railway

The consolidated comparative statement of income, profit and loss of the Third Avenue Railway, New York, N. Y., for the years ended June 30, 1914 and 1915, follows:

	1915	1914	Change
Operating revenue:			
Transportation	\$10,565,027	\$10,456,705	+\$108,322
Advertising	95,250	103,000	—7,750
Rent of equipment	16,470	27,280	—10,809
Rent of tracks and terminals	73,441	72,882	+558
Rent of buildings and other property	84,710	85,447	—736
Sale of power	50,959	112,900	—61,941
Total operating revenue	\$10,885,859	\$10,858,216	+\$27,643
Operating expenses:			
Maintenance of way and structures	\$925,973	\$1,012,646	—\$86,672
Maintenance of equipment	678,573	713,003	—34,429
Depreciation accruals	562,958	511,250	+51,708
Power supply	779,458	779,130	+327
Operation of cars	2,914,525	2,849,929	+64,595
Injuries to persons and property	602,798	614,609	—11,810
General and miscellaneous expenses	511,890	526,466	—13,576
Total operating expenses	\$6,976,179	\$7,006,035	—\$29,855
Net operating revenue	\$3,909,680	\$3,852,180	+\$57,499
Taxes	731,034	730,784	+250
Operating income	\$3,178,646	\$3,121,396	+\$57,249
Interest revenue	81,127	75,215	+\$5,912
Gross income	\$3,259,773	\$3,196,611	+\$63,161
Deductions from gross income	2,565,730	2,570,305	—4,575
Net income	\$694,043	\$626,306	+\$67,737

NOTES:

Interest on certificates of indebtedness of the Dry Dock, East Broadway & Battery Railroad has not been included in the accounts since Feb. 2, 1908.

Operations of the Mid-Crosstown Railway are included for the entire fiscal year ended June 30, 1915, and from April 17 to June 30, 1914.

Operations of the Pelham Park & City Island Railway are included in the fiscal year of 1915 only.

The net earnings for the last two years have been less than could have been reasonably anticipated. First, because in the last two years there was an abnormal series of snow storms, which cost the company at least \$300,000, and in the year which has just expired there has been a decrease caused by the general depression of business and the necessity which the people feel for economy. This is further evidenced by the fact that the applications for employment during the year were at least twice as large as during any previous year in the present administration and as a whole from a better class of men. Nevertheless, the fact that the earnings should have reached in these two unpropitious years so large a sum justifies the conclusion that the interest on the adjustment bonds may be considered hereafter as certain to be earned and paid by the company.

The report contains interesting statements showing the amount of expenditures which can be immediately foreseen, nearly the whole of which should theoretically be expended during the year 1916. They aggregate a very large sum and only a small part of the expenditures put down for 1915 have as yet been made, though it must be added that ultimately all of them must be made. An examination of these budget statements will show that they embody (a) the cost of certain extensions, \$560,000 for upper Broadway and \$250,000 for an extension of the City Island line. (b) The cost of certain new cars. (c) The cost of repaving and relaying the tracks in certain streets under which the city has been building subways. (d) The cost of relaying the track and repaving part of Third Avenue and Fifty-ninth Street, which has been or will be ordered by the Public Service Commission, and, like the previous item, is compulsory. President Whitridge includes these figures because it is not generally understood how powerless a street railway company is to control its own expenses and because so much has been said about dividends.

In regard to dividends President Whitridge says:

"If those budget statements were to be taken literally it would seem to be impossible that the expectations the stockholders have entertained in respect to dividends should

not be disappointed. They are not, however, to be taken literally, because they are based, in a large part, upon the work proposed to be done by the city, and what the city officials say they are going to do and what the city actually does are found to be quite different things. In the long run the company would probably be better off if all of these expenditures were paid out of the earnings of the company and if no more money were borrowed through the issue of bonds. In last year's report it was said that dividends should only be paid when the money is in the bank with which to pay them, and there is no immediate prior claim upon it. I think that this condition will be met within a measurable time, and I hope and expect that if there be no material decrease in net earnings it will therefore be possible to declare and pay a dividend within the next twelve months."

The benefit association after six years of existence has to its credit in cash and securities \$86,198. During the year ended Dec. 31, 1914, there was paid out to 625 members for relief \$13,702, and during that period the association physician treated more than 1300 cases. Since the insurance feature of this work went into effect on Dec. 25, 1913, there have been twenty-six deaths, the beneficiary in each case receiving \$1000.

Interborough Rapid Transit Company

The comparative statement of income, profit and loss of the Interborough Rapid Transit Company, New York, N. Y., for the years ended June 30, 1914 and 1915, follows:

	1915	1914
Gross operating revenue.....	\$33,433,742	\$33,515,395
Operating expenses	12,941,314	12,902,053
Net operating revenue.....	\$20,492,428	\$20,613,342
Taxes	2,133,980	2,081,948
Income from operation.....	\$18,358,448	\$18,531,394
Non-operating income.....	623,631	612,852
Gross income	\$18,982,079	\$19,144,246
Income deductions	10,913,595	11,119,666
Net corporate income for the year.....	\$8,068,484	\$8,024,580
Surplus, June 30, 1914, and June 30, 1913	15,214,403	13,072,956
Tax refunds and other credits.....	17,477	23,059
Totals	\$23,300,364	\$21,120,595
Taxes prior years, amortization, capital retirements and other charges.....	\$791,255	\$656,192
Dividends	7,000,000	5,250,000
Total appropriations	\$7,791,255	\$5,906,192
Profit and loss—surplus.....	\$15,509,109	\$15,214,403

The gross earnings for the fiscal year ended June 30, 1915, were substantially the same as last year. The present year witnessed the first interruption in the annually recurring increases in the gross earnings since the opening of the subway for operation. This was caused by the general business depression of the country. The gross operating revenue for the year was \$33,433,742, as compared to \$33,515,395 last year, a decrease of \$81,652, or 0.24 per cent, the result of a gain on the subway division of \$283,237, or 16.1 per cent, and a loss on the Manhattan Railway elevated division of \$364,889, or 2.29 per cent. The increase in the earnings of the subway division was largely caused by a substantial gain in traffic in that portion of Bronx Borough served by this division, and also by the increased business in the shopping and amusement district at Grand Central and Times Square Stations. The decrease in the earnings of the Manhattan Railway elevated division was caused by the general depression in business conditions throughout the city; the curtailment of activities among manufacturing establishments along the Second and Third Avenue lines and the falling off of foreign travel which especially affected the Ninth Avenue line.

The operating expenses were \$12,941,314 as compared to \$12,902,053 last year, an increase of \$39,261, or 0.30 per cent, the result of an increase on the subway division of \$31,252, or 0.50 per cent, and an increase on the Manhattan Railway elevated division of \$8,008, or 0.12 per cent. The amount charged to operating expenses and credited to depreciation reserve was \$230,719 more than the previous year, whereas the expenditures for maintenance showed a decrease of \$152,467, resulting in a net increase in charges for both depreciation and maintenance of \$78,252. Owing to the changing conditions in the distribution of the density of traffic,

throughout the non-rush hours on both the subway and elevated divisions, it was found necessary and expedient in furnishing service amply sufficient to meet the needs and comfort of the traveling public to increase the car mileage on the subway division to the extent of 2,010,943 car miles, and on the elevated division by 551,202 car miles. This increase in car mileage was responsible for an increase in the cost of transportation amounting to \$89,142.

The net operating revenue was \$20,492,428, as compared to \$20,613,342 last year, a decrease of \$120,913, or 0.58 per cent, the result of a gain on the subway division of \$251,984, or 2.21 per cent, and a loss on the Manhattan Railway elevated division of \$372,898, or 4.04 per cent. The total amount of taxes was \$2,133,980, as compared to \$2,081,948.43 last year, an increase of \$52,031, or 2.50 per cent, the subway division showing an increase of \$56,183, or 14.55 per cent, and the Manhattan Railway elevated division a decrease of \$4,151, or 0.24 per cent. The long litigation involving the constitutionality of the State tax law, which had been held to impose a tax upon the company with respect to its subway operation, measured by a percentage of its earnings from that operation, was concluded this spring by a decision of the United States Supreme Court upholding the statute in question as constitutional and confirming the assessments. The taxes due under the disputed provision had been paid, however, so that this adverse decision made no unexpected drains upon the treasury.

The income from operation decreased \$172,945, or 0.93 per cent, there being a gain on the subway division of \$195,801, or 1.78 per cent, and a loss on the Manhattan Railway elevated division of \$368,746, or 4.90 per cent. The non-operating income increased \$10,778, or 1.76 per cent, principally because of the increase in interest on bank balances and loans. The gross income decreased \$162,166, or 0.85 per cent, the result of a gain on the subway division of \$127,166, or 1.10 per cent, and a loss on the Manhattan Railway elevated division of \$289,333, or 3.81 per cent. Income deductions decreased \$206,070, or 1.85 per cent, a variation incident to the refunding operations effective Nov. 1, 1913.

The surplus over dividends of 20 per cent (including extra dividends of 10 per cent) on the capital stock was \$1,068,484. On the basis of 10 per cent dividends for one year the surplus for 1915 would be \$4,568,484, as compared with \$4,524,580, a gain of \$43,904 in surplus over the previous year. The directors declared extra dividends amounting to 10 per cent during the year payable out of surplus, notwithstanding which there was an increase of \$294,705 in the profit and loss surplus during the year.

The number of passengers carried was 647,378,266 compared with 651,886,671 last year, a decrease of 4,508,405, or 0.69 per cent, the result of a gain on the subway division of 5,172,646, or 1.52 per cent, and a loss on the Manhattan Railway elevated division of 9,681,051, or 3.11 per cent. The subway division continues to reap the benefit of real estate development along streets and avenues contiguous thereto, while the traffic on both divisions reflects the prevailing business depression.

For maintenance of the structures and roadway of both divisions the sum of \$1,545,949 was expended. This compares with \$1,758,051 thus expended in 1914. The expenses for maintenance of equipment totaled \$2,002,095 for the last year as compared to \$1,942,461 for the preceding year. The total maintenance appropriation, including depreciation, was \$4,109,260 in the last year and \$4,031,008 the year before. Expenditures for additions and betterments during the last year aggregated \$24,274,028, including payments made during the year on account of construction and equipment of new subways and elevated third-tracking, extensions and power plant improvements.

In an interesting summary the annual report states that since 1908 the gross earnings have increased from \$24,699,505 to \$33,433,742 in 1915, or \$8,734,237, equal to 35.36 per cent. The net operating revenue has increased from \$13,976,810 in 1908 to \$20,492,482 in 1915, or \$6,515,618, equal to 46.62 per cent. The net corporate income has increased from \$3,700,659 in 1908 to \$8,068,484 in 1915, or \$4,367,825, equal to 118 per cent. For 1908 the ratio of net corporate income to gross earnings was 14.99 per cent. For the year 1915 it was 24.13 per cent, a gain of 9.14 per cent. Expressed in terms of dollars and cents this means that in 1908 out of

each \$100 of gross earnings \$14.99 was saved for net corporate income, while in 1915 out of each \$100 of gross earnings an amount of \$24.13 was saved for net corporate income.

This result has not been attained at the expense of "up-keep" of the property and rolling stock, for the following table reflects the amount of money appropriated for this purpose out of each \$100 of gross earnings for each fiscal year since 1908.

1908.....	\$12.75	1912.....	\$14.27
1909.....	11.56	1913.....	13.85
1910.....	11.00	1914.....	12.03
1911.....	13.92	1915.....	12.29

The large appropriation for maintenance for 1911, 1912 and 1913 was caused by the fact that during this period \$1,005,050 was absorbed in the operating expenses of the subway division for the installation of electro-pneumatic brakes, new drawbars, coasting recorders and for reinforcing copper sheathed cars, and \$286,000 was spent on the elevated lines for installing line switches, conductors, emergency valves and coasting recorders. In addition to taking care of these extraordinary expenditures in maintenance expense, there has been set up a reserve for depreciation out of operating expenses, since 1909, amounting to \$2,292,637.

During this period of eight years the cost of production, as measured by the ratio of transportation expense to gross earnings, has been reduced as follows:

	Per Cent		Per Cent
1908.....	25.89	1912.....	23.50
1909.....	24.43	1913.....	22.80
1910.....	23.24	1914.....	22.46
1911.....	23.89	1915.....	22.79

This reduction in relative cost of operation has been accomplished notwithstanding that during this period the rate of pay of practically all employees was substantially increased, while the cost of material has also shown a general upward trend. This improvement resulted from improved train service and the economies which have followed the installation of improved machinery and certain improvements to the physical property, making possible the operation of ten-car trains.

The ratio of fixed charges (including taxes) to gross earnings has been reduced from 43.95 per cent in 1908 to 39.02 per cent in 1915, as follows:

	Per Cent		Per Cent
1908.....	43.95	1912.....	41.54
1909.....	44.57	1913.....	40.58
1910.....	42.45	1914.....	39.39
1911.....	42.32	1915.....	39.02

This reduction in relative fixed charges was, in a large measure, caused by the increasing density of traffic with its resultant increased earnings per train and car mile. When such reduction, however, is considered in conjunction with the marked reduction in cost of production, as measured by transportation expenses, it illustrates that such additional capital expenditures as have been made for improving the property and equipment have contributed their full quota of economies to the general result that has been obtained.

The payments in claims, suits and judgments were \$320,660 in 1915 and \$296,414 in 1914, while the expenses of the claim department totaled \$195,056 and \$160,148, making the respective totals \$515,716 and \$456,563. The increase over last year (\$59,153) is approximately the same amount as the decrease (\$58,995) of 1914 under 1913. The total disbursements for 1915 (\$515,716) were exactly \$158 more than the total for 1913 (\$515,558). The number of actions against the company continues to increase notwithstanding the policy of settlements without litigation. While the plaintiffs in these suits were successful in even a smaller percentage of the cases tried this year than last, the expenses necessarily increase in proportion to the volume of cases tried. The disbursements for claims, suits and judgments amounted to 0.96 per cent of the gross operating revenue and the expenses were 0.58 per cent, making an aggregate for the year of 1.54 per cent as compared with percentages amounting to 1.36 last year and 1.58 the year before.

EARNING POWER ESTIMATED

United Railways Investment Company Shows Increased Earnings as Based on Equities in Estimated Surplus of Subsidiaries

As the annual report and other statements of earnings of the United Railways Investment Company, San Francisco, Cal., include in income only the actual dividends received on securities owned, the real earning power of the company is not actually shown as would be the case were it an operating instead of a holding corporation. It owns the entire equity in the United Railroads of San Francisco, but as this company pays no dividends, the earnings being used to pay off underlying bonds, the surplus earnings do not show in the income statement of the holding company. The United Railways Investment Company also owns a large part of the equity in the Philadelphia Company, Pittsburgh, Pa., and its subsidiaries, but in this case also there is shown only the amount actually received in dividends, and not the large equity in the annual surplus of the Philadelphia Company remaining after dividends have been paid.

As an indication of this earning power, an income statement of the United Railways Investment Company has been prepared for the year ending March 31, 1916, based on its equity of approximately 62 per cent in estimated earnings of the Philadelphia Company, as follows:

	1916	1915
Earnings on Philadelphia Company stock owned*	\$3,146,000	\$2,347,400
Other dividends, interest, etc.	176,510	176,510
Total income	\$3,322,510	\$2,523,910
Expenses	77,737	77,737
Net earnings	\$3,244,773	\$2,446,173
Interest charges	1,182,168	1,182,168
Preferred dividends	800,000	800,000
Balance for United Railways Investment Company common stock	\$1,262,605	\$464,005

*Partly estimated. Includes four months' actual earnings.

This would indicate that from its equity in the Philadelphia Company and the latter's subsidiaries and other dividends and interests, the United Railways Investment Company would earn on its \$20,400,000 of common stock for the year ending March 31, 1916, about 6.2 per cent. The large gains shown in the earnings accruing from the Philadelphia Company and its subsidiaries arise from the increased revenue coming to these companies from the material improvement in the industrial situation in the Pittsburgh district. It is stated that if the equity in the earnings of the United Railroads of San Francisco were included in the above estimate, the showing for the stocks of the United Railways Investment Company would be much larger. It is believed that its securities have an intrinsic value well in excess of their present market value, and that in time a plan will be evolved which will permit funding of the dividends now in arrears on the company's preferred stock, so that it may be placed in position again to receive regular dividends.

PRELIMINARY STATEMENT ISSUED

A preliminary income statement of the Aurora, Elgin & Chicago Railroad, Wheaton, Ill., for the year ended June 30, 1915, shows a decided falling off in revenue as compared with the preceding fiscal year. The annual meeting of the company will be held Oct. 19, when a complete report of the operations for the year will be presented. For the fiscal year the gross earnings decreased \$130,483, and the net earnings were lower by \$92,248. Taxes and interest charges increased \$13,038 and the charges for amortization and depreciation were \$45,569, as compared with \$4,236 the preceding year. There was a balance for dividends of \$165,565 as compared with \$312,184 for the preceding year. The balance was equal to 5.34 per cent on the \$3,100,000 of preferred stock, on which quarterly dividends of 1½ per cent are being paid, so the company had to encroach slightly on its accumulated surplus to provide for the distribution on the preferred.

GALVESTON-HOUSTON PASSES DIVIDEND

Generally Unsatisfactory Business Conditions, Jitney Competition and Damage Done by Recent Storm Lead Company to Conserve Cash Resources

The directors of Galveston-Houston Electric Company, Galveston, Tex., have declared a semi-annual dividend of \$3 per share on the preferred stock, payable on Sept. 15, 1915, to stockholders of record on Sept. 11, 1915. The dividend normally payable on the common stock on the above date, however, has not been declared. Since March, 1914, semi-annual dividends of \$3.50 per share have been paid on the common stock.

According to an official statement from the board of directors, the passing of the dividend on the common stock at this time is chiefly caused by the loss in earnings on account of the operation of jitney buses in Houston during a period when business conditions have been generally unsatisfactory. Another burden has been added by the recent storm which swept the Texas gulf coast cities, causing an interruption of service which will be reflected in a temporary reduction of the company's earnings and necessitating unusual expenditures for rehabilitation.

In the directors' opinion a careful study of jitney operation throughout the country gives every indication that such cars, under fair and reasonable regulation, cannot be operated permanently and profitably in competition with street railways. Jitney operation in Galveston has been negligible and a regulatory ordinance is being enforced. In Houston jitneys have been operating without regulation for about nine months, rapidly increasing in number until during the last three months more than 750 automobiles have been in operation. A regulatory ordinance was passed in June, but was not enforced until Sept. 1, since which date the number of cars in operation has decreased materially.

In regard to the recent storm, the directors state that the damage was more serious to the interurban line than to the properties in Galveston and Houston. Service in Galveston and Houston is now practically normal. On the interurban line, while the concrete arched section of the causeway across Galveston Bay remained intact, about a mile of that portion constructed of concrete side walls with sand filling was destroyed. This caused a suspension of through service into Galveston for sixteen days. A two-hour schedule, however, is now being maintained over temporary trestles, and it is expected that normal hourly service will be re-established shortly. Reconstruction is progressing as rapidly as possible.

The company is said to be at present in a strong position financially and it has a substantial cash balance and practically no floating debt. With the enforcement of the regulatory ordinance in Houston and the resumption of normal through service on the interurban line, the earnings should show gradual improvement. Under present conditions, however, the directors felt that the cash resources should be conserved.

Ashland Light, Power & Street Railway Company, Ashland, Wis.—The Wisconsin Railroad Commission has authorized the Ashland Light, Power & Street Railway Company to sell \$100,000 of first mortgage 5 per cent bonds at not less than 75 to defray the cost of building a 1500-kw. turbine plant in Ashland.

Electric Investment Company, New York, N. Y.—On Sept. 1 a deed was filed in the office of the county recorder at Boise, Idaho, conveying the property formerly owned by various subsidiaries of the Idaho Railway, Light & Power Company to the Electric Investment Company, into which all the large power, light and transportation interests in Idaho except the Boise Railroad were recently merged. The Electric Investment Company was incorporated under Delaware laws in January, 1915, with \$50,000 of authorized capital stock, all of which is owned by the National Securities Corporation. This latter company, which is controlled by Electric Bond & Share Company interests, is the one that was authorized by the Idaho Public Service Commission to effect the amalgamation of the various properties in Idaho, as mentioned in the ELECTRIC RAILWAY

JOURNAL of June 19. The property of the Idaho Railway, Light & Power Company was sold under foreclosure sale in Boise on June 14 for \$4,542,759, the upset price, to the Electric Investment Company, the purchasing corporation for the National Securities Corporation. Among the properties now transferred by deed are the Boise Valley Railway properties, the Boise & Interurban property, the Nampa-Caldwell extension and the Caldwell offices, station and grounds.

Hudson & Manhattan Railroad, New York, N. Y.—The Hudson & Manhattan Railroad has been authorized by the Public Service Commission for the First District of New York to issue \$615,000 of first lien and refunding mortgage bonds of 1913 to reimburse the treasury for expenditures made for additions and betterments, \$212,000; to retire underlying mortgages, \$50,000, and to make payments on rolling stock, \$255,000. The commission closed the hearing on this petition and reported favorably in the record time of half an hour.

Phoenixville, Valley Forge & Stafford Electric Railway, Phoenixville, Pa.—At a meeting on Sept. 4 stockholders representing 75 per cent of the shares agreed to the sale of the Phoenixville, Valley Forge & Stafford Electric Railway to the Philadelphia & Western Railway, Upper Darby, Pa. It is said that work will be begun soon on the building of a line from Valley Forge to Bridgeport, where it will connect with the Philadelphia & Western Railway's line to Sixty-ninth Street.

Portland Railway, Light & Power Company, Portland, Ore.—Completion of the refinancing plan of the Portland Railway, Light & Power Company, whereby \$1,250,000 of new capital is obtained by the withdrawal of common stock and the issue of preferred in its place, was marked by a certificate issued on Sept. 2 by Corporation Commissioner Schulderman, authorizing the plan. A. T. Huggins, treasurer of the company, stated that all the holders of common stock had completed their payments of \$25 per share on the stock canceled, and had received the like amount of preferred at the premium stated. "The commissioner's certificate is the final step," said Mr. Huggins. "The negotiations for the new money were practically completed on June 30, but about \$200,000 of stock was still outstanding. This was taken up by a syndicate, however, which allowed the program to go forward until all the stock to be retired was sent in." The readjustment plan was described in detail in the ELECTRIC RAILWAY JOURNAL of May 1. The plan involved the cancellation of \$5,000,000 of the \$25,000,000 common stock issue and the authorization of \$5,000,000 of first preferred and \$5,000,000 of second preferred stock, half of each to be now retained in the treasury.

Tulsa (Okla.) Traction Co.—The Tulsa Traction Company, incorporated in August with \$100,000 of capital stock to succeed the Oklahoma Union Traction Company, which as stated in the ELECTRIC RAILWAY JOURNAL of Feb. 13 was sold at receiver's sale on Feb. 5, has completed its reorganization of the city lines in Tulsa, according to A. J. Biddison, vice-president of the company. In the charter obtained by the reorganized company it is set forth specifically that the main purpose of the corporation is to extend the lines of the company to Sapulpa, Collinsville and Okmulgee. The line to Okmulgee will go by the way of Bixby, and from there a branch line will be extended to Broken Arrow. By the terms of the charter the company also is authorized to operate street car lines in Sapulpa, Okmulgee and Collinsville. The company now operates 6 miles of single track and reaches Orcutt Lake. The officers are G. C. Stebbins, president; A. J. Biddison, vice-president; I. F. Crow, secretary, and B. C. Redgrove, superintendent.

Union Traction Company, Santa Cruz, Cal.—W. R. Porter, W. J. Dutton, Fred Beaver, all of San Francisco; W. T. Netherton, San José, and J. W. Forgeus, Williams, have been appointed as the protective committee for the bondholders of the Union Traction Company. A previous item regarding this company was published in the ELECTRIC RAILWAY JOURNAL of Aug. 28. It is reported that the company defaulted in the payment of interest on \$613,000 of bonds, due the first of this month.

Wilmington Southern Traction Company, New Castle, Del.—It is reported that E. Clarence Jones has again

assumed control of the Wilmington Southern Traction Company. Three years ago Mr. Jones sold this property to the Wilmington, Newcastle & Delaware City Railway, but the terms of the contract of sale were not complied with and it now reverts to its former owner. In the future the two companies will be operated independently, although an arrangement for the exchange of traffic which is now operated will be continued. The Wilmington Southern Traction Company comprises 6.7 miles of line between Wilmington and Newcastle, while the Wilmington, Newcastle & Delaware City Railway operates a 10.5 mile line between Delaware City and Newcastle.

DIVIDENDS DECLARED

Brockton & Plymouth Street Railway, Plymouth, Mass., 3 per cent, preferred.
California Railway & Power Company, San Francisco, Cal., 1¼ per cent, prior preference.
Capital Traction Company, Washington, D. C., quarterly, 1¼ per cent.
Duluth-Superior Traction Company, Duluth, Minn., quarterly, 1 per cent, preferred.
Galveston-Houston Electric Company, Galveston, Tex., 3 per cent, preferred.
Illinois Traction System, Peoria, Ill., quarterly, 1½ per cent, preferred.
Manila Electric Railroad & Light Corporation, Manila, P. I., quarterly, 1½ per cent.
Philadelphia (Pa.) Traction Company, \$2.
Twin City Rapid Transit Company, Minneapolis, Minn., quarterly, 1¼ per cent, preferred; quarterly, 1½ per cent, common.
West End Street Railway, Boston, Mass., \$1.75, common.

Traffic and Transportation

JITNEY JOTTINGS

The Jitney Before the Pennsylvania Commission—Developments in Houston and Dallas

Steps to settle immediately the status of jitneys as public utilities in comparison with the rights of incorporated common carriers are to be taken at once by the Public Service Commission of Pennsylvania. The decision as to whether jitney service may be started without first receiving permission from the commission in the form of a certificate of public convenience will be State-wide in effect. The Scranton Railway, of which C. L. S. Tingley is vice-president, raised the issue in three cases, alleging that M. J. Walsh, Forest City; S. Wilson and F. Williams, Vandling, and W. H. Owens, Scranton, are illegally operating jitney lines between towns covered by its system. It is charged that they cover the same road as the electric railways; that they divert business from the electric railways, and that they cause loss to the company besides operating without State approval. Chairman Ainey of the commission directed that the persons complained of be notified and asked if they desire to join issue. If answers are filed, hearings will be held soon, probably in Scranton.

The provision of the jitney ordinance of Houston, Tex., requiring an indemnity bond has been eliminated and the petition for a referendum election has been withdrawn. The ordinance requiring a license fee of \$72 went into effect on Sept. 1 and there are now only about half the number of jitneys in use as were formerly in operation. There has been some agitation in favor of placing a reduced bond requirement in the ordinance, but the City Council opposed this. Commissioner Pastoriza, who recently returned from the Pacific Coast where he studied the jitney, said that bonds had a tendency to increase the recklessness of the drivers, as they seemed to feel that there was no necessity for careful driving as long as the bonding companies paid for the damage inflicted. Mayor Campbell stated that since the present ordinance had been accepted by the jitney men in good faith he did not favor any change unless the measure should prove inadequate after trial.

The jitney drivers of Dallas, Tex., members of the chauffeurs' union, have given to the press for publication a set of resolutions containing a general denouncement of the so-called compromise ordinance and claiming that the destruction of the petition bearing the names of more than 4000 voters for an initiative election on a new ordinance was never agreed to by the jitney drivers. The work of getting the necessary number of signatures on a petition for a new ordinance will be undertaken at once.

A suit to break the newest jitney ordinance was filed with the County Clerk of Multnomah County, Portland, Ore., recently by A. A. Theilke, et al, against Mayor Albee. The complaint asks a temporary injunction restraining the city officials from enforcing the ordinance during the pendency of the suit. It is contended among other things that the measure is void because an emergency clause was attached, doing away with the right of the people to submit it to a referendum vote, and that it is class legislation because it requires a license fee, whereas taxicabs, hotel buses, sight-seeing cars, private automobiles and street cars do not pay a license and are not required to be examined regularly. Mayor Albee of Portland, Ore., has instructed the police department to enforce the provisions of the new jitney ordinance prohibiting the carrying of more than one passenger in the seat with the driver and prohibiting any person from riding on the running board, steps or doors of the cars.

Ordinances prohibiting the jitney buses from operating in the district bounded by Fourth, C, Sixth and E Streets, requiring them to maintain regular schedules and to stop on the far side of street intersections to let off and take on passengers, have been approved by Mayor Capps of San Diego, Cal. Being emergency ordinances, they became effective immediately. At the time he signed the ordinances mentioned the Mayor still had under consideration the ordinance requiring jitneys to operate eighteen hours a day six days a week.

The Auto Transit Association of Spokane, Wash., composed of jitney bus operators of the city, propose to test in court the city ordinances compelling jitneys to maintain a regular run for eight consecutive hours a day.

A new jitney ordinance is pending in Topeka, Kan., with additional restrictions which experience has indicated are necessary for the regulation of traffic and the protection of the public interests. Under this ordinance the license fee of \$10 payable semi-annually will be increased to \$25 for a five-passenger car, \$35 for a seven-passenger car and \$50 for cars seating more than seven. The fee must be paid in advance, and no part will be returned if the owner ceases business. No bond will be required. The windshield must bear indication that the car is a jitney, and must show the rates to be charged, which cannot be exceeded except by special agreement with passengers. Each licensed jitney must operate twelve hours a day. Any violation of the regulations of the license ordinance may cause revocation of the license.

CITY'S POWERS BROADER THAN COMMISSION'S

So Holds the West Virginia Public Service Commission in the Charleston Jitney Case

The Public Service Commission of West Virginia has dismissed without prejudice the petition of James Smith et al. charging certain jitney operators of Charleston with unlawful discrimination in the carriage of passengers, and has also similarly dismissed the petition of the Charleston Interurban Railroad charging the same defendants with unlawful discrimination, etc., and asking supervision and regulation of the jitney business in Charleston. In concluding its opinion the commission said in part:

"There is no just reason why the jitney bus business should not be subjected, like other common carriers of persons, to reasonable regulations.

"The Council of Charleston passed the jitney ordinance on June 28. Said ordinance makes it unlawful for any person, firm or corporation, either as principal, agent or employee, to use or occupy any public street in Charleston, with a motor vehicle, in the manner defined in the ordinance, without a permit or license. It imposes an annual license tax of \$24 for each vehicle, requires bond in the penalty of \$2,500, conditioned that the operator will not violate any of the provisions of the ordinance and that he shall pay any and all lawful claims for damages for injury to persons or property sustained by passengers in such vehicles, or by any other person or persons that may be killed or injured or suffer damages to property by reason of the operation of said motor vehicles. It requires the vehicles to be operated by experienced drivers; designates the section of the city where said vehicles shall operate, requires them to operate certain hours of the day and not less than six days in each week, and requires them to carry any and all persons, indiscriminately, that offer themselves for carriage and tender the fare. Said ordinance contains many other requirements and restrictions not hereinbefore enumerated, which said ordinance under the provisions of the charter of said city became effective July 28, 1915—five days after the hearing of these cases before the commission.

"The powers of regulation over the operation of the business under consideration, granted by the Legislature to the city of Charleston, are much broader than those granted the commission. In addition to this fact, the municipal authorities, under whose constant observation a business is being operated, can regulate, control and supervise said business far more effectively than can a board or commission not so situated. The petitions in this proceeding were both filed after the passage of the said ordinance but before it went into effect and before it could possibly be known whether or not the provisions of this ordinance would operate so as to furnish proper and adequate regulation of the jitney business. It should not be, and it is not, the intention of the commission to interfere with the local authorities in the regulation of purely local matters, over which the local authorities have full and complete jurisdiction and control.

"It would appear that inasmuch as the matters in controversy are purely local, and that the local authorities have ample regulatory powers over the operation of the business in question, and are now regulating said business, that this

commission should not interfere with the operation thereof, and that it should remain, for the present at least, under the supervision and control of the municipal authorities of Charleston.

"In regard to the complaint against defendants in refusing to carry passengers who were members of the colored race, the defendants by their answers have admitted that this was an unlawful discrimination and agreed to carry thereafter all persons, regardless of race, color or previous conditions of servitude. So, having conceded the relief asked for in this particular, it is unnecessary to enter into a discussion of this question.

"The commission is, therefore, of the opinion, for the reasons hereinbefore stated, to dismiss the petition of James Smith et al., and of the Charleston Interurban Railroad, without prejudice to the said petitioners to apply at any time in the future to said commission for redress of any grievances affecting them, or either of them, and it is accordingly so ordered. The commission does not deem it necessary at this time to promulgate any rules relative to the regulation of the jitney bus business."

COMMISSION WITHOUT POWER TO MODIFY FRANCHISE FARE PROVISIONS

The Public Service Commission for the Second District of New York has decided, in an opinion by Commissioner Frank Irvine, that it has no power to modify the terms of a franchise granted by a municipality. The New York & North Shore Traction Company, Flushing, Long Island, applied to the commission, asking that it determine that the just and reasonable fare between Mineola and Port Washington was 15 cents instead of 10 cents, to which the road is limited by the terms of its franchise granted by the Supervisors of Nassau County and the Highway Commissioners of the town of North Hempstead. The attorneys for the road contended that the power to grant franchises in a municipality was but a power delegated to the municipality by the Legislature and that the Legislature itself, or the commission, to whom the Legislature has delegated general power over rates, could amend the franchise. Judge Irvine in his opinion cited a clause in the constitution providing that no law granting a street railway franchise can be passed without the consent of the local authorities and the abutting property owners. He said that if the language of the public service commissions law giving the commissions power over rates were to be construed as giving the commission power to change the terms of a local permission, it would undoubtedly be unconstitutional.

SUCCESS OF BROOKLYN INSURANCE PLAN

More than 5200 employees of the Brooklyn (N. Y.) Rapid Transit Company had applied up to Sept. 15 for insurance under the plan of group life insurance which was announced to all the employees of the company on July 30. A notice has been sent to all employees that by arrangement with the Travelers Insurance Company, Hartford, Conn., through which the group contract is placed, the insurance will be effective upon all those who have applied for it at noon on Sept. 15. Out of approximately 8000 employees eligible for the group insurance, about 65 per cent filed applications within six weeks of the original announcement of the plan. Inasmuch as more than 5000 employees have applied for the insurance, there will be no necessity of the physical examination of these applicants. An arrangement has been made with the insurance company whereby those who are now eligible for the insurance as the result of having served two years in the employ of the company will be allowed until Jan. 1, 1916, to come into the group without physical examination. After Jan. 1, 1916, any employee who was eligible for the insurance prior to Sept. 15, 1915, will be admitted to the group only upon a physical examination. In the case of employees who become eligible for the insurance hereafter by the completion of their two years of service, the arrangement between the railroad company and the insurance company provides that such employees may be admitted to the group without physical examination if they apply for the insurance within six months after the date upon which they

become eligible for the same. Any who do not apply within six months after the date on which they become eligible for the insurance will be admitted to the group thereafter only upon physical examination. The applications received up to Sept. 15 which constitute the initial group involve an aggregate premium of more than \$56,000 a year. One-half of this is paid by the employees and one-half by the company. The terms of the insurance offer of the company to the employees were reviewed in the *ELECTRIC RAILWAY JOURNAL* of Aug. 7, page 252.

Safety First League for Louisville.—Plans for the organization of a safety first league, to be affiliated with the National Safety First Association, have been made in Louisville. Coroner Ellis Duncan started the movement, and railways, automobile and municipal authorities are participating in it. At a meeting held to discuss organization Coroner Duncan called attention to the great decrease in the number of accidents since the Louisville Railway began its safety-first work.

Electric Railway Scenarios Wanted.—The publicity department of the Illinois Traction System, Peoria, Ill., has announced the intention of having a moving picture made on the cars and in the stations of the company. In order to secure a plot that will work up into a good picture a contest will be held with prizes for the best stories submitted. The only thing taken into consideration will be the idea. If the scenarios warrant they will be turned over to some of the large picture houses to be worked up into a completed plot. A committee of Springfield newspaper men will pass on the stories and the announcement of the winners will be made after the State Fair. The successful stories will be published in papers throughout the State.

Collision at Corte Madera.—An electric train of the Northwestern Pacific Railroad consisting of three coaches and a steam train made up of three baggage cars with the engine reversed collided on Sept. 9 near the north portal of the tunnel at Corte Madera, Cal. Four persons were seriously injured and twenty others were slightly hurt. W. S. Palmer, president and general manager of the company, issued a statement in which he said: "The collision occurred on the only piece of single track on our suburban system. It is protected by automatic signals of the most approved type. The signals worked perfectly. The freight train got the signal that gave it the right of way through the tunnel, but for some inexplicable reason the motorman ignored the warning and went crashing into the freight train."

Mr. Dempsey Not Guilty.—Magistrate Dodd in the Adams Street Court in Brooklyn decided on Sept. 11 that John J. Dempsey, superintendent of transportation of the New York Consolidated Railroad (Brooklyn Rapid Transit System) was not culpable for disobeying an order of the Public Service Commission issued in 1912. On that date Mr. Dempsey was not manager of transportation and there was no evidence to show that any copy of the order had ever been served on him, was the basis for the ruling under which the official was freed on the misdemeanor charge. Mr. Dempsey was brought to the Fifth Avenue Court on June 5 last. Public Service Commissioner Hayward personally appeared against him. On Sept. 16 Mr. Dempsey was indicted by the Kings County Grand Jury on a misdemeanor charge in connection with his alleged failure to obey the order of the commission.

Pittsburgh Railways Folder at Pittsburgh Exposition.—The Pittsburgh (Pa.) Railways is distributing an extremely interesting folder at its exhibit space at the Pittsburgh Exposition. The scope of the folder is perhaps illustrated best by the table of contents which contains the following: "Some Things the Company is Doing to Improve Service," "Route Numbers," "Points of Interest in Pittsburgh and How to Reach Them," "Trolley Trips in and Near Pittsburgh," "Map of Pittsburgh and Vicinity, Showing Territory Served by the Company," "How to Reach Boroughs and Outlying Districts," "Washington and Charleroi Schedules," "Items of Cost," "Two Pittsburgh Railways Problems—the Rush Hour Traffic and Should Every Car Go to the End of the Line?" "Some Things the People Can Do to Improve the Service" and "Pittsburgh Railways Data in Round Numbers."

Personal Mention

Mr. Thomas B. Smith, candidate for Mayor of Philadelphia, appointed a month ago as a member of the Public Service Commission of Pennsylvania, has announced his resignation from the commission.

Mr. F. J. Stevens, formerly master mechanic of the Fort Wayne & Northern Indiana Traction Company, Fort Wayne, Ind., has been appointed master mechanic of the Lansing division shops of the Michigan United Traction Company, Jackson, Mich.

Mr. Ralph W. Emerson, who recently assumed his new position of assistant superintendent of the Cleveland (Ohio) Railway, is a son of Mr. Frank A. Emerson, sales agent of the same company. He received his preliminary education at Lincoln High School, Cleveland, and was a member of the class of 1906 at the Case School of Applied Sciences, Cleveland, having taken a combined mechanical and electrical engineering course. Immediately after his graduation he secured a position in the power department of the Cleveland Railway and in 1910 he was sent to Long Island to install and operate the power plant of the New York & North Shore Traction Company. Later on he was made general superintendent of the road, a position which he held until he assumed his present post on Sept. 1 last.

Mr. Herbert Markle, the newly-elected president of the West Virginia Public Utilities Association, which is made up of the electric light, power and traction, artificial-gas, water and telephone companies of West Virginia, is a native of Indiana and a graduate of the school of electrical engineering of Purdue University, class of 1895. Following graduation Mr. Markle spent a number of years with the Jenney Electric Company of Indianapolis and later went with the Northern Electric Manufacturing Company as district sales manager, with headquarters at Chicago. For a few months he also served with the Fort Wayne Electric Company after the consolidation of the Fort Wayne and the Northern Electric companies' interests. Six years ago Mr. Markle joined the Byllesby organization and for three years was stationed at Stillwater, Minn., as manager of some of the Northern States Power Company's properties. For the last three years he has been general manager of the Appalachian Power Company, stationed at Bluford, W. Va.

Mr. Edward J. Haines has been appointed assistant superintendent of equipment of the Bay State Street Railway, Boston, Mass. Mr. Haines was graduated from Columbia University in 1905 with the degree of E. E. After spending four months in studying electric railway work in Europe, in which he traveled 25,000 miles and visited the principal installations in Great Britain and on the continent, he was employed in the shops of the Brooklyn (N. Y.) Rapid Transit Company for a year. Prior to graduation he worked in the offices of Mr. C. O. Mailloux, consulting engineer, New York, and was also employed by the General Electric Company. Mr. Haines entered the employment of the Bay State company in 1906 as inspector at the Campello (Mass.) shop. He was later transferred to the main offices of the equipment department at 84 State Street, Boston, and has since had an active share in the engineering work of the office, including tests, expert testimony in court cases, investigations, and supervisory duties in close association with the head of the department.

OBITUARY

Sir William C. Van Horne, a leading figure in transcontinental railroad development in Canada, died at Montreal on Sept. 11. He was in his seventy-third year. Sir William was born at Joliet, Ill. He received his title and was created a Knight Commander of St. Michael and St. Gregory in 1904. He was instrumental in making the Canadian Pacific one of the greatest railway systems in the world. After the close of the Spanish-American war he caused 300 miles of railroad to be built in Cuba. In addition to his many Canadian interests Sir William was president of the Cuba Company and the Cuba Railroad. Among the positions from which he had retired recently were directorships at the Rio de Janeiro Tramway, Light & Power Company, Ltd., the Equitable Life Assurance Society, New York, and the Winnipeg (Man.) Electric Railway.

Construction News

Construction News Notes are classified under each heading alphabetically by States.

An asterisk (*) indicates a project not previously reported.

RECENT INCORPORATIONS

***Fort Wayne, Decatur & Southern Railroad, Decatur, Ind.**—Incorporated in Indiana to construct and operate an electric line between Fort Wayne, Decatur, Monroe, Berne, Ceylon, Geneva, Bryant, Portland, Winchester, Lynn, Fountain City, Richmond and all intervening towns. It is stated that this company has been organized to take over the property of the Fort Wayne & Springfield Railway. Capital stock, \$10,000. Incorporators: Charles Oetting, Martin Gerke, Charles Dirkson, Henry Aumann and John H. Koenig.

***Chester & City Point Railway, Chester, Va.**—Incorporated in Virginia to construct an electric line from Chester to City Point and Hopewell, crossing the Appomattox River at or near Point of Rocks. Capital stock, \$100,000; minimum, \$1,000. Officers: H. D. Eichelberger, Chester, president; A. C. Buchanan, Chester, secretary, and Willis B. Smith, Richmond, general counsel.

***Richmond & City Point Transportation Company, Richmond, Va.**—This company will soon be chartered to operate a trolley, steam and ferry line between Richmond and Hopewell. No new line will be built or equipment purchased. The Virginia Railway & Power Company operates a car from Richmond to Chester and the company has agreed upon terms of contracts with the Tidewater & Western Railway which operates between Chester and Bermuda Hundreds and with the Furman Steamship Line which will operate a ferry between Bermuda Hundreds and City Point.

FRANCHISES

Sacramento, Cal.—The Pacific Gas & Electric Company has received a franchise from the Council to construct an extension on T Street, Upper Stockton Road, Cypress Avenue, Lower Stockton Road, Curtis Avenue, Whiskey Hill Road, Palmetto Avenue, Fifth Avenue and East Avenue, Sacramento.

Waukegan, Ill.—The Chicago & Milwaukee Electric Railroad has received from the Council a ninety-day extension of time on its franchise, pending the preparation and accepting of a new franchise.

Georgetown, Mass.—The Bay State Street Railway has asked the Council for a franchise to relocate its tracks on West Main Street from the entrance to York Grove to the Boston & Maine crossing on West Main Street.

Albany, N. Y.—The United Traction Company has asked the Council for a franchise to construct and operate a single track line on Madison Avenue from Trinity Place to Grand Street and on Grand Street to Hamilton Street, Albany.

El Paso, Tex.—The El Paso Electric Railway will ask for a franchise to construct an extension of its lines on Piedras Street from Alameda Avenue to the Boulevard.

Seattle, Wash.—The Council has adopted resolutions directing Corporation Counsel Bradford to instruct the holders of the franchise of the Seattle-Tacoma Short Line to comply with all its terms, and in the event of failure to proceed with the construction, to forfeit \$13,500 deposited by them at the time their franchise was granted. (Sept. 4, '15.)

TRACK AND ROADWAY

Edmonton (Alta.) Radial Railway.—About 6400 ft. of permanent track is being laid by this company on Portage Avenue, Edmonton.

Phoenix (Ariz.) Railway.—An order has been issued by the corporation commission granting this company an extension of time until Nov. 1 to complete the construction of its railway loop on Monroe Street to Fourth Street and thence to Washington Street, and to abandon the Indian school line from a point between Third and Fourth Streets to the connection with the First Street line at Pierce Street.

Pacific Electric Railway, Los Angeles, Cal.—The Hermosa Beach Chamber of Commerce has taken steps to obtain a 5-mile right-of-way to build a railroad to connect with the line of the Pacific Electric Railway at Belvidere, thus leading into Los Angeles over the Gardena route. It is the intention of the Chamber of Commerce in case it is successful to donate the right-of-way to the Pacific Electric Railway for building the line. The proposed road would give two direct lines from Hermosa Beach into Los Angeles.

Quebec Railway, Light & Power Company, Quebec, Canada.—The Quebec City Council is considering steps to compel this company to extend its lines in Limoilou, Beauport and Charlesbourg.

Bristol & Plainville Tramway, Bristol, Conn.—This company will be asked to raise its tracks on North Main Street to conform to the grade necessary for the pavement about to be put down.

Connecticut Company, New Haven, Conn.—The Connecticut Company has awarded the contract for the grading for the new North End trolley line in Hartford to Lathrop & Shea, New Haven. The line will extend on Main Street, Grove Street, Broad Street, Washington Street, Farmington Avenue and Commonwealth Avenue.

Chicago, Ottawa & Peoria Railway, Joliet, Ill.—This company has awarded a contract to the Joliet Bridge & Iron Company for the construction of a bridge over the Vermillion River. The bridge will consist of two 26-ft. spans. The cost is estimated at \$3,800.

Peoria (Ill.) Railway.—Work has been begun by this company on the double-tracking of its line on Frye Avenue from Wisconsin Avenue to Pacific Avenue and Adams Street from Abingdon Street to Camblin Street. The tracks will be of heavy steel and laid in concrete. New track is also to be laid on North Monroe Street. The company has completed the work of laying new tracks on Second Avenue from Franklin Street to State Street.

Kankakee & Urbana Traction Company, Urbana, Ill.—Work has been begun by this company on its 5-mile extension from Ludlow to Paxton. It is expected to extend the line from Paxton to Kankakee.

Keokuk-Jefferson City Electric Railway, Keokuk, Iowa.—Surveys have been completed of this company's line from Keokuk to Jefferson City and right-of-way secured as far as Shelbyville. As surveyed, it will pass through Kahoka, Williamstown, LaBelle, Newark, Bethel, Shelbyville, Shelby, Paris, Long Branch, Mexico and Fulton. H. W. Knight, Chicago, is interested. (June 5, '15.)

Salina-Northern Railroad, Salina, Kan.—This road has been completed from Salina to Lincoln Center, 35 miles. An extension is being built to Corinth and Downs, 43 miles, and a branch from Corinth to Osborne, 10 miles. (Aug. 21, '15.)

Idlewyld Park Railway, Baltimore, Md.—Work will soon be begun by this company on the construction of its 1-mile line on Regester Avenue from the York Road to Idlewyld Park. This road will connect with the line of the United Railways & Electric Company. Harry E. Gilbert, 2 East Lexington Street, Baltimore, president. (July 31, '15.)

Springfield (Mass.) Street Railway.—Plans are being made by this company to relocate its tracks on Mill Street, Springfield, from West Silver Street to Court Street, from the center to the west side of the street.

American Traction Company, Minneapolis, Minn.—It is announced that the street and interurban railway connecting International Falls with Ranier, South International Falls and other points in the district has just been completed. A. L. Sorter, Minneapolis, president.

Electric Short Line Railway, Minneapolis, Minn.—This company has awarded a contract to H. F. Balch & Company, Minneapolis, for the construction of its 45-mile extension from Winsted to Hutchinson, via Silver Lake.

Nevada, Lebanon & Eastern Railroad, Nevada, Mo.—Plans are being revived for the construction of this company's proposed line between Lebanon and Nevada. Plans for financing the enterprise were interrupted when the St.

Louis & San Francisco Railroad went into receivership, several of its stockholders having been interested in furnishing capital for the new road. Several counties raised large bonuses, the notes being dated to expire in July, 1916. The subscribers will be asked to renew their pledges. S. W. Thompson and Andrew Thompson, Kansas City, are interested. (Jan. 25, '13.)

St. Louis, Lakewood & Grant Park Railway, St. Louis, Mo.—Members of the Lakewood Improvement Association of Lakewood, a suburb west of Gravois Avenue, are considering the question of urging this company to resume operating its cars between Gravois Avenue and Lakewood. The railroad has not operated since the flood of Aug. 20, which undermined the tracks in places along the River des Peres.

*Nye, Mont.—Surveys have been begun for a proposed electric railway from Nye to Cooke City to provide transportation for minerals. Mayor E. A. Gerhart, Billings, is interested.

New York Consolidated Railroad, Brooklyn, N. Y.—This company has notified the Public Service Commission for the First District of New York that it will be ready to place in operation by Sept. 17 the local tracks in the Fourth Avenue subway from Fortieth to Fifty-ninth Streets. If the commission orders the use of the local tracks the operation from Fortieth Street on will be over them instead of the express tracks as heretofore and this will allow stops at the local stations at Forty-fifth and Fifty-third Streets. Through operation over the express tracks is still prevented by the reconstruction work at the DeKalb Avenue station where crossovers between express and local tracks are being installed.

*Catskill, N. Y.—Plans are being considered by a Brooklyn syndicate for the construction of a railway from Catskill to Richfield Springs, via Middleburg.

Federal Light & Traction Company, New York, N. Y.—E. H. Sanderson, president of this company, which operates the local urban and interurban lines in Hoquiam and Aberdeen, Wash., states that the company contemplates the construction of a line between Willapa Harbor and Grays Harbor. It is estimated that the cost of this improvement will be about \$1,000,000.

New York State Railways, Rochester, N. Y.—During the current year this company has expended \$147,819 for betterments, renewals and replacements. The sum of \$27,181 was spent in August for the same purposes.

Troy & New England Railway, Troy, N. Y.—This company, operating between Troy and Averill Park, suspended operations on Sept. 7. The road is leased by the Delaware & Hudson Company.

Tiffin, Ohio.—A bond issue of \$2,000 has been asked from the Chamber of Commerce of Tiffin toward the cost of making a preliminary survey for the electric railway to be built between Tiffin and Bucyrus. A. W. Nyquist is interested. (July 17, '15.)

Cleveland, Painesville & Eastern Railroad, Willoughby, Ohio.—A report from this company states that it expects to rebuild 2½ miles of track. An order has been placed with the Lackawanna Steel Company for 500 tons of 70-lb. A. S. C. E. rail, 300 tons to be delivered at once.

Youngstown & Southern Railway, Youngstown, Ohio.—In return for certain right-of-way along its tracks for the southern district sewer, this company has asked the city to allow it to lay a double track from South Avenue to its station on Front Street, east of Market Street. The Council is in favor of permitting the double-tracking, but claims it has no authority to grant such permission, which must be gained from property owners along the right-of-way.

Southwestern Power, Light & Railway Company, Oklahoma City, Okla.—W. T. Croslen, president of this company, which is to build an interurban railway from Oklahoma City to Denison, Tex., via Sulpher, Okla., has announced that work on the hydraulic electric plants will begin in October. Work was begun on the line some time ago, but, after considerable grading, was discontinued. Three large water plants will be constructed at a cost of \$1,000,000. The power plants will aggregate a total of 75,000 hp.

*Tulsa (Okla.) Traction Company.—This company, which was recently incorporated in Oklahoma with a capital stock of \$100,000 to succeed the foreclosed Oklahoma Union Traction Company, reports that a line will be built from Tulsa to Sapulpa, Collinsville, Bixby, Broken Arrow and Okmulgee. The company operates 6 miles of single track and reaches Orcutt Lake. Power is purchased from the Public Service Company of Tulsa. Officers: G. C. Stebbins, president; A. J. Biddison, vice-president; I. F. Crow, secretary, and B. C. Redgraves, superintendent, all of Tulsa.

Johnstown & Somerset Street Railway, Johnstown, Pa.—According to Engineer Wilbor of the J. A. Vandergrift Company, New York, which is financing and building the line from Johnstown to Rockwood, the catenary overhead system will be used to operate the road. Rails of not less than 70-lb. will be used. A block signal system will also be installed. [July 17, '15.]

Chambersburg, Greencastle & Waynesboro Street Railway, Waynesboro, Pa.—It is reported that this company is contemplating the construction of an extension from Blue Ridge Summit to Thurmont or Emmitsburg, 8 or 10 miles.

Chester & City Point Railway, Chester, Va.—Preliminary surveys have been made of this company's line from Chester to City Point and Hopewell and it is expected to have the line completed by next spring. H. D. Eichelberger, Chester, president.

SHOPS AND BUILDINGS

Pacific Electric Railway, Los Angeles, Cal.—A contract has been let by this company for a new freight depot on F Street, between Second and Third Streets, San Bernardino. The structure will be of reinforced concrete and will contain offices for the various freight and passenger officials. The cost is estimated at \$20,000.

Norwich & Westerly Traction Company, Norwich, Conn.—This company has removed its main carhouse from Hallville to the one on Beach Street, Westerly. All the repairing will be done at the carhouse on Beach Street, the one at Hallville being used only for painting and storage.

Chicago & Milwaukee Electric Railroad, Chicago, Ill.—This company will build a new station in Waukegan where the new city line joins the west tracks of the through line.

Interborough Rapid Transit Company, New York, N. Y.—The contract for station finish on the Jerome Avenue and White Plains Avenue lines, Bronx, has been awarded by the Public Service Commission for the First District of New York to the Altoria Realty & Construction Company for \$860,363.

POWER HOUSES AND SUBSTATIONS

Menominee & Marinette Light & Traction Company, Menominee, Mich.—A report from this company states that it expects to purchase a feeder panel for its power house and material for 6 miles of transmission line.

Elmira Water, Light & Railroad Company, Elmira, N. Y.—A report from this company states that it expects to place contracts during the next three weeks for three 500-kw., 6600-230-volt transformers, three 1500-kw., 6600-230-volt transformers, two complete substations and lead-covered cable.

New York State Railways, Syracuse, N. Y.—This company reports that it has purchased one 1000-kw., six-pole, 600-volt, d. c., 25-cycle, 500-r.p.m. rotary converter from the General Electric Company; also three 350-kva., 11,000-430-volt O. I. S. C. transformers to be used for its Tracy Street substation.

Salt Lake & Ogden Railway, Salt Lake City, Utah.—This company will purchase a 400-kw., d. c. motor generator set for installation at its substation at St. Joseph.

Charleston Interurban Railroad, Charleston, W. Va.—A report from this company states that it plans to purchase three 300-kw., 750-volt rotary converters.

Ashland Light, Power & Street Railway, Ashland, Wis.—Plans are being made by this company to construct a 1500-kw. turbine plant in Ashland. The Wisconsin Railroad Commission has authorized the sale of \$100,000 of first mortgage 5 per cent bonds at not less than 75 per cent to defray the cost of building the plant.

Manufactures and Supplies

ROLLING STOCK

Brantford (Ont.) Municipal Railway expects to purchase one snow sweeper.

Port Arthur (Ont.) Municipal Railway is building a combination snow plow and broom in its shops.

United Traction Company, Albany, N. Y., expects to issue very shortly specifications for fifteen new cars.

Springfield (Mass.) Street Railway has ordered one prepayment car from the Wason Manufacturing Company.

Charleston (W. Va.) Interurban Railroad expects to purchase within the next thirty days one 45-ft. express and freight car.

Havana Central Railroad, Havana, Cuba, has ordered an additional 60-ton electric locomotive from the General Electric Company.

Lincoln (Neb.) Traction Company, Lincoln, Neb., has purchased one single truck snow plow from the McGuire-Cummings Manufacturing Company.

Cassville & Western Railroad, Cassville, Mo., expects to purchase within the next few months a passenger and baggage car and possibly an electric locomotive.

San Francisco-Oakland Terminal Railways, Oakland, Cal., is working on specifications for twelve new cars for its Key Route. The date on which bids will be called has not yet been decided, but probably will be about Oct. 1. The cars are to be of the pay-as-you-enter type with side entrance and low step.

Cleveland (Ohio) Railway Company has ordered from the G. C. Kuhlman Car Company eighty new cars of the front-entrance, center-exit type, equipped with Westinghouse motors. The cars are duplicates of the fifty cars recently purchased. This company is also rebuilding fifty cars which have front and rear platforms, into the front-entrance, center-exit type. The new and the rebuilt cars, together with those now in service, will make a total of 180 cars of the front-entrance, center-exit type operated by this company.

TRADE NOTES

M. H. Hovey, Consulting Signal Engineer, has changed his address to 119 West Main Street, Madison, Wis.

Pyrene Manufacturing Company, New York, N. Y., has received a gold medal award at the International Exposition at San Francisco.

Arthur E. Duclos has been made representative in charge of the new Chicago office of the Standard Woven Fabric Company, 327 South La Salle Street, Chicago, Ill.

E. R. Mason Company, Inc., New York, N. Y., announces that it is no longer acting as Eastern sales representative for the Hunter Illuminated Car Sign Company, Flushing, N. Y.

American Steel & Wire Company, Chicago, Ill., has been awarded a Grand Prize by the Panama-Pacific International Exposition for the superiority of its products and the high character of its exhibit.

F. B. Cutter Company, 50 Church Street, New York, announces that it has been appointed exclusive selling agent for the many double and single truck open and closed cars recently retired from service by the Third Avenue Railway, New York, N. Y. F. B. Cutter, general manager, was formerly with the General Electric Company and has been for a number of years engaged in the machinery business.

Western Electric Company, New York, N. Y., has received an order from the Ogden, Logan & Idaho Railway, Ogden, Utah, for one complete train-dispatching system, including thirty way-station equipments, dispatcher's outfit and attendant telephone sets and material. The railway company feels that the new system will solve its dispatching problems and serve to increase its transportation facilities.

Roller-Smith Company, New York, N. Y., has added to its list of agents the Conant Electric Company, Equitable Building, Baltimore, Md. The Conant Electric Company will handle Roller-Smith instruments and circuit breakers and Columbia meters in the territory comprising the States

of Maryland, Virginia, North Carolina, part of West Virginia and the District of Columbia. Associated with S. M. Conant is C. L. Ball, both of whom are well known in this territory.

U. S. Metal & Manufacturing Company, New York, N. Y., has appointed Walter H. Evans of Chicago as Western railroad department manager. Mr. Evans was recently manager of the motor gear department of the Edgar Allen American Manganese Steel Company, Chicago, and previous to his connection with this company was connected with several electric and steam roads in the capacities of master mechanic and superintendent of motive power. Mr. Evans will make his headquarters in the McCormick Building, Chicago, Ill.

Westinghouse Electric Export Company at a meeting of its board of directors in New York on July 28 elected the following officers: President, E. M. Herr; vice-president, L. A. Osborne; vice-president, Calvert Townley; managing director, Maurice Coster; secretary, J. C. Bennett; treasurer, H. D. Shute; auditor, F. E. Craig; assistant secretary and assistant treasurer, W. H. Jones. In addition the president announces the appointment of the following officers: Manager, E. D. Mills; European manager, E. R. Ellis; assistant export manager, H. F. Griffith.

Monarch Refillable Fuse Company, Buffalo, N. Y., has purchased 150 ft. of frontage on Leslie Avenue, running north from East Ferry, Buffalo, for the construction of a new factory, which includes a new experimental laboratory for the electrical devices which this company will manufacture. The new factory will not only give the company ample space for taking care of the greatly increased refillable fuse business, but will also give enough space to install its new machinery and equipment to manufacture, under recent patents issued to the vice-president of the company, the new Monarch soldering iron.

Esterline Company, Indianapolis, Ind., manufacturer of "Golden Glow" headlights, has secured a complete equipment order from the Chicago, Lake Shore & South Bend Railway, Michigan City, Ind. These headlights are of the recessed dash interurban type with flange which enables them to be mounted in the present headlight cases on the hood of these cars, without making any construction change whatsoever. They will use 6-volt, 18-amp. Mogul base concentrated filament bulbs, which in test enable observers to see a man on the track at a distance of from 950 to 1100 ft. and pick up signal and whistle posts at a distance of nearly one-half mile.

S. K. F. Ball-Bearing Company of Hartford, Conn., with a capitalization of \$2,000,000, was incorporated on Sept. 4 for the manufacture and sale of ball bearings. The S. K. F. ball bearing has been handled in this country since 1910 by the American S. K. F. Ball Bearing Company, a selling organization for the Aktiebolaget Svenska Kullagerfabriken, Gothenburg, Sweden. An 8-acre site has been secured in Hartford and the erection of the first building will be shortly begun. It is intended to start the plant with about 300 men who will be able to produce only a part of the bearings sold in this country, the remainder for a time being imported. The Swedish factory has grown since 1907, when 100 men were employed, until at present 3000 are employed in the home factory exclusive of employees in European branches. The special Swedish crucible steel, known as S. K. F. steel, used by the parent concern, will be imported for use in the American-made bearings. The parent concern is placing its experience, special machines and all manufacturing facilities at the disposal of the American company.

NEW PUBLICATION

The Railway Library, 1914.—Compiled and Edited by Slason Thompson. Bureau of Railway News and Statistics, Chicago, Ill. 370 pages. Cloth, \$1.

This volume contains the sixth series of addresses and papers on railroad subjects, delivered or published during 1914. The articles cover such topics as valuation, taxation, railway mail pay, government ownership, and the like. Considerable space is devoted to the part railroads are playing in the present European war. The concluding section consists of the annual report of the Bureau of Railway News and Statistics, in which is presented the latest financial and statistical information in regard to American and foreign railroads.

Electric Railway Journal

Published by the McGraw Publishing Company, Inc.
Consolidation of STREET RAILWAY JOURNAL AND ELECTRIC RAILWAY REVIEW

Vol. XLVI

NEW YORK, SATURDAY, SEPTEMBER 25, 1915

No. 13

SAVINGS OF ELEC- TRIFICATION

The latest report of the Norfolk & Western Railway is conspicuous for its statement in regard to the advantages that have accrued from the company's recently-completed electrification of its coal-gathering division in the famous Pocahontas region of the Alleghenies. In this President Johnson says that the traffic results already obtained from the substitution of electricity for steam "indicate that the capacity of the line has been doubled and that the operating cost per ton-mile will be materially reduced." Inasmuch as the cost of the electrification, including the period of trial operation, was \$3,100,000 and the electrified route mileage 29.5, it is evident that these remarkable savings have been brought about through an expenditure of but \$100,000 per mile. This route, it should be remembered, includes a great number of colliery sidings, passing tracks and yards which make the cost per track-mile something like \$30,000. This is a truly negligible expenditure for doubling the capacity of a line through mountain country, especially when the same expenditure reduces operating expenses.

STARTING RESISTANCE OF ELECTRIC CARS

That the high starting resistance of railway cars is negligible in its effect on energy consumption has apparently been pretty thoroughly demonstrated, a very comprehensive review of this phase of the subject having been published in a recent communication signed by F. E. Wynne. The circumstances leading to this condition might be outlined by citing the fact that the change from a state of rest to one of motion which occurs when a street-car controller is moved to the first notch is, for all practical purposes, made instantaneously, and as time plays an equal part with force in the measurement of energy it is safe to neglect consideration of the friction of rest in so far as it affects the heating and the energy consumption of street car motors. However, as Mr. Wynne points out, there are certain cases wherein more data regarding starting resistance are greatly desired. One of these is where the motors are loaded up to the limit of their starting torque, as for example, in starting a freight train on a grade. Another is that very little information is available in regard to the apparent great increase of the starting resistance of motor cars over that of trail cars, either freight or passenger. Professor Ewing's tests on one particular car, published in the issue of Aug. 14, indicated the increase to be more than 100 per cent, and if this is to be the general rule more evidence regarding the fact and the reasons for it would be well worth digging out.

STANDARDIZA- TION IN CAR DESIGN

The communication by N. W. Storer on the subject of low-priced rolling stock, which appears elsewhere in this issue, as well as the recently-published letter of Ernest Gonzenbach, are notable contributions to a matter that ought to be of gravest interest to the electric railway industry. Both of our correspondents are in accord on the main point at issue, and this is that standardization in car design is a reasonable possibility and would be highly profitable. Their differences are on the reasons that have prevented the introduction of standards and may, perhaps, be caused to some extent by their different viewpoints. Be that as it may, electric railway car design is paying a daily penalty for its practical barrenness of standards, and with all the advantages of close organization which the industry possesses, this is rather a serious indictment. Of course, the adoption of standards does not mean that a single complete design with fixed over-all dimensions must be agreed on and adhered to until the end of time. In fact, as was pointed out in the ELECTRIC RAILWAY JOURNAL for Sept. 12 and Oct. 31, 1914, there are many details, such as side-post spacing, roof contours and the like, which need little more than official action for their standardization.

THE CONVENTION PROCEEDINGS

As a complement to the convention issue of the ELECTRIC RAILWAY JOURNAL which formed the second section of last week's issue, a convention report number will be mailed on Oct. 9. This will be the first full report of the convention proceedings available, and it will contain even an account of the exercises held in connection with the presentation of a commemorative plaque by the exposition company to the association on Friday afternoon, Eastern time. The discussion will necessarily all be sent by telegraph, the two sections of the editorial staff working in synchronism at the ends of the line. This will be no new experience for the editors, as each week's news is printed as received nearly up to mailing time. In the meantime Secretary Burritt has sent out a large assortment of reports and papers enabling the unfortunate ones who cannot attend the convention to digest them and to prepare written contributions to the discussion. It is especially important this year that such contributions be sent to the convention, as many of those who usually participate actively in verbal discussion cannot be present. Such unsolicited communications are the surest indication of vital and unselfish interest in the association of which the convention is such an important element. There is still time to send written discussions.

**THE IDEAL
ELECTRIC
LOCOMOTIVE**

The outline specification for an ideal electric locomotive, which was included by E. H. McHenry in his paper before the International Engineering Congress this week, supplies much food for thought. This is not only because of its suggestions as to the imminence of a widening of the speed range at rating for electric engines and of a system for multiple-unit control for freight trains, but also because of the timely emphasis that is laid upon the necessity for reducing track loads. Mr. McHenry proposes to limit the weight on each driving axle to 20 tons, although maintaining a tractive effort of 10,800 lb., and in so far as the latter figure is concerned it is within easy reach to-day because this proportion of weight and power has been practically equalled already. With regard to the proposed weight limit per axle it would seem that this is a problem solely of mechanical design which ought to be met without difficulty. Certainly there is every reason for its establishment, as there is no question but that the strength of the roadway has by no means kept pace with the loads that have been placed upon it by the monster rolling equipments of the past few years. The rail, indeed, bids fair to-day to constitute an effective obstacle to further growth in rolling stock design, and as the electric locomotive can successfully surmount this by reducing wheel loads it would seem only logical to establish weight limits now and thus take at least one step toward the ideal machine that Mr. McHenry describes.

THE P. R. R. PHILADELPHIA ELECTRIFICATION

The unobtrusive manner in which electric operation has been inaugurated in suburban service on the main line of the Pennsylvania Railroad out of the Philadelphia terminal is characteristic of the gradual nature of the electrifications of the future. The railroad operating department realizes the change when electric are substituted for steam locomotives, or multiple-unit trains are added to the equipment, and the engineers of the country are interested to note the passing of another milestone on the path of progress, but otherwise the event attracts little attention. The travelers directly benefited appreciate the freedom from smoke and dust, but one trip accustoms them to the new conditions. The general public is as little concerned with the Philadelphia electrification as it is with many another great but non-sensational event in industrial progress. The Pennsylvania Railroad has been fortunate in not being subject to external pressure in electrifying so that time could be taken to eliminate the defects in the equipment before beginning full operation. There has, therefore, been no haste in the work and even yet but a single train is running. That this is wise is evident from an inspection of the overhead construction in the yard where a bewildering network of contact, messenger and span wires was necessary to electrify the numerous tracks, cross-overs and switches.

When one realizes that not only must the contact wires be held in place but they must be insulated for 11,000 volts with a liberal factor of safety he gains an

appreciation of what has been accomplished in Philadelphia. If "overhead" can be kept in place and insulated under these conditions it can be kept so anywhere. While a very light electric service is to be furnished for the present the overhead for the entire terminal is completed so that it will be a comparatively simple matter to extend it. For this reason and also because the present construction is the result of exhaustive experiments superimposed on the accumulated experience from other electrifications we regard the Philadelphia electrification as far more significant than the present extent of the service would indicate.

THE LONDON TRAFFIC SITUATION

The urban transportation system in London, England, is one of the most interesting that there is for a number of reasons. One is on account of the magnitude of the problems in the world's largest city. Another is that owing to the clay foundations and liberal parliamentary enactments, the construction of underground railways is comparatively inexpensive, and, in consequence, the city has more miles of underground roads than any other. A third reason is the great development of motor-bus transportation, and its sharp competition with tramway service. Another is the fact that several of the trunk-line railroads entering London divert their suburban trains or part of them from the regular terminal stations and send them into the city through the rapid transit underground railways. They thus relieve these stations from the large commuter traffic and use the rapid transit system for distribution just as several of the outlying electric lines near Chicago use the elevated system in that city as a terminal and as the Arnold commission recommended in the case of the steam roads in that city. Still another reason why the London traffic situation is interesting to American readers is because Sir Albert Stanley, managing director of the London Underground Electric Railways Company, Ltd., and of a large proportion of the other transportation systems, spent many years in this country as a transportation manager. It is the problems connected with these systems which Sir Albert discusses in a paper presented at the International Engineering Congress at San Francisco this week.

The recommendations made in Sir Albert's paper are of interest to American as well as to British readers. Without going into the financial and legal aspects of the situation deeply it might be said that not only is the ownership of the traffic facilities in diverse hands but their regulation by the authorities is similarly diverse. Parliament, the Board of Trade, the County Council, the authorities of the municipal and suburban districts, the chief commissioner of police of the Metropolitan area, and the abutting property owners or "frontagers" on a proposed route, each have something to say or some veto power in regard to the construction or operation of one or more of the three principal means of transit, namely, railroad, tramway and bus. The necessary solution, in Sir Albert's opinion, is the establishment of an independent traffic board with jurisdiction over all of the means of transit with power to act,

as was recommended by the Royal Commission on London Traffic in 1907. It is interesting to remember that this recommendation of the Royal Commission was based largely upon a study of American conditions of State regulation, especially in Massachusetts and New York, where large powers had been given to the Transit Commission in Boston and the Rapid Transit Commission in New York. Finally, the paper discusses the question of fares and reaches the conclusion that with the low fares now charged on the London transit systems, and seemingly necessary owing to the British system of coinage, an expansion of traffic is imperative. This, however, is not out of the question, as a comparison of the rides per capita in Greater London, at present 271, with those in Greater Berlin, 293, and those in Greater New York, 338, shows. To pay 4 per cent on the capital now invested in the London urban railways, that is, to realize a net earning value of £1,390,000 more, after allowing for increase in expenses, requires an additional thirty-six rides per capita at the present average receipts per passenger, and this, under the circumstances, does not seem impossible.

THE NEW BEDFORD & ONSET FARE INCREASE

The fare increase granted by the Massachusetts Public Service Commission to the New Bedford & Onset Street Railway in a decision abstracted elsewhere in this issue is another gratifying indication that the right of capital to a reasonable return is receiving important and continued official acknowledgment. Here was a solvent property unable even with unusually skillful and economical management to earn more than a meager return upon the investment, amounting in fact to only 3 per cent in declared dividends on four occasions in the company's history of fourteen years. With about 44 miles of single track and a permanent tributary population of 20,366, the road has been conducted on a self-supporting basis but has been unable to set aside a sufficient depreciation fund from earnings or to afford more than a pittance of reward to those who put their money into the property. In fact, the owners have waited ten years after the last increase in rates for traffic to develop to the volume requisite to compensate their faith in the enterprise.

Readers of the abstracted decision cannot but be impressed with the remarkably clean bill of health which the commission gave the management in its thorough inquiry into the handling of the property from its inception to the end of the 1915 fiscal year. Running through the finding one notes the constant efforts of the management to control expenditures and to increase revenue by every legitimate means. The company's new arrangements for power supply from the New Bedford (Mass.) central station company, with provision for the resale of energy above its own requirements to the Marion Gas Company are a bit unusual in their economic advantages. These and the policy of having car painting done and of purchasing supplies economically at the shops of the Union Street Railway in New Bedford and the advantageous traffic arrangements and executive direction common to the two companies were

regarded by the commission as evidences of careful management. Few cases before the board have afforded so little ground for adverse criticism of methods of handling the property, and the clearly demonstrated inability of the company materially to increase its net earnings by further reduction in expenses was no mean factor in the commission's favorable decision, based as it was upon a minute and extended analysis of operations.

It is noteworthy that under the new rates the cash fare over the main line from Fairhaven to Monument Beach will be 48 cents, or 2.18 cents per mile, and that with the tickets to be sold at twenty for \$1, this rate per mile becomes 1.8 cents. On the route from Middleboro to Monument Beach the cash fare will now yield 1.69 cents and the ticket rate 1.41 cents per mile. The commission allowed a main-line rate of 1.67 cents per mile in the recent Blue Hill Street Railway case and 1.75 cents on the Norfolk & Bristol road. It has been pretty well exploded now that a rate of 1 cent per mile or even of 1.25 cents will meet the financial needs of a carefully managed road of the rural and semi-interurban type such as the New Bedford & Onset and many other lines in Massachusetts, and after all, the per mile rates mentioned are fairly low in comparison with the cost of transportation by other agencies. The commission wisely refuses to carry the per mile comparison too far, however, in view of the difficulties of harmonizing the differing zone lengths on the so-called main line and Middleboro branch, and in its conclusions properly treats the road as a complete entity.

Time will be required to show the effect of a 6-cent fare unit on the traffic in the New Bedford & Onset territory, as in other cases. It is hoped that about \$20,000 more revenue per year will result from the changes in rates, but the commission points out that if due provision is made for depreciation, the company can hardly realize a 6 per cent return on its investment even if the falling off in traffic as a result of the 6-cent unit is small. The probabilities are that in no great length of time the communities affected will respond to the increased rate without more than a temporary lack of patronage. Certainly the large summer population served in the Buzzards Bay district is unlikely to balk at the change in view of the thoroughness with which its necessity has been set forth by the commission, and the sale of tickets on the reasonable terms offered is sure to commend itself to both regular and summer patrons, although the proportion of cash fare passengers will doubtless decrease, at least temporarily, following the inauguration of the new rate.

Space will not permit further discussion of the case other than the remark that it called for a valuation by the commission's engineering staff, in view of the acquisition of a part of the property in past years on terms resulting from a receivership on that section of the system. The engineering and accounting studies made by the commission in these fare cases are valuable features of the proceedings, and throw not a little light upon the standards of technical administration which the board views with favor.

The Portland & Lewiston Interurban

This 40-Mile Line, Which Has Recently Been Put in Operation in Maine, Was Built Without the Issue of a Single Bond or Share of Stock

A year ago on July 2 a new high-speed electric line was opened for service between the cities of Portland and Lewiston, Me., by the Portland & Lewiston Interurban. The road is single track, occupying a private right-of-way about 30 miles in length and 50 ft. wide, its terminal connections covering 5 miles more in the cities of Portland, Auburn and Lewiston. The road was built without the issuance of a single bond or share of stock by Messrs. Libbey and Dingley of Lewiston, about four years being required for completion. Work was carried on only during the open season, with suspension of construction operations during the winter. The road provides an air-line route between its terminals and offers the public a schedule of one hour and fifteen minutes with ten stops over the 35 miles between Monument Square, Portland, and Lisbon Street, Lewiston, compared with a running time of three and one-half hours via the Portland-Brunswick trolley route. The running time between terminals in the center of each town is about the same as that of the Maine Central Railroad, and the fare on the new interurban is 75 cents, compared with 90 cents on the steam road.

RIGHT-OF-WAY

The track is of 70-lb. open-hearth T-rails laid in 33-ft. lengths with staggered joints and twin terminal copper bonds of American Steel & Wire Company's make. The company uses Duquesne joints, and the ties are of chestnut, 8 ft. 6 in. long, 6 in. x 8 in. in cross-section and laid 24 in. apart on centers. The conductivity of the bonds is equivalent to 2 ft. of rail. Gravel ballast was used throughout the private right-of-way. About 1 mile of the company's own line is located on the highway. The maximum grade is 4 per cent and the sharpest curve is 780 ft. in radius. Tie

plates are used throughout. Eight reinforced-concrete bridges were built for the road, the largest being 200 ft. long, over the Presumpscott River. Two of the other bridges are 100 ft. long each. They were designed by Fred T. Ley & Company of Springfield, Mass., who also supervised their erection. All cattle passes on the road are of reinforced concrete, the pass being fenced by wire close to the top of the fill.

POWER SUPPLY

The power supply for the cars is 650 volts direct current, distributed from three rotary converter substations, located at Danville, Gray and West Falmouth. The generating plant is located at Deer Rips, on the Androscoggin River, and is supplemented by a steam turbine auxiliary station in Lewiston, both of these installations belonging to the electric service company of Lewiston and Auburn, which is owned and operated by the Androscoggin Electric Company. From Lewiston to Danville substation, a 10,000-volt, 60-cycle, three-phase line of No. 1 copper is used on account of the desirability of transmitting current at moderate voltage through Lewiston and Auburn, which occupy opposite shores of the Androscoggin River. At the Danville substation the pressure is raised to 33,000 volts for transmission to Gray and West Falmouth, this line also

PORTLAND & LEWISTON—ROUTE OF RAILWAY WITH CONNECTING LINES

being a three-phase installation with No. 2 copper conductors mounted on pintype insulators and supported on 40-ft. chestnut poles. The 33,000-volt conductors are installed in a 42-in. equilateral triangle and the 10,000-volt line conductors have a 24-in. spacing. The transmission poles are set 6 ft. deep and are separate from the poles carrying the trolley brackets. No ground wire is installed. The high-tension lines loop through the intermediate substations.

The Danville substation contains a 300-kw. rotary converter, three 100-kw. step-down transformers and three 200-kva. step-up transformers feeding the high-tension line, with the usual oil switches and lightning arrester equipment. The apparatus is housed in a brick building 27 ft. x 40 ft. in plan, with a single operating room 20 ft. high. The roof is of mill construction,

pitched toward the rear, and the floor is of concrete. The 10,000-volt line from Lewiston enters the substation on the north side, passing through choke coils and terminating on horizontal buses carried on a pipe frame at the rear of the operating room. Taps are taken from these buses through disconnecting switches to automatic oil switches, one set being provided for each transformer bank. From the transformer secondaries in one bank leads are run under the floor in conduit to the rotary, low-voltage switching connections being provided on a rotary starting panel near the main switchboard. The other transformer secondary connections

PORTLAND & LEWISTON—CATENARY TROLLEY ON CURVE

PORTLAND & LEWISTON—TYPICAL TANGENT TRACK

lead out of doors to the southbound 33,000-volt line, electrolytic lightning arresters being mounted on the floor of the substation on the south side of the operating room. Horn-gap arrester connections are made outside the building, and the outgoing high-tension lines are hooded as they pass through the wall and attached to insulators on a cross-bar before being carried to the ordinary line poles, to insure increased mechanical stability. The second high-tension line shown in one of the illustrations is a power and lighting circuit having no connection with the railway service.

The main switchboard in the Danville substation consists of three panels. One of these is devoted to the direct-current side of the rotary converter and contains the usual equipment of a railway feeder panel. The others carry the oil switch handles, overload relays and ammeters required in handling the 10,000-volt circuits within the building, no oil switches being provided on the high-tension sides of the transformers feeding the line leading to the Gray and West Falmouth substations, although disconnecting switches are installed with the substation, and at the other substations this line may be cut open by oil switches. Electrolytic lightning arresters are also provided for the incoming 10,000-volt line at Danville. The rotary is started on 320 volts. The 10,000-volt oil switches are mounted in concrete cells occupying a total space of 5 ft. x 3 ft. 4 in. x 8 ft. 6 in., a clearance of 31 in. being allowed between the wall and the switch cells on the east side of the substation. Short levers connect the oil switch handles on the front of the main board with the cells, as shown in the interior view. The substation is lighted by twenty 16-cp. lamps mounted along the wall 10 ft. above the floor. Each of the other substations contains a 300-kw.

rotary and three 100-kw. step-down transformers. General Electric equipment is used throughout. The Gray substation is 8 miles from that at Danville and the West Falmouth substation is 7½ miles south of Gray.

OVERHEAD CONSTRUCTION

The trolley is installed with catenary suspension. To save line material the messenger wire is a No. 0000 copper conductor used as a feeder, the trolley, which is also of No. 0000 size, being attached to it by sherardized steel hangers 30 ft. apart. The trolley poles are 30 ft. long and are of chestnut, the spacing being 120 ft. Bracket suspension is employed, the messenger wire being laid upon porcelain insulators attached to 3-in. I-beams 8 ft. long, the bracket being stiffened by a 7/8-in. steel tie rod clamped to the pole. On curves a pull-off rod is used between the trolley and the bracket, as illustrated in one of the cuts. The use of a combination feeder-messenger wire saved the purchase and installation of a steel messenger, feeder insulated covering, cross-arms, brackets, tie wires and insulators. A private telephone line is carried on the trolley poles, and each car carries a portable Western Electric telephone set with jointed contact rod permitting the crew to communicate with headquarters at all times. The brackets are equipped at their outer ends with hooks to hold the messenger wire on the arms in case of a broken insulator. Six d.c. lightning arresters are installed per mile.

CARS AND EQUIPMENT

Eight passenger cars are at present owned by the company. These are of the double-truck, solid vestibule type; two were built by the Wason Manufacturing Company and six by the Laconia Car Company. The over-all length is 46 ft. and the width outside 8 ft. 8¾ in. The cars are of the semi-convertible type and are divided into two compartments in addition to the vestibules, one compartment being assigned to smokers and the other to passengers in general. The main compartment, 30 ft. long, contains twenty 19-in. x 31-in. green plush cross-seats and two 18-in. x 32-in. end seats of the longitudinal type. The smoking compartment, which is 6 ft. long, contains two longitudinal leather-covered seats 18 in. wide. The center aisle is 24 in. wide between cross-seats, while the aisle in the smoking compartment is 4 ft. 10 in. wide. Interlocking rubber tiling is used, and the cars are finished in mahogany, with leaded glass windows and monitor type roof.

The vestibules are each 4 ft. 6 in. long and 3 ft. 4 in. wide. Each is provided with two sets of Pullman type steps with trapdoors in the floor, three steps being provided in each case. The steps are each 10 in. wide. The bottom step is 22 in. above the rail, each of the risers being 10 in. high. The windows are designed to slide vertically into monitor pockets, no sill pockets being provided. Heywood reversible seats are used, and the cars are fitted with baggage racks. The smoking and main compartments are separated by a bulkhead having a central sliding door with ribbed glass panels. The end of each seat is provided with a leather ticket holder, eight holders also being attached to the inside sheathing, with four more in the smoking compartment above the seats.

The car lighting is accomplished by two 60-watt lamps in each vestibule hood above the steps, three lamps of this size in the smoking compartment and sixteen in the main compartment. The last-named are installed in three parallel rows.

Each car is equipped with four Westinghouse 304, 90-hp. motors, with type HL automatic air multiple-unit control, Westinghouse straight-air brakes and Baldwin and Brill trucks. The total weight of the car

PORTLAND & LEWISTON—END OF CAR SHOWING DOOR IN VESTIBULE

is 34 tons, and the motors are geared to a maximum car speed of 59 m.p.h. on the level. The wheels are of cold-rolled steel, 36 in. in diameter, with a standard M.C.B. flange and a $3\frac{1}{2}$ -in. tread. Each car is provided with two trolleys for double-end operation. Consolidated car heaters, Crouse-Hinds luminous arc headlights, and Westinghouse 15-B master controllers. In the front of each vestibule is a small door with a latch which can be opened from the outside only, to facilitate operating cars in trains.

Two brick carhouses, each 210 ft. x 75 ft., have been built at Portland and Lewiston for the use of the interurban. Each has four tracks with one inspection pit and concrete floors, and car-washing facilities.

There are no 5-cent fares on the interurban line and at present a two-hour schedule is being maintained. The schedule of fares is as follows from Lewiston: Littlefields, 10 cents; Danville Junction, 20 cents; Upper Gloucester, 25 cents; Lower Gloucester, 30 cents; North Gray, 40 cents; Gray, 45 cents; West Cumberland, 60 cents; West Falmouth, 65 cents; Deering Junction, 70 cents; Portland, 75 cents. In the month of July, 1914, the company carried 20,000 passengers. The population of the three terminal cities is 106,000.

The officers of the company are: President, William T. Cobb of Rockland; general manager, Fred D. Gordon of Lewiston.

Handling Traffic at Largest Baseball Park

Arrangements Made by the Boston Elevated Railway to Accommodate the Immense Crowds Which Will Visit This Stadium

What is said to be the largest baseball park in the world was opened for business on Aug. 18 at Boston, Mass. On this occasion there was an attendance of almost 50,000 fans. The park, which is locally known as "Braves' Field," has been provided with transportation facilities consisting of a loop surface track that extends into the property from the Commonwealth Avenue line of the Boston Elevated Railway, and that company has arranged for the rapid handling of short-headway service, as illustrated in the accompanying views. Just outside the ball park proper and parallel to ramps leading from the grandstand is an inclosed area about 600 ft. long and 50 ft. wide, bordered on one side by a wire

BOSTON BASEBALL TRAFFIC—CARS AT "BRAVES' FIELD" ON OPENING DAY

screen fence 10 ft. high and on the other by a concrete wall 12 ft. high and 6 in. thick. This area is utilized as a loading space and it contains two tracks capable of berthing about twenty cars of the semi-convertible, double-truck type.

Patrons of the game who desire to leave the park by trolley walk down one of the ramps to a prepayment station where change is made and then drop their fares directly into motor-driven International registering fare boxes which are located upon the platform, where cars are in waiting. Ten of these fare boxes are in service, and for the two prepayment stations there are six change windows, besides three more at other points along the platform. The leads for each fare box motor are run in conduit under the platform and are brought out at the box through a T-shaped fitting in one of the adjoining pipe standards. The prepayment stations are attractive semi-octagonal structures of concrete, 4 ft. 10 in. x 9 ft. 2 in. x 8 ft. in dimensions, with red tiled roofs. Incandescent lamps of 23 watt rating are installed in porcelain reflectors above the change windows for use in games that last until the late afternoon in the spring or fall.

International Engineering Congress at San Francisco

Traction in Its Broad Engineering Aspects Was Discussed at the Engineering Congress This Week by Sir Albert Stanley, E. H. McHenry, W. Barclay Parsons, Arnold Stucki, George H. Pegram, Prof. A. F. Ganz and Other Eminent Engineers

The International Engineering Congress of 1915 was held in San Francisco from Sept. 20 to Sept. 25. Partial summaries of the program were given in the issues of the *ELECTRIC RAILWAY JOURNAL* for Aug. 21, page 329, and Aug. 28, page 342. The congress was held under the joint auspices of the American Society of Civil Engineers, the American Society of Mechanical Engineers, the American Institute of Mining Engineers and the American Institute of Electrical Engineers. The proceedings of the congress will be issued in twelve volumes, to two of which each member is entitled, the index volume and any other one.

The following abstracts cover some of the papers on topics related most closely to the electric railway field.

LONDON TRAFFIC IN 1913

In this paper Sir Albert Stanley, London, England, gave a résumé of traffic conditions and traffic facilities in that city. He outlined first the geographical conditions existing in London, which is composed of a central core with a small permanent population but surrounded by the Administrative County of London with an area of 112 square miles and a population density of sixty persons per acre. Around the County of London lies a further ring known as Greater London with an area of 576 square miles and a density of population approximating seven and one-half persons per acre. Beyond this is a population clustering around the stations of the railways running out from London, yet looking toward London for its interests. This is known as the outer suburban ring. It has an area of 2115 square miles with a density of population of less than one person to the acre.

The author then discussed the traffic facilities, which include railroads, both underground and main-line, tramway or street car systems, and omnibus lines. The underground lines serve the central core of the city and London County, there being 180 stations in all with only thirty-three that lie outside the County. There are nine main-line or trunk railroads, which serve the whole city, including the outer suburban ring, with a total of 574 stations. The terminals of all of these railroads are detached and, with the exception of Charing Cross, are not located at a really immediate traffic center.

The tramways are practically excluded from the central area for reasons of convenience based on the unsuitability of the narrow thoroughfares, but in the County of London 145 miles of tramway are operated. Outside of London County there are 201 miles of tramway which have 2780 cars. None of these lines enter the City of London and the interurban railway is unknown. The motor-bus industry has spread a network of routes all over the area covered by Greater London and to parts beyond in the outer suburban districts. The number of buses owned approximates 3500.

With regard to the control and regulation of London traffic the author discussed at length the procedure involved in the construction of the railways and the tramways and in the licensing of motor buses. He outlined also the consequences of the unco-ordinated character

problems of the city's traffic as being the isolation and lack of correlation between the urban and trunk-line railway systems, the conflict between the tramways and the motor buses, and the exposed position of the motor buses together with the conditions that would be attached to a franchise if one was obtained for them. To solve these problems the Underground Electric Company of London has undertaken to bring a number of the different facilities under a single control, and to-day it is responsible for the operation of 61 route-miles of electric urban railway, 123 route-miles of tramway, and practically all the motor buses of London.

Data regarding the volume of London traffic in 1913 were cited both in relation to the traffic facilities and in relation to the population, the total being divided almost equally between the railways, tramways and the motor buses and the average number of journeys per head of the population working out at 271 per annum. Fluctuations in the volume of traffic were also discussed, seasonal variations being said to be not of major importance but the fluctuations in the course of the day being extreme. The latter are accentuated because of the workman's tickets at a reduced fare which is established by law on the railways and tramways, these giving a morning peak of extraordinary severity which is escaped altogether by the motor buses.

With regard to the improvements in railway capacity, the introduction of electric traction and automatic signaling was covered briefly, together with the results of an elimination of grade crossings at junctions which had been undertaken about the year 1910. The problem of the rush hours, however, was not acute owing to the numerous lines of approach, and the author saw no reason to anticipate that density of traffic would ever become a critical factor in London.

The fare problem in London was discussed at considerable length, the traffic being classified and distributed according to the rate of charge. This showed that there is no "fares system" in London at the present time. On the motor buses more than 99 per cent of the traffic is carried on a straight ordinary fare, the average receipt being 2.66 cents per passenger. On the tramways there are the workmen's reduced fares and the ordinary traffic corresponding to that of the motor buses, the former being almost 10 per cent of the whole. Variable fares are the rule, the average receipt approximating 2 cents per passenger. On the railways there are three distinct classes of passengers, namely, the statutory workman's traffic, a commuter traffic traveling on special tickets and the ordinary traffic, the latter covering 76 per cent of the whole. The average receipt of the whole traffic on the underground line of the London Electric Railway alone was 3.36 cents per passenger. The key to the fare situation of London is the rate of charge for ordinary passengers, as the fares charged to workmen and other classes are placed in relation to the fare of the ordinary passenger.

In the discussion of the subject the author took up the factors affecting the amount of the ordinary fare, the existing system of coinage in relation to fares, and the cost of operation per passenger. The existing scale

of fare was commented on at length. The author then took up the possibility of equalization of fares, speaking of the existing excessive differentiation between different rates of fare and upon the characteristics of a good fare system.

In conclusion, comment was made upon the heavy capitalization and low return from the traction enterprises in London, the only real remedy for this condition being expansion of traffic, and to this end the policy of advertising for traffic had been undertaken. This had been generally successful, but the solution of the London problem could never be conclusive unless to the detailed solution of the commercial and operating problems of the movement of traffic there could be brought a spirit of co-ordination and co-operation. Only in this way could the development of the traffic facilities be carried with economy, and the traffic conserved to afford opportunity for dividends on the money already sunk in their provision.

ELECTRIC MOTIVE POWER IN THE OPERATION OF RAILROADS

In this paper E. H. McHenry, McHenry & Murray, consulting engineers, traced the development and outlined the present status of heavy electric traction. He commented at length upon the advantages and limitations of electric motive power and discussed its adaptation to traffic requirements.

In connection with the future possibilities and tendencies of electric traction he spoke of the desirability of speed-torque control, believing that a better utilization of the possibilities of the electric locomotive is probable through this means. The radical difference in the speed-torque characteristics of steam and electric engines involves the necessity for closely designing electric locomotives for the service to which they will be assigned, as they cannot be operated above the critical speed corresponding to their horsepower rating without serious reduction of capacity. Nor can their effective adhesion be continuously utilized at lower speed without exceeding safe temperature limits.

However, a promising opportunity is presented for reducing and limiting the present rate of expenditures incurred for maintenance of equipment and for maintenance of way and structures by reducing axle loads of electric locomotives. The strength of rails and tracks on steam railways has not kept pace with increasing wheel loads, which, if not dangerous, certainly involve very costly construction standards and track maintenance. While the recent development of engines of the Mallet type permits lighter axle loads for equal tractive power it is not likely that such machines will long hold the field against their electric competitors in view of their disabilities of great weight, high machinery friction and costly repairs.

The author considered it probable that some form of multiple-unit control will be developed for the operation of freight trains. This would relieve and distribute the present excessive strains on draft rigging, tracks and bridges. The necessity for such equipment is close at hand in connection with similar requirements for electro-pneumatic brake control and the growing need for better means of communication throughout the length of great modern freight trains.

A set of specifications were submitted which were considered to provide ideal characteristics for an electric locomotive. While these were seemingly difficult of attainment there were no inherent difficulties in their way, and the author considered that such qualities would soon be forthcoming should the commercial demand for them become insistent. These ideal characteristics are shown in the accompanying table.

The author then took up the economic conditions suitable for the application of electric traction, covering such subjects as yield on investment, train frequency and speed, competitive conditions, multiple track levels, real estate and land values, track capacity, legislation,

Variable speed-torque control.	
Electric braking and power regeneration.	
No reciprocating parts.	
Rigid wheelbase not exceeding.....	8 ft.
Number of axles.....	Draft rigging limit
Weight on driving axle, per axle.....	40,000 lb.
Tractive power, 27 per cent adhesion per axle.....	10,800 lb.
Horsepower, continuous, per axle.....	720 hp.-864 hp.
Maximum speed, full traction rating.....	25-30 m.p.h.
Horsepower per ton weight on drivers.....	36 hp.-43 hp.
Horsepower per ton of total weight.....	30 hp.-36 hp.

economic comparisons of steam and electric conditions, train mileage, helper engine service, terminal, yards and tunnels, length of division, engine fuel and repairs. In connection with this he cited a rule-of-thumb method for quick approximation of conditions suitable to electrification, to the effect that the fixed charges of an electric installation should not exceed one-half of the cost of engine fuel and engine repairs under steam operation plus 10 per cent.

The ratio of coal consumption of steam and electric engines was stated to vary in different classes and conditions of service, but as ascertained by experience on the New Haven road the ratio in passenger service is approximately 1 : 2, in freight service 1 : 2½ and in switching 1 : 3. Under normal conditions the cost of repairs per engine-mile will vary between one-third and one-half of the cost in similar service.

In conclusion the author stated that there were many existing opportunities for capital investment in electrification upon a large scale which will earn from 20 per cent to 10 per cent with reasonable certainty. There is little reason to doubt a continued development and further expansion in the field as soon as the financial and legislative conditions permit. The paper concluded with an extended bibliography on the subject.

RAILWAYS

This subject was discussed by W. Barclay Parsons in most comprehensive detail, the author tracing the development of steam traction from the time of its inception up to the present. Statistics covering the railway track mileage in existence in the various countries of the world were submitted in tabular form by decades from 1830 to 1910, this being supplemented by data which included consideration of area and population with regard to railway mileage.

With regard to the details of operation tables were submitted showing the length of line, capitalization, equipment, revenues and expenses, number of passengers carried, number of tons of freight hauled, average number of employees, etc., for the important countries of the world, these figures also being summarized for each decade since the introduction of the railway. This data showed the great extent of railways in the United States with regard to total figures and indicating in a most striking manner the way in which the railways of the United States exceed those of other countries in the volume of their freight traffic. This superiority, however, does not extend to the volume of passenger traffic either in the total number of passengers carried or in the number of passengers carried per mile of line, but does exceed any of the other countries in regard to the total number of passenger-miles. Data regarding the receipts per passenger-mile and per ton-mile were also submitted in detail, these showing that the cheapest travel is found in India and the most expensive in the United States. When the receipts from freight per ton-mile are considered India, Canada, Japan and the

United States are close competitors for the lowest charge.

Statistical tables regarding the development of the steam locomotive and the freight car were also submitted, including a particularly interesting curve showing the number of cars of various capacities in service in the United States by years from 1902 to 1914. This showed a constant increase in the number of 100,000-lb. cars, an almost constant increase in the number of 80,000-lb. cars, and a decrease in the number of 60,000-lb. cars since the year 1908. The 50,000-lb. and 40,000-lb. cars have decreased steadily since 1902. The subject of gage for track rails both in the United States and abroad was also discussed in considerable detail.

Elaborate statistics for the last four decades regarding the number of passengers and employees killed and injured on railroads were also included, the figures for the United States standing out with totals that, without explanation, are appalling, the number of injured increasing in a much higher ratio than the increase in killed. However, this does not mean that there has been so great an increase in persons injured but rather an increase in the number of injuries reported.

In regard to the matter of ownership and regulation the author stated that, while there was a great diversity in practice throughout the world, undoubtedly there was a steady tendency toward government ownership, or at least more rigorous government control. When railways were first projected in England and in the United States they were regarded much as turnpike enterprises—purely private concerns with no thought of participation by national or local government, either as part owner contributors or controlling agents. This policy, except as to some form of government control, has been adhered to in the United Kingdom but in no other country. There followed a statement covering the titles and powers of the various commissions in existence in the different States of this country which have jurisdiction over railways. In a discussion on taxation it was pointed out that, notwithstanding their private ownership and public regulation, the railways contributed to the State treasuries more than 50 per cent as much as was paid out in dividends during the year 1914, a ratio that has steadily increased since the year 1904.

TRACK AND ROADBED

In this paper George H. Pegram, chief engineer Interborough Rapid Transit Company, presented in tabular form data regarding the track construction of a number of prominent steam and electric railways, accompanying this with cross-sectional elevations of track to show the various arrangements of ballast and drainage. After briefly discussing the different designs the author took up the subject of cross-ties and fastenings in considerable detail as they constitute the largest item of track expense and conditions affecting their use are rapidly changing. He stated that the hardwood untreated cross-tie probably makes the best track that can be devised owing to its elasticity, facility for making fastenings, resistance to displacement in the ballast, insulation of electric currents and, especially, its ability to resist destruction by derailed wheels. It is harder, stronger and tougher than a treated tie of equally good material. However, the use of sawed cross-ties treated with creosote or zinc chloride is desirable in most cases, as this leads to the greater conservation of the timber supply. Tie plates should be used on all treated ties, these preferably being designed with a flat bottom so as not to cut into the tie and allow the entrance of water. Screw spikes are necessary with ribbed tie plates but time and experience are still wanted to prove finally the merits of the screw spike as compared with the cut

spike. Cut spikes, when used with treated ties, should be driven in bored holes 7/16 in. x 4 in. but with hardwood untreated ties should be driven without previous boring. The present tendency is to use four-bolt joints, but six-bolt joints will ultimately prove better. In either case the bolts should be made of steel with a high tensile strength. Anti-creepers should be used on all tracks having one-way traffic, particularly on grades.

The author also advocated the use of rails of small section as these distribute the load over a poor roadbed with less proportionate stress because of greater flexibility and because the rail can be made of better quality, and submitted data to indicate that the performance of heavy sections from 85 lb. to 100 lb. is not as good as that of lighter sections ranging from 72 lb. to 80 lb. He considered that more attention should be given by the railroads to securing better wearing rails and that the carbon content of open-hearth rails can be increased to from 0.72 to 0.85 inasmuch as the phosphorous contents can be made considerably less than 0.04. He suggested also that it might be wise to lay rails normal to the coning of the wheel tread rather than normal to the axle, as at present, and thus getting more central pressure on the head.

In general the author considered that the mills were alive to the necessity for producing better rails and that it was in the mills that improvement must be made. The paper concluded with brief comments on alloy steel rails and on the composition of conductor or third-rails, a carbon content of 0.15 for the latter being possible without raising the conductivity ratio with copper above 7, thus giving a harder, more easily handled rail.

EFFECTS OF ELECTROLYSIS ON ENGINEERING STRUCTURES

This paper, which was presented by Albert F. Ganz, M.E., professor of electrical engineering, Stevens Institute of Technology, is an exceptionally complete treatise on the results of electrolytic action on various structures and the remedies that could be applied without making extensive changes in the near-by electric distribution systems. With regard to the effect of electrolysis on electric railway tracks and on iron or steel structures supporting them the author stated that, in future construction of elevated and tunnel structures, every precaution should be taken to maintain as high a resistance between the tracks and structure as possible. Where desirable, connections between structure and track may be made through suitable resistance at neutral points in order to avoid excessive potential differences between track and structure. These connections, however, should not under normal conditions carry substantial currents. Where the resistance between structure and track is low and cannot be adequately increased the most practical way to reduce the shunting of current through the earth is to reduce the track voltage drop.

With regard to the effect of electrolysis on underground lead-covered cable systems the author advocated the use of insulating joints installed in building laterals directly inside of the building wall. The cable ducts also should be constructed so as to be as nearly water-proof as possible and should drain to the manholes, the latter being drained to sewers wherever practicable. For main cable runs insulating joints may be installed in special cases to break up the electrical continuity of the lead sheath, but such joints must be installed only with great caution, and only where they do not cause the sheath on one side of the joint to become dangerously positive. Insulating joints cannot be generally applied to the sheaths of cable networks.

In discussing the effect of electrolysis on underground

systems for gas or water the author pointed out the limitations of the drainage system as compared with its efficacy for use with cable sheaths. He advocated the installation of insulating joints at the entrances of pipes to carhouses and, in some cases, the use of insulating coverings of adequate thickness, although he considered the latter to be actually dangerous unless they were perfect at all points. He opposed metallic contacts between pipes and railway tracks or other structures of metal, such as bridges.

With regard to steel foundations of buildings and reinforced-concrete structures insulating joints were recommended for all pipe and cable sheaths in connecting the structure to outside piping systems. Damage to reinforced-concrete structures requires special situations; for example, where stray current is brought in by way of a service pipe or where there is a direct contact between the reinforcing steel and one side of a grounded d.c. lighting system. While negative connections to the reinforcing steel will prevent corrosion by electrolysis it may result in destruction of the bonds between the reinforcing and the concrete, as this results when current flows from concrete to steel.

A brief outline of the status of electrolysis in Great Britain and Germany was included in the paper together with a discussion on the probable future tendency in electrolysis mitigation, support being given to the insulated return feeder system in the latter section. The paper closed with a bibliography covering the subject.

SIGNALS AND INTERLOCKING

The author of this paper, Charles Hansel, member American Society Civil Engineers, discussed the use of a.c. track circuits for signals, stating that the development of the a.c. signal marked an epoch in safe and economic railway operation. He spoke also of the importance of the development which came with the introduction of the upper quadrant semaphore signal and commented at length upon automatic train control.

He considered that the use of an automatic control system as an auxiliary would constitute a prominent forward step which would increase the unit of safety even though but one locomotive and but one block were equipped. It is unnecessary to have a definite percentage of all locomotives equipped before the benefit of the apparatus is secured as in the case of the air-brake system. The failure of the automatic control system is not by any means as serious as the failure of the visual system because it is only an auxiliary. The engineer has to depend upon the indication given him by the visual signal to advance or stop, but there is nothing in the automatic control which authorizes him to advance.

The perfecting of a system of cab signaling and automatic control of trains was stated to be a duty which should not be left to the unassisted effort of the individual. It seemed reasonable to expect that the governing powers should join the railroads and offer such incentives as would stimulate practical work, thus hastening the day when the traveling public would be more fully protected.

ROLLING STOCK OTHER THAN MOTIVE POWER

Under this title Arnold Stucki pointed out the improvements made in car equipment during the past decade in the United States and Canada, calling attention to the modern provisions for the safety and comfort of passengers, for efficiency in handling freight and moving trains and for the protection of freight in transit. Credit, he said, was due to the Master Car Builders' Association for most of the progress that had been made

along these lines, and the standards and recommended practices of that association were listed to show the scope of its activities. In connection with the development of special parts, attention was called to the modern brakes which will stop a train in 1000 ft. from a speed of 60 m.p.h.; to couplers which operate successfully under the most unfavorable conditions without the necessity for operators going between the cars; to the rapid introduction of electricity for train lighting; to the use of cast steel for bolsters and truck parts; to the friction draft gear which frequently provides capacity of 200,000 lb., and to frictionless side bearings and similar specialties.

Beginning with the all-steel cars built for the Erie Railroad in 1904 a history of steel passenger-car construction was outlined. Various types of freight cars were also described, special attention being given to the all-steel box cars which are rapidly coming into use. Various types of trucks for cars were also discussed, including the six-wheel freight-car truck used by the Norfolk & Western Railroad for its 90-ton coal cars. The paper was profusely illustrated with photographs of complete cars and trucks as well as drawings of details and it ended with a bibliography treating with modern railroad car design.

PRESERVATIVE TREATMENT OF TIMBER

The authors of this paper, Howard F. Weiss and Clyde H. Teesdale, presented a general review of the results of wood preservation obtained in the United States by showing the quantity of wood preservative used and the amount of timber treated annually, as well as the extent to which the various treatments have prolonged the natural life of wood. In addition a partial bibliography was appended covering American practice.

The authors' conclusions were that the wood preserving industry has become firmly established. This is shown by the fact that more than 150,000,000 cu. ft. of timber is being treated annually, the increase in the amount of wood treated between the years 1908 and 1913 being 230 per cent. The industry has made possible the use of quantities of non-durable timber which, without treatment, would be but little used, and it has relieved the heavy demand from a naturally durable woods which were rapidly becoming exhausted. Even when the more durable species are treated their length of service is increased.

The industry has materially lessened the drain upon the forests, especially in the case of the more valuable woods, because of the greater life given to timber that is subject to decay. The extensive practice of preservative treatment has been too recent to make its influence on forest demands apparent. It seems likely, however, that unless new systems are developed the demand for treated timber will ultimately decrease because replacements will be made less frequently.

Six impregnation practices are now in general use in this country. These are the Bethell (full-cell creosote), boiling, Burnett (zinc chloride), Card, Lowry and Rueping. Considerable quantities of telephone poles and construction timbers are also treated by the open-tank, kyanizing, dipping and brush methods.

The oldest records reported to the authors on the efficiency of treatment are on the full-cell creosote, Burnett and Wellhouse processes. It is reported that 150,000 pine ties treated with 10 lb. of creosote per cubic foot gave nineteen years of life on the H. & T. C. Railway; 12,000,000 Douglas fir ties treated with 0.27 lb. of zinc chloride per cubic foot gave from ten years to twelve years average life on the Southern Pacific Railway; 4,800,000 Douglas fir ties treated with 0.35 lb. to 0.50 lb. of zinc chloride gave from ten years to twelve years of

life on the C., B. & Q. Railway; 5,600,000 hemlock ties treated with 0.50 lb. of zinc chloride by the Wellhouse process gave eleven years average life on the C., R. I. & P. Railway. Relatively little data are as yet available on the complete durability of timber treated by the Card, Lowry and Rueping processes as applied in the United States.

Experience has shown that timber improperly prepared for treatment is very liable to give unsatisfactory service. It is of prime importance to have timber properly peeled and seasoned before treatment, and also to be sure that it contains no advanced decay. In general the most approved method of treatment is in the open air. Conditions sometimes demand artificial seasoning, which is satisfactorily accomplished either by steaming or boiling in oil. High temperatures during artificial seasoning have been shown to injure the timber, and the best practice is not to exceed 260 deg. Fahr.

The following table was also included in the paper to show the status of the principal wood preserving processes now in use in the United States:

TABLE SHOWING THE PRINCIPAL WOOD-PRESERVING PROCESSES IN USE IN THE UNITED STATES

Name of Process	Preservative Used	Patent Number	Date Patent Was Issued	Company or Individual Controlling Patent
Bethell or full-cell	Creosote	Expired		Open to all
Boiling	Creosote	Expired	Aug. 27, 1895	Open to all
Burnett	Zinc chloride	Expired		Open to all
Card	Creosote and zinc chloride	815,404	March 20, 1906	J. B. Card
Kyanizing	Mercuric "	Expired		Open to all
Lowry	Creosote	831,450	Sept. 18, 1906	American Creosote Co.
Open Tank	Creosote	Expired		Open to all
Rueping	Creosote	709,799	Sept. 23, 1902	Lembcke von Bernuth Co.
Wellhouse	Zinc chloride, glue and tannin	Expired		Open to all

THE MECHANICAL PROBLEM OF THE ELECTRIC LOCOMOTIVE

The author of this paper, G. M. Eaton, engineer railway division, Westinghouse Electric & Manufacturing Company, confined his discussion closely to the side-rod type of locomotive in which the motor is connected to a jackshaft by rods and the jackshaft in turn is connected to the drivers by rods. The only type of locomotive of this design used in this country is that now being operated on the New York electrified zone of the Pennsylvania Railroad.

In the analysis of the stresses and strains upon the rods and bearings it was stated that the maximum stress would vary as an inverse function of flexibility, this constituting an argument in favor of the heat-treated and alloy steels since high-unit stresses and greater deflections were permissible. The maximum stress varies as an inverse function of the load, as a direct function of the speed (with motors of series characteristics) and as a direct function of pin and journal clearances.

A series of elaborate polar diagrams were included to indicate the force distribution on the crank pins and jackshafts and their bearings, these showing that the movements of the contact points in the bearings were extraordinarily irregular. The contact point at the jackshaft bearing moves in a direction in general opposite the direction of the shaft rotation, traveling around the shaft twice for every shaft revolution. It was shown that there was a tendency for the wear of the bearing brasses to be downward. During a hard start, however, the wearing tendency is practically the same in the upper and lower half of the bearing brass so that the nature of the actual wear becomes a function of the service. If the service is starting a train on a level and running at high speed for long distances the jackshaft bearing brass may be expected to wear downward. There is

also a tendency for the shaft to pound in the bearing on one side. With the materials, proportions and clearances customary in electric locomotive practice in the United States and at 40 per cent rail adhesion, the maximum stress on either rod is about 115 per cent of that imposed with the cranks at the 90 deg. position. At maximum speed this maximum stress rises to 135 per cent.

MACHINE SHOP EQUIPMENT, METHODS AND PROCESS

In this paper E. R. Norris, director of manufacturing operations, Westinghouse Electric & Manufacturing Company, took up a number of the important recent developments in machine shop equipment and practice, discussing first the origin and present status of the high-speed-steel tool and outlining tests that could be made to determine the best steel for each purpose from among the many different makes of steel that were offered to the manufacturer. He stated that tests have been made on butt-welded tools formed by welding tips of high-speed steel to low-grade carbon-steel shanks, the process being quite successful, but though the initial outlay for the solid tool is considerably greater than that for the welded tip tool, the cost of upkeep increases the cost of the latter so much that in the end it does not constitute a real economy. In connection with the use of high-speed steel for dies it has been found that the costs of carbon-steel dies and high-speed steel dies for a given production are approximately as two is to one, the loss due to hardening being very small, or less than 1 per cent. The heat-treatment of tools was also discussed briefly.

The author commented upon a new substance that has been placed upon the market under the name of Stellite, which is not the steel but is a composition of cobalt, chromium, tungsten and iron with small amounts of nickel, manganese, silicon and molybdenum. This material cannot be forged, rolled or machined and must have the cutting edge well supported close to the work. Stellite tips may be brazed or electrically welded to shanks of carbon steel and may be reused until repeated grinding renders the cutting material very thin. Cutting speeds on machinery steel have been quadrupled over those of high-speed steel, thin cast-iron frames which were very hard because of a slight chill having been successfully planed at a cutting speed of 300 ft. per minute, whereas high-speed steel gave but 45 ft. per minute. In this case also the Stellite tool finished nine pieces for each grinding as against one piece finished for each grinding of the high-speed steel. On sandy brass castings the cutting speeds with Stellite have been doubled.

With regard to the selection of machinery for various machine shop purposes the process for manufacture of accurately finished steel shafts of medium size were outlined in detail and the advantages of milling under stream lubrication were discussed. There was mentioned also the continuous method of milling in which the work is mounted upon a circular table which has several independent chucks for holding different pieces of work, these being set under the tool in rotation, the operator having time to take out the finished casting and put in new castings while the cut proceeds. Comment on modern drills and drilling machinery was included, reference being made to the use of attachable multiple drill heads for machines which may even be arranged for drilling in five or more directions at one time.

In connection with grinding and grinding machines the author said that considerable saving is being effected by the use of disk grinders on many flat surfaces

that were formerly milled, this being more noticeable in dealing with castings that are liable to be chilled and brittle. Grinding also possesses decided advantages where the shape of the casting is such that, in order to prevent springing, great care is necessary in chucking the work in the milling machines.

Among the grinding machines described was one where two cupped grinding wheels with parallel faces are used, the work being fed between them and thus being ground with parallel surfaces. This machine is used in advantage in finishing bosses on resistance grids, completing them at the rate of forty-five grids per hour. Ring wheels may be used to advantage for removing scale and for stock which is rough. They have the advantage of a much longer life than the steel wheels with abrasive circles of cloth glued to them. In the case of the resistance-grid grinder above mentioned, ring wheels 3 in. thick were ground down 1/16 in. on the face after one month's work, whereas two abrasive circles would usually be worn out by four days' work. Another form of dry disk grinder was described in which the wheel is horizontal and the work bears directly upon the abrasives, being ground by the pressure exerted by its own weight. This is especially suitable to frail castings which might spring while being clamped. For the production of true flat surfaces on hardened steel dies the vertical surface grinder was highly efficient, the work being held by means of a strong magnetic chuck. The vertical grinder has displaced the horizontal grinder in most cases, producing from 50 per cent to 75 per cent more work although the vertical grinder costs five times more than the horizontal machine in the upkeep of wheels. In connection with cylindrical grinding the advantages of the wide grinding wheel were outlined, as this eliminated lost time at the end of each pass of the wheel along the work.

Successful results in sharpening files by the use of the sand blast were also cited, the files being sharpened by being held in such a manner as to expose the backs of the file teeth to the cutting action of the sand. In conclusion the author commented upon electric drives for machine tools, and also upon the advantages of actual demonstration as a basis for selecting new machines.

NOTES ON THE PROCEEDINGS OF THE CONGRESS

Interest in the administration and technical features of the Panama Canal and in the development of the Diesel engine were the chief features of the sessions held prior to the recess on Wednesday afternoon. The session devoted to these subjects drew the largest attendance. Discussion, however, in all of the sessions was disappointing due to the limited advance distribution of papers. Furthermore, the authors in most cases were absent, a fact tending to suppress the questions which might ordinarily be put. The papers, however, a number of which are abstracted above, possessed unusual value. The first session, on Monday morning, was an impressive gathering fully befitting the magnitude of the work which occasioned the congress. On the platform with the honorary president of the congress, Major-General George W. Goethals, were the vice-presidents, the foreign delegates and the presidents and secretaries of the national engineering societies.

The real business of the convention began on Monday afternoon with a well-attended session on the Panama Canal. The papers were of a general rather than an engineering character. Technical details regarding the canal were treated in ten papers presented in two succeeding well-attended sessions. On Tuesday morning the congress split into sections with six to eight sessions in progress simultaneously. The second session on rail-

ways following the presentation of the paper by William Hood, chief engineer Southern Pacific Railroad, brought out a discussion on the extent to which practice for locating steam lines should be modified for a line to be operated electrically. It was advanced that the shorter wheelbase of the electric locomotive allowed the use of sharper curves, while its great overload capacity for shorter periods permitted steeper short grades than does the steam locomotive. Mr. Hood, however, was of the opinion that it is not advisable to locate a line on the theory that steam equipment will never be used on it as such an assumption is not likely to be borne out.

Discussion on transit problems at the first municipal session developed comment from M. M. O'Shaughnessy, city engineer of San Francisco, that in a very short time a system of elevated tracks would be necessary in that city. Preliminary studies that have already been made show that the double-track elevated line may be expected to cost \$800,000 per mile, as against \$3,500,000 per mile for a subway system. He estimated the construction of surface lines to cost about \$215,000 per double-track mile. He pointed out that under present traffic conditions a trip to the western residence district during rush hours requires twenty minutes longer than would be required with an effective rapid-transit system, and that this time saving multiplied by the total number of passengers carried represented an annual saving warranting a considerable investment in a rapid-transit system.

Steam Railroad Earnings for 1915

According to the returns of the Bureau of Railway Economics for steam railroads operating an average mileage of 228,554 during the fiscal year ended June 30, 1915, the total operating revenues during the year amounted to \$2,889,029,457, or an average of \$12,641 per mile of line. Operating expenses amounted to \$2,032,689,894, an average of \$8,894 per mile, and net operating revenue amounted to \$856,339,581, an average of \$3,747 per mile. Compared with the fiscal year 1914, the current year shows a decrease in aggregate operating revenues of \$163,404,055, or 6.3 per cent per mile; a decrease in aggregate operating expenses of \$186,244,099, or 9.3 per cent per mile; a resultant increase in net operating revenue of \$22,840,044, or 1.8 per cent per mile. Taxes decreased \$2,765,192, or 3 per cent per mile, while operating income increased \$24,991,787, or 2.6 per cent per mile. It should be noted that nearly half the decrease in expenses represents decreased maintenance expenditures, which in all probability are merely deferred.

Reduced to a per-mile basis, the operating revenues of the Eastern group of railways decreased 4.9 per cent; operating expenses decreased 10 per cent; net operating revenue increased 11.5 per cent; taxes decreased 1.9 per cent, and operating income increased 14.4 per cent. On a similar per-mile basis, the operating revenues of the Southern railways decreased 10.4 per cent; operating expenses decreased 10 per cent; net operating revenue decreased 11.3 per cent; taxes decreased 3.6 per cent, and operating income decreased 12.9 per cent. Again, on a per-mile basis, the Western railways show a decrease in operating revenues of 5.6 per cent; a decrease in operating expenses of 7.5 per cent; a decrease in net operating revenue of 1.6 per cent; a decrease in taxes of 3.7 per cent, and in operating income of 1.3 per cent.

The above figures are based upon monthly returns to the Interstate Commerce Commission of all steam railroad companies, including switching and terminal companies, having annual operating revenues above \$1,000,000. The compilation covers about 90 per cent of the total mileage of the steam lines in the United States.

Another Six-Cent Fare Granted

Petition of the New Bedford & Onset Street Railway for Authority to Increase Fares is Granted in Its Entirety by the Massachusetts Public Service Commission—the Main Features of the Commission's Decision Are Abstracted in This Article

The Massachusetts Public Service Commission on Sept. 8 unanimously authorized the New Bedford & Onset Street Railway, New Bedford, Mass., to revise its fares according to its petition of April 14. In this petition, which is to go into effect on Oct. 8, the company proposed: (1) To make the cash fare 6 cents for every ride within the limits of any fare zone, the previous cash fare being 5 cents. (2) To sell tickets at the rate of twenty rides for \$1, the previous rate being twenty-four tickets for \$1. (3) To sell special school tickets at the rate of ten for 30 cents to pupils entitled by law to half-fare transportation. The previous rate was ten tickets for 25 cents. A résumé of the decision now rendered is published below.

HISTORY OF COMPANY

The company was organized in 1900. The main line, about 22 miles long, runs from a connection with the tracks of the Union Street Railway of New Bedford at the Fairhaven-Mattapoisett boundary line through Mattapoisett, Marion and Wareham to Monument Beach in the town of Bourne, as shown in the accompanying map. The Union Street Railway and the New Bedford & Onset line are virtually under one management, and traffic in and out of New Bedford is handled by agreement. A branch of the New Bedford & Onset line, about 15 miles long, extends from Wareham through a corner of Rochester to Middleborough, where there is a connection with the Bay State Street Railway. The total single track mileage is 44.01 miles, of which 9.27 miles is on private right-of-way and the balance on the public streets. The population of the six principal towns served is now 20,366, an increase of

36.5 per cent over 1900. Comparatively little manufacturing is done, for the towns are mainly rural communities popular as summer resorts.

FARE ZONES

The road is divided into a system of overlapping fare zones, those on the branch line being somewhat longer. The fare from Fairhaven to Monument Beach is 40 cents. From Middleborough to Wareham it is 20 cents for 15.2 miles, while owing to the shorter zones on the main line the fare from Fairhaven to the same point, a distance of 12.4 miles, is 25 cents. On the original line the charge from Fairhaven to Onset Beach was at first 20 cents, but in 1904 the number of zones was increased, making the through fare 30 cents. The through fare from Middleborough to Monument Beach over the line originally operated by the Middleborough, Wareham & Buzzards Bay Street Railway (which went into a receivership in 1904 and subsequently became a part of the New Bedford & Onset system) was at first 25 cents. During the receivership it was increased to 40 cents, but after reorganization it was fixed at 35 cents, where it has remained. Since 1905 there have been no changes in regular rates of fare or in zones upon any parts of the system, except that the reduced rate tickets (sold at twenty-four for \$1) have been introduced. In summer the company sells, in conjunction with the Bay State Street Railway, special excursion tickets good from Brockton to Onset Beach via Middleborough, at the rate of 40 cents, equally divided. The regular fare for that portion of the journey on the New Bedford & Onset system is 25 cents.

INVESTMENT RECORD

The assets of the company on June 30, 1915, totaled \$993,921, the larger items being cost of railway, \$598,614; cost of equipment, \$117,299, and land and buildings, \$215,948. The capital stock was \$550,000 and the funded debt \$280,000, current liabilities were \$28,987, and accrued liabilities \$7,257; sinking and other special funds amounted to \$77,703 and the surplus was \$32,299. The company asserts that it did not take over the mortgage debts of the Middleborough, Wareham & Buzzards Bay Street Railway, that it is the owner only of the equity of redemption in that property and that it pays interest merely to protect that ownership. The commission holds that for purposes of comparison these bonds should be included with the liabilities, and that the full book value of the Taunton & Buzzards Bay company (successor of the M., W. & B. B. line) should be included with the assets. The board finds the total capital investment to be \$997,675. The company also has outstanding short-time notes to the amount of \$19,500, which may represent in whole or in part additional capital investment.

By the accumulation of reserve funds since 1906 the company has been able to provide for all additions and improvements out of income, and at the same time to effect a considerable reduction in its floating debt. The table included in the report of the commission in the Blue Hill case, decided on July 31, 1915, shows that the \$21,666 per mile book value of the company's permanent property is low in comparison with others in the State.

MAP OF NEW BEDFORD & ONSET STREET RAILWAY LINES

With allowance made for the fact that the returns do not include with the assets the real cost of the Taunton & Buzzards Bay property, the book value becomes \$25,075 per mile, still a comparatively low figure. The cost of the original New Bedford & Onset line was about \$40,000 per mile, owing to a high standard of construction and to the company's share in highway construction involved in its location grants.

REPRODUCTION COST

The company recently made an inventory of all its property, together with an estimate of the cost of reproduction new as of Dec. 31, 1914, and the accrued depreciation. The engineers of the commission carefully checked this inventory and also made an estimate of the reasonable original cost of the property as it existed on July 1, 1915, separating what was formerly the property of the Taunton & Buzzards Bay line from that directly constructed or acquired by the New Bedford & Onset company. The report of the engineers has been made a part of the record. The following table shows the various values:

	Reproduction Cost, New	Original Cost Estimate	Book Cost
New Bedford & Onset Line.....	\$895,562	\$795,711	\$933,824
Taunton & Buzzards Bay Line.	421,023	354,045	190,902
Total	\$1,316,585	\$1,149,756	\$1,124,726

In the case of the Taunton & Buzzards Bay line the engineers estimated, not its reasonable cost to the New Bedford & Onset company but the reasonable cost of construction. This portion of the road was acquired at a reduced price some years subsequent to construction after depreciation had set in. The total reasonable cost of all the property is estimated at \$986,613, obtained by adding the estimated reasonable cost of the New Bedford & Onset road (\$795,711) and the actual cost of the Buzzards Bay property (\$190,901). This compares with a total capital investment of \$997,675, exclusive of short-time notes, and the difference is nearly offset by the cash assets.

In their estimates the engineers included substantially the same overhead charges as appear on the company's books, and also allowed about \$37,000 more than ordinarily would be reasonable for grading item, owing to the contention that the work was done largely in winter. An estimate of reasonable cost made some years after the construction period cannot be considered a wholly reliable guide, for legitimate items of cost entering into the construction of most railways are not apparent upon subsequent inspection of the property. The discrepancy between the estimate and the book figures, however, seems too great to be entirely accounted for in this way. The company's own estimate of replacement cost is about \$40,000 less than the book figures. The evidence indicates that the reasonable cost of the property is at least equal to the proceeds of the bond and stock issues, and the amount upon which a fair return should be reckoned is not less than \$997,675 (which does not include the short-time notes) unless deduction should be made for accrued depreciation.

DEPRECIATION

From 1902 to 1915 the yearly expenditures for maintenance and depreciation averaged \$25,576, or 22.42 per cent of operating revenue. The greater part of these outlays were for maintenance, but the company has from time to time written off, through the profit and loss account, the value of items of property abandoned or destroyed. Moreover, in a sense, it made a partial provision against depreciation in the low cost at which it acquired the Taunton & Buzzards Bay property. While a company, if it purchases property at less than

its original cost, is entitled to a return only upon the actual amount of its investment, it is fair that depreciation should be estimated on the basis of the original cost and that the low purchase price should be an offset to depreciation.

In its appraisal the company estimated the total depreciation at \$421,109, making the present value \$895,476. The commission's engineers placed the depreciation at \$408,702, making the present value \$741,053. Since the depreciation reserves and a portion of the unappropriated surplus have gone into the property, the latter present value shows a loss of about \$256,000 from the investment of \$997,675, represented by the stock, bonds and premiums on bonds. It seems clear that the company has not made sufficient provision for depreciation. Yet in view of the meager dividends paid, the efforts to increase revenues, and the low price at which the Taunton & Buzzards Bay property was acquired, it does not appear that this failure can justly be attributed to mismanagement. The return, therefore, should be figured upon the capital investment of \$997,675, without deduction for accrued depreciation. As stated in the Blue Hill case, however, this must not be understood as a ruling that the company, if it earns the amount to which it is entitled, can properly pay dividends before past depreciation has been provided for.

RESULTS OF OPERATION

The company's operating records from 1902 to 1915 inclusive show operating revenues, \$1,596,837; operating expenses, \$1,070,514; net operating revenues, \$526,323; no miscellaneous income; deductions from income, \$356,997; net divisible income, \$169,326; dividends, \$66,000; surplus, \$103,326; profit and loss adjustment (debit), \$72,413. Dividends were paid only in four years, and then only to the extent of 3 per cent. Last year no dividends were paid. In the last ten years the net divisible income, without allowing for depreciation allowances or other necessary charges to profit and loss, has ranged from 0.63 to 3.72 per cent on the outstanding capital stock. Interest upon unfunded debt has been insignificant. It is clear that additional net earnings, either through a decrease in operating expenses or an increase in gross revenue, are necessary in order to yield an adequate return upon the stockholders' investment.

OPERATING EXPENSES

The commission finds no apparent indication of extravagance or unnecessary expenditures. The company may be criticised for its failure to secure any interest upon its bank deposits, though these returns would be small. Management expenses have been low, the salaries of the four principal officers in 1915 aggregating only \$3,150. Wages of motormen and conductors increased from 2.71 cents per car-mile in 1905 to 4.24 cents in 1914, but no blame attaches to the company for this.

RELATIONS WITH THE UNION STREET RAILWAY

The New Bedford & Onset cars are taken at the Fairhaven line by the Union Street Railway and are carried into New Bedford over its own tracks, under its own power and with its own crews, or with New Bedford & Onset crews, which it pays while they are in its territory. The Union Street Railway keeps all the fares collected during this journey and grants the usual transfer privileges to all parts of its system. It pays the New Bedford & Onset company 3 cents a car-mile for the use of its cars and also 2 cents for every adult passenger delivered at the Fairhaven line and also 1 cent for every pupil riding on a school ticket. In 1915 the New Bedford & Onset company received \$2,090 for the use of its

cars and \$3,557 for the passengers delivered. The car rental is a usual charge, but the payment for passengers delivered is unusual if not unique in the State. It is in the nature of a commission paid for new business furnished and is analogous to the division of joint freight rates in certain cases, where the company on whose lines the traffic originates receives the larger proportional share. The arrangement is distinctly favorable to the Onset company.

POWER REQUIREMENTS

The Union Street Railway also sells the New Bedford & Onset company power for use between the Fairhaven line and a point about 1.5 miles distant from Mattapoisett at the rate of 3 cents per car-mile with 1 cent additional when the cars are heated. For the small amount used this rate is not excessive. Until recently the New Bedford & Onset company generated its own power, with the exception of small amounts purchased, and sold its surplus to the Marion Gas Company. The station equipment was antiquated and inefficient, and the cost comparatively high. To remedy this situation the company contracted on May 1, 1915, for more than nine years with the New Bedford Gas & Edison Light Company for the supply of power. Under this contract the railway company has shut down its generating plant and has installed suitable converting apparatus. Power from the Edison company costs from 0.95 to 1.1 cents per kilowatt-hour, according to the amount supplied. The railway company sells energy to the Marion Gas Company at from 1.1 to 1 cents per kilowatt-hour. Under certain conditions the railway company makes a slight profit upon the power thus sold and under others none, but in no case does it lose. The arrangement, by increasing the quantity purchased from the Edison company, makes a lower cost possible to the railway. Under these contracts no transmission losses are assumed by the railway company except between its own substation and its cars. The contracts have been carefully examined by the commission's engineering staff and appear economical, but the board holds that the idle and antiquated equipment should be written off the books in a reasonable time.

EQUIPMENT MAINTENANCE

The New Bedford & Onset cars are painted at the Union Street Railway's shops, and the former road buys from the latter certain materials and supplies which it cannot buy to advantage direct from the dealers. For all labor furnished in such cases the Union Street Railway charges cost plus 20 per cent. Materials and supplies are sold at cost plus 10 per cent. The percentages cover use of tools and shops, storage, purchasing department expense, etc., and the terms seem in line with the practice of other companies. The Boston Elevated Railway, for example, on such outside work charges cost plus 25 per cent for labor and cost plus 10 per cent for materials.

MAINTENANCE EXPENSES

During the last few years maintenance expenses have increased rapidly, and in 1915 were higher than ever before. The inspection department of the commission reports that the track is in fair condition generally, about two-thirds of the original ties being in the ground. These should all be renewed within the next five years. Many of the original chestnut poles are still in use and should all be renewed within the next six or eight years. The company replaces the old 30-ft. poles with old 35-ft. poles. The department estimates that the average annual expenditure which should be made for the next few years to maintain the track and overhead structures is about \$27,800. The average annual

expenditure for the last five years has been \$20,539, and expenses for maintenance of equipment in this period have averaged \$14,729.

PROPOSED CHANGE IN FARES

There seems to be no reasonable prospect of an increase in net earnings through a reduction in operating expenses, except so far as the new contract results in saving in the cost of power. This will be relatively small, for the total net cost of power in 1915 was only \$21,114. The company proposes, in brief, to increase the cash fare from 5 to 6 cents, to increase the ticket fare from 4.17 cents to a flat 5 cents, and to raise the rate for school children from 2.5 to 3 cents. In each case the increase would amount to 20 per cent. Under this arrangement the cash fare from the Fairhaven line to Monument Beach would be 48 cents, or about 2.18 cents per mile, while the ticket fare would be 40 cents, or about 1.82 cents per mile. From Middleborough to Monument Beach the cash fare would be 42 cents, or about 1.69 cents per mile, and the ticket fare 35 cents, or about 1.41 cents per mile. Undoubtedly the through cash fare on the main line would be high, as street railway fares go in the State. Under the new schedule recently allowed in the Blue Hill case the through cash fare on the main line is at the rate of about 1.67 cents per mile. The similar cash rate on the Norfolk & Bristol line is about 1.75 cents per mile.

What additional revenue the increase will produce is problematical. Last year the revenue passengers were divided into the following classes, according to the character of the fare paid:

Class	Number	Per Cent of Total
Cash fares	1,890,022	69.44
Ordinary tickets	678,811	24.94
School tickets	128,610	4.72
Excursion tickets	24,433	0.90
Total	2,721,876	100.00

With no decrease in traffic and the same relation between the classes of traffic, the increased fares would produce about \$25,000 additional revenue. There is a decided possibility, however, that a decrease in traffic may result, and it seems probable that a larger percentage of passengers will use the reduced rate tickets. In the board's opinion the revenue realized from the increase will not exceed \$20,000, and if jitney competition should be stimulated the results might be unfavorable.

DISPOSITION OF POSSIBLE INCREASE

The net divisible income for 1915 was \$7,385, while the average net divisible income for the last five years was \$15,111. If the company should secure \$20,000 additional revenue from a fare increase, and should be able to save \$5,000 on the cost of power (assumptions of doubtful certainty), its net divisible income would be \$32,285 on the basis of last year's figures, or about 5.8 per cent on the capital stock without allowing for any depreciation or other necessary charges to the profit and loss account. Upon the basis of the average figures for the last five years, the net divisible income would be \$40,111, or about 7.3 per cent on the capital stock, without depreciation and other allowances. Upon neither basis, the board is satisfied, would the company actually earn 6 per cent upon its capital stock if it made proper provision for the upkeep of its property.

CONCLUSION

In a proceeding like this the commission has no arbitrary power and it can refuse to allow a company to increase its rates only where the weight of evidence clearly indicates that the increase is likely to prove

unjust and unreasonable. If results prove more favorable than anticipated and earnings become excessive, the opportunity to secure a reduction in rates under the statutes is always open. In view of the high mileage rate represented by the 6-cent cash fare, the board is of the opinion that every effort should be made to make the reduced rate tickets available to the regular patrons of the road and to facilitate their use. The tickets should be sold by conductors on the cars or at convenient points in each of the towns, and the fact that they are thus sold should be advertised in a conspicuous place in each car. It is also recommended that the company consider carefully the advisability of installing a system of collecting and registering fares whereby it will be possible to collect in one operation the fares of through passengers in two or more zones, so that the annoyance of paying additional fares at frequent intervals may be avoided.

Dynamite Explosion Causes New Subway Cave-In in New York

Subway Structure in the New Seventh Avenue Tube Is Weakened by Heavy Blast—Surface Car Filled with Passengers Drops into 30-Ft. Trench

Seven persons were killed at 8 a. m. on Sept. 22 in an extensive cave-in of the new Seventh Avenue subway in New York, between Twenty-fourth and Twenty-fifth Streets, when a dynamite blast weakened the temporary wooden roadway over the subway excavation, and precipitated the whole structure into a 30-ft. deep cut. More than twenty people were seriously injured, and about 100 were hurt in various ways.

As the roadway timbers for a distance of about 400 ft. collapsed a closed street car of the New York Railways, which was loaded with passengers, a large brewery wagon, and a few other small wagons and push carts were carried with it. A large number of employees who were on their way to work in the National Cloak & Suit Company, the building of which was located adjacent to the disaster, were also carried down. Beneath were about fifty workmen, some of whom were caught and killed by the débris.

For almost two blocks the excavation was a mass of splintered timbers, twisted water pipes, gas mains and trackage. The extent of the cave-in was remarkably well defined. The entire street section for a block and a half had fallen into the deep 30-ft. trench below, yet not any portion of the sidewalk pavement or of any buildings had collapsed owing to their solid rock foundations. Moreover, the caved-in section of the subway,

which was composed of only the temporary wooden beam framing, was bounded at each end by sections which already had steel framing installed.

The ill-fated street car, the remains of which are shown in an accompanying photograph taken especially for the *ELECTRIC RAILWAY JOURNAL*, contained at the time of the accident about fifty passengers. When the street buckled under, the surface car tracks together with the intervening asphalt pavement and conduit contact rails and framing sagged down to the bottom of the great pit, but even then remained mostly intact. Notwithstanding this fallen position, the maximum-traction trucks of the fallen car continued to remain on the tracks, but the wooden body was ripped off in a distinct line just above its underframe, and bent over sideways. Its roof was flattened out. The wreckage of the street car was full of injured persons and two dead.

John Mayne, motorman of the car, who was taken to a hospital with a leg crushed, stated that the car sank just where he stopped it, when warned by a flagman. In substantiation of Mayne's story, an investigation showed that the brakes of the wrecked car were set and that the controller was off.

Immediately after the accident, all available ambulances, police reserves and fire apparatus were summoned. A smoldering fire which had started in the wreckage was quickly extinguished. Steps were taken to shut off all electric wire circuits and all leaking gas and water mains. The fire apparatus was put to work pumping out water from the excavation. As fast as bodies were released from the mass of wreckage they were carried up ladders to the street. Wrecking companies were soon on the spot with derricks, which were employed in lifting the masses of débris.

Shortly after the accident seven independent investigations to place the blame were under way. These inquiries were started by District Attorney Perkins, the Fire Department, the Public Service Commission, Coroner Feinberg, the contracting company, the State industrial commission, and the street railway company.

The following description of what took place immediately before the street deck dropped into the subway ditch was given by Augusto Mezzanotte, or August Midnight as he is known, the boss blaster who placed the fatal charge and ran away temporarily in a panic of fright after the accident.

NEW YORK SUBWAY CAVE-IN—VIEW OF TRENCH CAUSED BY EXPLOSION

NEW YORK SUBWAY CAVE-IN—VIEW SHOWING STREET CAR WHICH FELL 30 FT. INTO TRENCH

"I went to work at 7 o'clock in the morning with six drillers, a powder monkey and an assistant," Midnight stated in part. "We went to the magazine at Seventh Avenue and Twenty-third Street and got twenty-five 9-oz. sticks of 40 per cent dynamite, and before setting off any of it we prepared three blasts.

"The first blast was in only one hole at the bottom of the excavation, and I put three-quarters of a stick of dynamite into it. It was fired at about 7.50 o'clock and cracked the stone above slightly.

"The second blast was the one that preceded the cave-in. It was on the face of the rock, about 13 ft. from the bottom of the excavation, and for it four holes about 9 ft. deep were used. These holes included an area of about 13 ft. Three of the 9-oz. sticks were put into each hole. The third blast, which was never fired, consisted of two holes with three-quarters of a stick in each. Before we began to blast, after all of the holes had been loaded, the 'monkey' took the remaining dynamite and detonators back to the magazine.

"Before the second blast I sent two drill men down toward the Twenty-fourth Street end of the excavation to warn the men working there, and sent five men up with flags to stop street traffic. When I reached the street surface I saw the street car in Seventh Avenue. It is the custom to stop the cars and other traffic about 100 ft. away. I saw one of the flagmen stop this car at about that distance, or perhaps only 90 ft. away, and so I signaled the 'monkey' to fire the charge." The cave-in, according to Midnight, occurred immediately after the explosion of this charge.

When asked if any covering had been placed over the rock previous to the second blast, to keep the debris from flying out and striking the wooden structure, Midnight said it was not customary to cover the rock when such deep holes were used. It is the generally accepted theory that the blast hurled rock against the near-by structure and knocked several beams out of place, and that the others, interdependent upon one another for support went down like a row of dominoes.

By the terms of the contract with the constructing company the city is relieved from any burden of damages for injury to life or property by reason of the accident in the subway. The United States Realty & Improvement Company, which is constructing the subway under Seventh Avenue between Sixteenth and Thirtieth Streets, took the contract for \$2,401,306.75 on Dec. 31, 1913. The work is now about 65 per cent completed. The contract provided that the company give a bond for \$75,000 to insure the faithful performance of the contract, the terms of which protect the city from all liability for damages to persons or property.

The disaster, ghastly enough in its details, undoubtedly created an even more widespread apprehension as to the safety of persons possibly involved in it than the truth of the facts of the occurrence would warrant. Shortly after the accident newspaper extras were circulated, bearing reference in bold but intentionally ambiguous headlines to the "Subway Cave-in." Many readers of the extras believed that an accident had taken place in the present operating subway, rather than the new subway under construction. The misleading headlines naturally produced an epidemic of anxiety among thousands of friends and relatives of those accustomed to travel daily in the operating subway during the morning rush hour.

Ground was recently broken and tunnel work begun on a projected electric mountain railway from the city of Bergen, Norway, to the summit of Mt. Floien. The construction of this railway is estimated to cost \$151,125.

Traffic Count on Chicago Streets

Bureau of Streets Takes Traffic Census of the Loop District in Waste Collection and Pavement Choice Study

To ascertain the effect of traffic density on street cleaning, and for its value in determining the kind of pavement which should be laid on certain streets, Chicago's bureau of streets made a traffic count of all vehicles passing through specified blocks in each direction. This count was made between July 13 and Aug. 17.

The field force used in making the count consisted of twelve men divided into six groups of two each, five squads being for actual service and one for relief. The men were all section foremen from the various city wards. Previous to commencing the work, they were cautioned as to the necessity of accuracy. A team of men was assigned to a block, one on each side of the street, to count the traffic in one direction only. Observations were made in forty-three different blocks, between the hours of 8 a. m. and 12 noon and 1 p. m. and 6 p. m., in rain or shine. On Saturdays the men worked from 8 a. m. to 2 p. m. This afforded a means of counting the noon-hour traffic.

Each traffic counter had a board on which were fastened pads of hourly counter sheets, one being to record rubber-tired vehicles and the other for iron-tired conveyances.

The following traffic statistics at different points in the downtown business and commercial districts were compiled for comparative purposes and show the variations in conditions encountered as well as the congestion at points.

THE DENSEST TRAFFIC IN CHICAGO

The census taken at the Rush Street bridge revealed the fact that at this point traffic is heavier than at any other point in the city. For the eight hours in which the census was taken, figures show that an average of 1700 vehicles per hour cross the bridge during the day, or a vehicle every 2.12 seconds. Between 5 and 6 p. m. the traffic reached the peak point, 2384 vehicles crossing the bridge; an average of a vehicle every 1.9 seconds. The trend of traffic during this hour is north-bound, 1872 conveyances passing over the bridge from the south. The difficulty which a pedestrian encounters in trying to cross the bridge during the rush hour can be imagined with a vehicle of some kind passing every 1.5 seconds. Traffic across the bridge was distributed as follows: Horse-drawn vehicles, 19 per cent; auto trucks of all kinds, 6.31 per cent; automobiles, 74.69 per cent.

THE BUSIEST STREET INTERSECTION

The intersection of State and Madison Streets was found to be the busiest crossing within the loop, an average of 1548 vehicles passing per hour, or one every 2.4 seconds. Street cars were found to run 11.8 seconds apart. Traffic was distributed as follows: Horse-drawn vehicles, 43.2 per cent; auto trucks of all kinds, 7.4 per cent; automobiles, 29.7 per cent, and street cars 19.7 per cent.

Of this traffic 75.7 per cent was on State Street and 24.3 per cent on Madison Street. Traffic north bound in the block between Madison and Washington Streets was 35 per cent heavier than that south bound, this despite the fact that there were 245 more street cars south bound than in any other direction. Figures taken at eleven different points on streets west of State Street show traffic to average 254 vehicles per hour. At eleven different points on streets east of State Street, the average per hour was 192 vehicles.

Between Lake and Adams Streets on State Street an average of 442 vehicles of all descriptions per hour were counted.

To ascertain the length of time spent by vehicles standing backed up to the curb in loading and unloading on South Water Street, and streets in the immediate vicinity, eighty vehicles of outside dealers were timed. These were found to stand at the curb an average of one hour and twenty-seven minutes, while ten other vehicles remained for an average of four hours and nine minutes. The vehicles used for hauling fruit and produce to the commission houses averaged fifteen to thirty minutes in unloading and departing, while a number owned by parties who do a cartage business, after unloading, remained backed up to the curb for an indefinite time.

STREET CARS 14.4 PER CENT OF ALL TRAFFIC

That the new style heavy double-truck street car is an important factor in traffic census as it is in street cleaning may be seen when it is considered that of all the conveyances counted, there were 26,995 street cars or 14.4 per cent of all traffic, and on the streets upon which there are trucks the street cars amounted to 21.1 per cent of the traffic. Of the streets upon which there are regularly routed street cars, Dearborn Street south of Monroe Street had the lightest amount of street car traffic. The greatest amount was found on the three-track State Street line, between Lake and Madison Streets, the street cars being nearly 26 per cent of the total traffic. At the intersection of State and Madison Streets there is an average of one car every 11.8 seconds in all four directions.

ELEVATED TRAINS

All elevated trains entering the loop run in the same direction around the loop. The trains were counted on Wabash Avenue at two points and at one point on Fifth Avenue. Trains were counted according to the part of the city to which they were destined. An idea of the volume of this traffic may be obtained from the tabulation made at the corner of Randolph Street and Wabash Avenue given below.

TABLE SHOWING TRAINS ON AUG. 23, 1915, AS COUNTED AT CORNER OF RANDOLPH STREET AND WABASH AVENUE

Time	Northwestern and South Side El. Rys	Metropolitan All Branches	Oak Park	Totals
7 to 8 a. m.....	44	39	16	99
8 to 9 a. m.....	52	44	24	120
9 to 10 a. m.....	56	41	15	112
10 to 11 a. m.....	42	38	2*	82
11 to 12 a. m.....	48	44	11	103
1 to 2 p. m.....	44	40	12	96
2 to 3 p. m.....	44	42	10	96
3 to 4 p. m.....	44	41	10	95
4 to 5 p. m.....	49	40	13	102
5 to 6 p. m.....	54	47	18	119
Totals for day..	477	416	131	1024

*Between 10 and 11 a. m. Chicago and Oak Park trains were delayed fifty-five minutes.

A factor affecting street cleaning is the litter and newspapers thrown by careless passengers from the car windows of the elevated trains, constantly passing through the Loop district each day. This is a violation of the clean street ordinance, but is a condition hard to correct.

CLASSES OF STREET VEHICLES

Of the 100,727 vehicles used for commercial purposes in the cartage of freight and other commodities, 82.2 per cent were horse drawn and 17.8 per cent were auto trucks of all descriptions. Of the 59,950 carriages, buggies and automobiles used for carrying passengers, 0.9 per cent were carriages, 2.2 per cent were buggies, 19.2 per cent were two-seated automobiles and 77.7 were automobiles with four or more

seats. This gives the percentage of horse-drawn vehicles to automobiles, 3.1 per cent to 96.9 per cent.

The total count showed that all traffic counted in the loop was distributed as follows: Horse-drawn vehicles, 45.1 per cent; motor-driven vehicles other than street cars, 40.5 per cent, and street cars, 14.4 per cent. The average number of vehicles per hour was 258, and the total hours counted was 728.

The estimated tonnage used for each class of vehicle is the same as that adopted by the bureau of highways, Brooklyn, N. Y., which is as follows:

RUBBER TIRED VEHICLES	
Large auto trucks—loaded.....	8 tons
Large auto trucks—empty.....	4 tons
Small auto trucks—loaded.....	3 tons
Small auto trucks—empty.....	1½ tons
Automobiles.....	1¾ tons
Wagons and carriages.....	1½ tons
IRON TIRED VEHICLES	
Three-horse trucks—loaded.....	7½ tons
Three-horse trucks—empty.....	3½ tons
Two-horse wagons—loaded.....	4 tons
Two-horse wagons—empty.....	2 tons
One-horse wagons—loaded.....	2 tons
One-horse wagons—empty.....	1 ton

The entire count was under the direct supervision of Charles Smith and W. J. Galligan, first and second assistant superintendent of streets reporting to Walter Leminger, superintendent of streets.

The Kansas City Viaduct

In a paper presented before the American Society of Civil Engineers on Sept. 1, E. E. Howard presented a description of the new Twelfth Street Trafficway Viaduct in Kansas City, Mo., which is unique in that it is one of the highest reinforced concrete structures of this type that has been built. The viaduct extends across the river bottom between the principal residential and business districts of the city and has a maximum height of 120 ft. With the earth embankment at the ends, it provides a street 60 ft. wide that is on a continuous grade of about 5.5 per cent for a distance of 3500 ft. To accommodate traffic desiring a less steep grade and willing, for such advantage, to travel by a less direct route, a roadway is provided on a lower deck with a grade of about 2.5 per cent.

The upper deck is separated into a roadway 30 ft. wide that is paved with creosoted blocks, a sidewalk 5 ft. wide and a street car space 22 ft. wide. The roadway is separated from the street car space by a concrete curb, and on each side of the structure there is a concrete hand rail. The two electric railway tracks are built with the usual wooden cross-ties set in ballast, so that no other traffic can use the area which they occupy. This arrangement, which is somewhat uneconomical from a highway standpoint, was specified by the city authorities. Iron trolley poles on each side of the street car space support the usual overhead wires. The lower deck provides a single roadway 30 ft. wide that is paved with creosoted block, the longitudinal girders that support this deck extending far enough above the roadway to form side barriers.

The upper deck comprises forty-five deck-girder spans of two girders each, these varying in length from 33 ft. to about 56 ft. There are also the arch spans and two earth-filled approaches. The lower deck comprises twenty-seven through-girder spans of two girders each supported on the same columns as carry the upper deck, a suspended deck under the arch span and earth-filled approaches. The floor slabs are supported on cross-girders and cantilever beams. Both upper and lower roadways are lighted with incandescent electric lights placed above the hand rail for the upper deck of the bridge and on brackets on the columns for the lower deck.

ANNUAL CONVENTION

OCTOBER 4 to 8, 1915

American Association News

ANNUAL CONVENTION
SAN FRANCISCO
OCTOBER 4 TO 8, 1915

The San Francisco Committee on Entertainment Announces Program—Personnel of the Southern California Entertainment Committees—Denver Tramway and Public Service Company Sections Resume Meetings

"WHITE SPECIAL"

The office of H. G. McConnaughy, director of transportation, closed on Sept. 23 and will not open again until Oct. 23. All information from now on regarding the "White Special" must be secured from L. E. Gould, Old Colony Building, Chicago, Ill., who is in charge of the train. This train will leave Chicago at 6.30 p. m. on Oct. 1, over the Chicago Great Western Railroad, arriving at San Francisco at 10.25 a. m., Oct. 4.

"RED SPECIAL"

The "Red Special" pulled out of New York on Thursday with an enthusiastic company of well wishers in attendance. The decorations throughout the train were in red, and each lady was presented with a bouquet of orchids and lilies-of-the-valley. One end of the baggage car had been floored and equipped with a Victrola for dancing. Provision had been made to furnish souvenir postals en route ready stamped for mailing.

SAN FRANCISCO ENTERTAINMENT PROGRAM

The committee on entertainment for the convention has announced the following program:

Oct. 4, 9 p. m.—Reception and ball, Colonial ballroom, St. Francis Hotel.

Oct. 6, 8 p. m.—Electric scintillator drill and fireworks display. Illuminated flight by a member of the exposition aviation corps.

Oct. 7.—American Electric Railway Association golf tournament, Claremont Country Club, Oakland. Members of the golf committee will board special trains at Portland and Ogden.

Oct. 8, 10.45 a. m.—Delegates and ladies will leave Native Sons' Building for the exposition grounds in special buses.

11.30 a. m.—Presentation of bronze plaque by C. C. Moore, president Panama-Pacific International Exposition, to C. Loomis Allen, president American Electric Railway Association, followed by an address on "The Development of the Electric Railway," by James H. McGraw, president McGraw Publishing Company, Inc.

12.40 p. m.—San Francisco Bay trip and sight-seeing tour of Oakland and Berkeley.

In addition to the above a special sight-seeing car and local club privileges can be arranged for by the entertainment committee.

SOUTHERN CALIFORNIA ENTERTAINMENT

The personnel of the southern California committees of entertainment is as follows:

J. McMillan, general chairman, Pacific Electric Railway Company.
K. E. Van Kuran, secretary-treasurer, Westinghouse Electric & Manufacturing Company.
Committee Chairmen:
Finance committee—Paul Shoup, Pacific Electric Railway.
San Diego committee—B. M. Warner, San Diego Electric Railway.
Reception committee—Seymour Swarts, Great Western Smelting & Refining Company.
Publicity committee—D. W. Pontius, Pacific Electric Railway Company.
Program committee—R. H. Husbands, Pierson-Roeding Company.
Club courtesies—C. A. Henderson, Los Angeles Railway.
Transportation committee—A. W. Arlin, General Electric Company.
Barbecue and music—L. O. Lieber, Los Angeles Railway.
Evening entertainment—S. I. Wailes, manufacturers' agent.
Catalina trip—F. F. Small, Pacific Electric Railway.
San Francisco registration—H. H. Hale, Galena Signal Oil Company.

DENVER TRAMWAY COMPANY SECTION

The season of the Denver Tramway Section was opened with the twenty-eighth monthly meeting on Sept. 16. J. L. Adams resigned from the program committee and his place will not be filled for the present. A nominating committee consisting of R. W. Toll, chief engineer; W. M. Casey, superintendent of transportation, and W. H. McAloney, superintendent of rolling stock, was appointed to nominate new officers for the section. The election is to be held next month. The principal speaker was J. S. McGinnis, secretary and commissioner of immigration, who delivered an illustrated lecture on "Let's Know Our City and State."

PUBLIC SERVICE SECTION

The first regular meeting for the season of company section No. 2 was held in Newark, N. J., on Sept. 23. The general program on "Public Service Economics," announced in the issue of the ELECTRIC RAILWAY JOURNAL for Feb. 13, 1915, page 337, was departed from to permit a discussion of the jitney.

Two carefully-prepared and exhaustive papers formed the basis of the discussion, one on "The Jitney—Its Coming and Shortcomings," by A. T. Warner, traffic investigator transportation department and secretary of the section, the other on "Jitney Operating Costs," by R. H. Harrison, executive clerk mechanical department. The first paper traced the history of the jitney in the country as a whole and in New Jersey in particular, detailed statistics for a number of cities being given. Pictures of several types of jitney were thrown upon the screen. The speaker showed very clearly that, as the jitney lessens rather than increases the wealth of the community, whereas the contrary is true with railways, it is economically unsound.

Mr. Harrison gave additional statistics and the results of computations which demonstrated the impracticability of permanent jitney competition. Taking the statement of a member of the local board of public works to the effect that in ten years the jitney would put the railway out of business, he gave the results of calculations to show what this would mean in Newark in the way of street congestion alone. Mr. Harrison also illustrated his talk with views of jitneys and trolley cars.

The papers were discussed by W. B. Graham and J. J. Geddings, division superintendents, who gave additional jitney traffic data. The discussion brought out the fact that while the individual operator does not stay long in the business there is "a fool born every minute" so that the supply is kept up, each operator pocketing his loss as he retires.

A. J. Van Brunt, of the claim department, then showed two new safety motion picture reels staged by the Edison Company and Public Service Company acting jointly. Their purpose is to teach safety lessons by showing the foolishness of many practices of persons using the streets, and the lessons are impressed by touches of heroism and romance.

The topic for the October meeting of the section will be "The Design and Construction of Carhouses and Shops," and the annual election will also be held at this meeting.

COMMUNICATIONS

Cars at Less Than Cost

WESTINGHOUSE ELECTRIC & MANUFACTURING COMPANY
EAST PITTSBURGH, PA., Sept. 20, 1915.

To the Editors:

We have read with keen interest the communication by Ernest Gonzenbach in your issue of Sept. 11. The article is written in Mr. Gonzenbach's usual forceful style, and, as we have come to expect from his letters, it contains points that are worthy of renewed interest by the electric railways, car builders and electrical manufacturers.

The rapid increase in the number of automobiles, auto buses and auto trucks which has taken place in the last few years is undoubtedly responsible for the great uneasiness that prevails among electric railway operators and brings out more clearly than ever the necessity for the most rigid economies in every line. Mr. Gonzenbach is undoubtedly quite right in his statement that the adoption of standard cars, including car bodies, trucks, electrical equipment and air-brake equipment, would effect enormous reductions in the cost of equipments to the operating companies, but he is wrong if he assumes that the automobile manufacturers are the ones who have discovered the economies of manufacturing standard articles in large quantities.

This principle was well established long before automobiles were ever conceived. It has been drilled into railway men, both operators and manufacturers, for many years, and from personal knowledge extending well over the life of electric railroads, I know that it has been the ideal toward which all of us have worked. However, the best that can be hoped for, in the line of standards in the electrical equipment for cars, seems to be a life of two or three years. The difficulty lies in the fact that there are other ideals that must be considered—ideals which conflict with that of standard design and which concern the cost of equipments just as much.

To be more specific, the question of standardization cannot be allowed to block the wheels of progress, and until the field for improvement is more nearly exhausted, or until competition ceases, I can see but small prospect for the standard car. It is more than probable—it is almost certain—that if in the present state of the art Mr. Gonzenbach were offered a car that represented the best of its kind two years ago, he would undoubtedly insist on many changes before he would accept it. In fact, if he were to overlook all of the improvements that have been made in cars and equipments in the last two years, he would run the risk of being declared obsolete himself.

Another reason why it has been so difficult for manufacturers to standardize their equipments actually lies in the efforts of so many operating companies to standardize. This may seem paradoxical, but it is none the less true. For instance, practically every large city railway has certain standards that are peculiar to that line. Self-interest prevents them from adopting standards that are common to other railways, consequently the manufacturers have to keep on making special apparatus for the simple reason that they must make what their customers want. Of course, it costs a great deal more. Manufacturers must keep on developing new apparatus, not only to keep up with the ideas of their own engineers but to meet the improvements that are suggested by operating engineers and at the same time to adhere to many of the standards of the old lines.

It must be recognized that the manufacture of a standard automobile is an entirely different matter from

that of electric car equipments because the vast majority of automobiles go to individuals who have no other cars, or at least have no standards to maintain, and so are perfectly willing to take what is offered, provided it is good. There are probably more than 1000 customers for the automobile companies to one for an electric car equipment, and there is absolutely no reason why the automobile makers should not standardize except for the necessity for keeping up with the improvements. Even then it is possible to manufacture a single car for at least one season and the numbers are so enormous that the cost of tools is relatively small. But do not forget the tombstones marking the resting place of the unfortunate companies who fell or guessed wrong in manufacturing automobiles.

What is the remedy? I believe it lies entirely in the hands of the operating companies. Certainly nothing would please the manufacturers more than to have the American Electric Railway Association exercise its influence so as to make it possible for standard cars to be manufactured. N. W. STORER, General Engineer.

Who Should Keep Way Department Time?

CHICAGO, ILL., Sept. 15, 1915.

To the Editors:

In last week's issue of the *ELECTRIC RAILWAY JOURNAL* an article on "Time Keeping and Cost Records of the Way Department," by S. Gausmann, Brooklyn, N. Y., appeared. In introducing his subject Mr. Gausmann emphasized the two salient points of any accurate time-keeping method, namely, careful selection of time-keepers and a thorough system for checking the men. This is particularly important during the spring, summer and fall months when large construction forces are employed, and the entire way department clerical force is working under pressure. At that time the engineer in charge is too busily engaged in directing the work to devote much time to clerical details, therefore it is important that the clerical work should be carefully planned and well kept up so that information can be secured on short notice if necessary.

Aside from the time-keeping system a phase of this subject presents itself which is important to the way department head because of its relation to the accurate distribution of way costs, namely, shall the way department keep the time and make the distribution, or shall the work be done by the auditing department? Any discussion of this subject will apply to the electrical and mechanical departments as well.

It needs no argument to show that the department head and his assistants are more competent to check the accuracy of the distribution than a clerk in some other department unacquainted with the details of the work in progress. Furthermore, since the time-keepers on the various jobs must of necessity report to the way engineer, if he expects to control the wages of his men, it scarcely appears necessary to take the preparation of the payrolls out of the department. On the other hand, if the supervision of this clerical work is removed and the way department is permitted to devote all its time to the supervision of work under way, the duty of the department head becomes largely an executive one. Moreover, when the payrolls are prepared in the auditing department the work is handled by a force which specializes in accounting matters.

To reach a conclusion in this particular is as difficult as that pertaining to some of the problems involved in the proper distribution of departmental costs. Doubtless there is considerable advantage in having the distribution of costs made by accountants who are unbiased as to the result, but familiarity with the details

WAY DEPARTMENT ENGINEER.

THE NORTHERN OHIO TRACTION & LIGHT COMPANY
AKRON, OHIO, Sept. 13, 1915.

This report traces the work of the crew and movement of each work train from the time the men report for work until they quit for the day. A space is shown for the names of the conductor, motorman and brakeman, with date of report, as well as the time and place at which the crew reported for work and received the train, with the number of the car. This is necessary as they receive the train at different yards on the system; also, they may have reported for work but had to

Assistant Engineer Maintenance of Way.

[illegible]

Horizontal vs. "Festooned" Contact Wires

THE CONNECTICUT COMPANY

NEW HAVEN, CONN., Sept. 22, 1915.

To the Editors:

Referring to Dr. Ing. E. E. Seefehlner's letter of July 31 in the issue of the *ELECTRIC RAILWAY JOURNAL* for Sept. 18, I would state that I have not seen the articles there referred to but shall make it a point to follow up the references.

I am very much interested to know if Dr. Seefehlner has really had experience with operation on a festooned trolley, or whether he is basing his statement simply on the good behavior of the horizontal line.

The life of the collector is a function of so many variables that unless all of the facts are at hand it is not entirely safe to credit the good to any one cause. Dr. Seefehlner will doubtless be interested to note the article in the convention issue of the *JOURNAL* on the maintenance of the Southern Pacific Company's cars and the life of their trolleys, which, according to Mr. Sears, is expected to be 50,000 miles or 80,000 km., against the 42,000 km. of the Vienna-Pressburg bows.

CHARLES RUFUS HARTE,
Construction Engineer.

Starting Resistance of Electric Cars

PURDUE UNIVERSITY

WEST LAFAYETTE, IND., Sept. 16, 1915.

To the Editors:

In the editorial on the above subject which appeared in your issue for Aug. 14, you make the following statements: "There are numerous formulas, with curves based thereon, which indicate a minimum resistance at zero speed, although this condition is known not to exist. * * * It is misleading, therefore, to plot curves from these formulas down to zero speed." I heartily agree with you in this conclusion. Train resistance formulas are usually derived from curves plotted from actual test data. However, such formulas are capable of much broader interpretation than the curves from which they were derived, and curves plotted from such formulas may indicate values which are beyond the limitations of the test results which formed the primary bases of the formulas. For example, most train resistance data have been taken between speeds of 10 m.p.h. and 70 m.p.h., yet curves plotted from formulas derived from such data may be read at any speed.

Most train resistance formulas are of the form:

$$R = A + BS + CS^2$$

where S is the speed and A , B and C are constants.

A study of existing train resistance data leads to the conclusion that, for a given set of conditions, such an equation may be made to represent the relation between train resistance and speed with a fair degree of accuracy for all speeds above the speed at which the train resistance is a minimum. With existing equipments this minimum value obtains somewhere between 5 m.p.h. and 10 m.p.h. The curves of Wellington, Aspinwall, Dennis and others of the earlier investigators plotted, not from their formulas but from their actual test results, indicate that the starting resistance is much higher than the minimum resistance. However, the formulas which have been derived from their results contain no indications of this condition. C. O. Mailloux has pointed out that "the curve of train resistance plotted as a function of speed is really a 'two-branch' curve." (A. I. E. E. *Transactions*, Vol. 23, page 734.) As already noted, that branch of the curve which shows the relation between train resistance and speed for speeds above the one which gives minimum resistance may be represented

by the above equation, but a satisfactory equation has not yet been developed for that branch of the curve which has to do with the lower speeds. We may conclude, therefore, that it is unsafe to use either train resistance formulas of the form $R = A + BS + CS^2$, or curves plotted from them below 10 m.p.h.

The custom of expressing train resistance by an equation of this form without stating explicitly the limits between which the formula is approximately correct is to be condemned. Such custom is certainly not in accord with true engineering ideals of accuracy and good practice, and is apt to be misleading to a large number of engineers who are occasionally required to solve problems in which train resistance is one of the involved factors, but who could hardly be expected to make train resistance specialists out of themselves before attempting the solution of their problem. The curve (*ELECTRIC RAILWAY JOURNAL*, Aug. 7, page 239) to which your editorial refers is an example of a correctly-drawn train resistance-speed curve.

Referring to the abstract from the sixth annual report of the Board of Supervising Engineers, Chicago Traction, contained in your editorial: As I understand the report, two distinct considerations are recognized. One has to do with the "friction of rest." Data pertaining to this consideration for a particular car and set of track conditions are given in my article published in your issue for Aug. 14. Also such data for heavy trains equipped with plain and with ball bearings respectively are given in your issue for Aug. 7, page 239. The second consideration deals with the increase in train resistance during acceleration over that which obtains during free running at the same speed. The data available here are hardly sufficient for even an approximate analysis.

In a communication on the subject which forms the caption of these notes published in your issue for Sept. 4, it was pointed out that it is customary in making calculations where train resistance is an involved factor to assume that during the notching-up period, the train resistance is constant at the value which obtains at the speed corresponding to full voltage and accelerating current, and that the results so obtained had checked very satisfactorily with results of tests. For the purpose of simplifying calculations, it is, of course, common practice with engineers to make certain assumptions, particularly where the use of such assumptions ordinarily does not involve serious error. However, it would seem to be better practice to found assumptions on factors, the values of which are known with a fair degree of accuracy, rather than simply to make an assumption and later to check its accuracy by tests.

As is so well set forth in the communication referred to, it is quite true that "the instances where it (train resistance at starting) is a determining factor in equipment selection, locomotive weight determination or energy consumption are relatively few." That in some instances it is worth considering, Fig. 4, page 239, of your issue for Aug. 7, bears evidence.

Also it might be pointed out that for a given average rate of acceleration that equipment which has the lowest starting resistance will have the lowest peak current during acceleration, other things, of course, being equal. From the standpoint, therefore, of operation and maintenance of electrical equipment of rolling stock, distribution system and substations rolling stock which has low starting resistance seems desirable.

In conclusion, therefore, it seems to me that more data and information on the subject of train resistance at starting and train resistance during the accelerating period are highly desirable.

D. D. EWING,
Assistant Professor of Electrical Engineering.

Equipment and Its Maintenance

Short Descriptions of Labor, Mechanical and Electrical
Practices in Every Department of Electric Railroading

(Contributions from the Men in the Field Are Solicited and Will be Paid for at Special Rates.)

Use of Current for Operating Crane to Remove Trucks from Under Car Bodies

BY R. E. HEWITT, MASTER MECHANIC, SOUTHERN PACIFIC COMPANY ELECTRIC LINES, WEST ALAMEDA, CAL.

As our standard motor truck is exceedingly heavy the work of pinching it out from under a car body with pinch bars, after the car had been raised and placed on standees, was slow and tedious work. As a consequence we conceived the idea of utilizing the current that operates the shop crane for moving the trucks electrically. The method used can be understood from a study of the accompanying illustration.

Overhead and directly in front of the crane operator is a drum from which hangs a four-conductor cable. To the cable is attached a block in which are inserted four standard motor-lead couplers. On the side of the

DEVICE FOR REMOVING TRUCK FROM UNDER CAR BODY
BY THE USE OF ELECTRICITY

drum are four metal rings that give sliding contacts at the terminals of four wires that can be traced to a double-throw switch at the extreme right of the crane-operating cradle.

When it is necessary to remove the trucks from under a car the crane is moved to the point on the floor where the car is standing, the cable is unreeled from the drum and attached to the armature and field leads of one of the motors in the truck, and the double-throw switch at the right in the operator's cradle is reversed cutting off the current from the crane motors and transferring it to the drum. The operator then utilizes the same controlling levers, resistance, etc., that he previously used in manipulating the crane in controlling the motor on the truck, moving the truck forward or backward as desired. As the crane operates on 220 volts, direct current, the power supply is well adapted for the above purpose.

From the description it will be evident that time and labor are saved by this method of utilizing the electric crane outfit.

Trolley Wire and Pantograph Shoe Wear on Annapolis Short Line

BY D. E. CROUSE, ENGINEER

The Annapolis Short Line since 1908 has used various types of pantograph shoes of the sliding type for the collection of both a.c. and d.c. power. From 1908 to 1914 the trolley pressure was 6600 volts a.c., single-phase, 25 cycles. The weight of the car was 50 tons, but since the voltage was high, the current collected was small, in fact, less than 100 amp. The overhead line was of the single catenary type with bracket suspension and with a messenger of 7/16-in. Siemens-Martin strand from which a No. 000 grooved copper contact wire was suspended by means of rigid-pipe hangers. The contact wire wore rapidly, due in part, undoubtedly, to the lack of flexibility in this type of construction.

The pantograph shoe used at this time was of 1/16-in. mild steel, 6 in. wide and 4 ft. long. Its average life was 1000 miles and its cost 26 cents. It was provided with aluminum horns which were altered (as described in the issue of the *ELECTRIC RAILWAY JOURNAL* for March 20, 1915, page 550) to permit greater contact area where the effects of oscillations were severe. The pantograph was controlled by standard Westinghouse electro-pneumatic equipment, and the shoes were lubricated with graphite grease. The life and operation of pantograph shoes of this type were satisfactory, but the wear on the No. 000 trolley wire was abnormal. In five and one-half years, during which there were 120,451 train movements, the copper trolley wire was one-half worn away.

On Jan. 4, 1914, the voltage on the contact wire was changed from 6600 a.c. to 1200 d.c. and the problem of collecting a larger current was introduced. It was desired to retain the operating features which are inherent to the pantograph but at the same time to eliminate the rapid trolley wear. A steel, grooved contact wire of No. 0000 section was therefore erected immediately under the worn No. 000 copper wire, and both were suspended from the messenger by means of full-loop hangers spaced 15 ft. apart. These loop hangers, which were also described in the March 20 issue of this paper, introduced the needed flexibility.

The weight of the 15 ft. of worn wire copper plus that of the new No. 0000 steel wire, when added to the weight of one hanger, gave a total of 16 lb. per point of hanger suspension. As the vertical pressure of the pantograph is maintained at from 12 lb. to 18 lb. the pantograph tension and the weight contact wire and hangers are so nearly balanced that there is little tendency toward the forming of waves in the contact wire between points of support.

Some doubt was felt at first as to the ability of the steel contact shoe to collect from a steel trolley wire the accelerating current of the new 40-ton cars, about 350 amp. The operation demonstrated, however, that there

ANNAPOLIS SHORT LINE—OVERHEAD CONSTRUCTION SHOWING NEW SHOE IN OPERATION

was ample margin for collecting as high as 700 amp. with no burning of the wire or the shoe. The use of the old-style shoes soon developed the fact that the wear had been transferred to a large extent from the contact wire to the pantograph shoes, as the former mileage of 1000 was reduced to 400. To overcome this the style of shoe and horns was radically changed, with the limitation in mind that the greatest weight which the pantograph springs would permit in the horns, shoe and fixtures was 15 lb.

The ease with which the maximum current per car, 350 amp., could be collected suggested cutting down the width of the shoe and increasing its thickness. It was observed further that when the high accelerating current was being collected, the wire was usually in the center of the shoe; for the reason that extreme oscillations did not exist until high speeds were reached. Since the current density was greatest at the center of the shoe it was decided to cut a "dovetail" in both ends of the shoe and thus save weight.

The reduction in width from 6 in. to $4\frac{1}{2}$ in. and the cutting of the "V" in the end of the shoe permitted a $\frac{1}{8}$ -in. mild steel shoe to be substituted for the $\frac{1}{16}$ -in. shoe. In addition, the costly aluminum horns were replaced by $\frac{3}{4}$ -in. x $\frac{3}{4}$ -in. x $\frac{1}{8}$ -in. angle-iron horns. The result of all of these changes was a shoe which costs \$1 and gives an average life of 25,000 miles. The former cost of 26 cents per 1000 miles was reduced to 4 cents, and at the same time the labor charge for replacing

ANNAPOLIS SHORT LINE—PANTOGRAPH FRAME IN RETRACTED POSITION, SHOWING DETAILS OF NEW SHOE

shoes was greatly cut down. The shoes are lubricated, as before, with graphite grease. The control of the pantograph was changed on Jan. 4, 1914, from electro-pneumatic to straight air, as was described in the article referred to. The first mile of steel trolley wire erected on the Annapolis Short Line has been in service for three years and after 72,270 train movements shows a wear of 12 mils.

Practical Views of Special Work—I— The Tongue Switch

BY R. P. WILLIAMS, INSPECTOR OF SPECIAL WORK BROOKLYN RAPID TRANSIT SYSTEM

With the present design of special work the waste is enormous. In nearly thirty years, or since the introduction of the "guaranteed" type, there has been practically no change. Heavier rails were first introduced, and next came the harder rail. With these changes the price of special work has gone steadily upward.

When it was found that, with the use of the built-up type of special work, the intersections of frogs and crossings laminated so quickly as to compel renewal of the individual piece before even the minimum amount of wear was obtained from the abutting arms, the renewable center was introduced to overcome the deficiency in wear. Solid manganese is recommended now for the same purpose. While it is true that layouts will last longer than formerly, comparatively the same condition now obtains as was found to exist with the old style of built-up Bessemer steel construction.

We have an illustration of this fact in Brooklyn at the Park Row loops. This layout was of solid manganese, and, while the frogs lasted five times as long as the guaranteed type, yet when thrown away on account of the dished condition of the intersection, the surface wear in the balance of the piece was scarcely noticeable. Counting the increased cost of the material and the amount of good material thrown away there is no saving. Evidently the fault is in the design, for there can be no economy in throwing away $8\frac{3}{4}$ in. of a 9-in. manganese rail, even if it does last longer than the open-hearth rail.

The writer has had thirty years of experience, divided almost evenly among building, installing and maintaining special work, and offers the following findings and suggestions as his view of a way out of the difficulty. By considering the tongue switch and the crossing the entire ground will be covered.

The tongue switch will be taken up first and the crossing will be discussed in a subsequent article. The objectionable features of the tongue switch are as follows: First, the manganese bed; second, the shape of pocket; third, the uneven wear; fourth, the shape of heel and fastening, and, fifth, the drainage.

The manganese bed was introduced for the same reason as the renewable center. The original built-up tongue switch was made with the tongue level with the head to give smooth riding on the straight run, the high guard appearing only near the heel of the tongue where the wheel tread would not touch it. As a consequence the wheel tread on the straight run wore a groove in the head of the curve rail parallel to the straight gage line. The manganese bed and manganese tongue have evened up the life of the switch, so that under even travel on straight track and curves the three abutting pieces of open-hearth steel rail are about worn out when the parallel ridge appears in the manganese bed. Now consider the switch to have been made of solid manganese and we are back to the original proposition. Obviously, then, this manganese bed must be renewable,

are so designed as to permit of being easily ground out with a small emery or other grinding wheel. Fig. 3 shows a renewable piece at a vital point, for on the keeping up of this guard edge depends the safe facing operation, as well as lengthening the life of the switch as a trailer. Figs. 7 and 8 are cross-sections at the heel showing the amount of metal under the supporting heel portion. It will also be noticed that the arrangements for fastening are all easy of access. The method and principle will be shown in a later article in connection with the crossing.

Home-Made Pinion Puller

BY C. M. FEIST, MASTER MECHANIC SIOUX CITY (IOWA) SERVICE COMPANY

An even distribution of the pressure on both the pinion and the armature shaft while removing pinions is the principle which evolved the pinion puller used by the mechanical department of the Sioux City (Iowa) Service Company. This device consists of four prin-

SIOUX CITY PINION PULLER

cipal parts—a bolted flanged collar, a heavy yoke, a stationary screw jack and a link. These parts assembled for removing a pinion are shown in an accompanying illustration. The screw jack is made adjustable vertically so that it may be centered to fit any size of armature. The head of the screw jack presses against the end of the armature shaft, while the pressure tending to withdraw the pinion is brought to

bear on the flanged collar by the yoke, which in turn is attached to the jack by the link. The lower ends of the yoke are held secure in slots in the floor. After the jack head is brought up tight against the end of the armature shaft, the yoke is struck a blow with the sledge. As a rule one blow is sufficient to loosen the pinion. From the foregoing it will be seen that the pressure employed in removing the pinion is distributed on both the armature shaft and the pinion with the result that neither is injured in the operation.

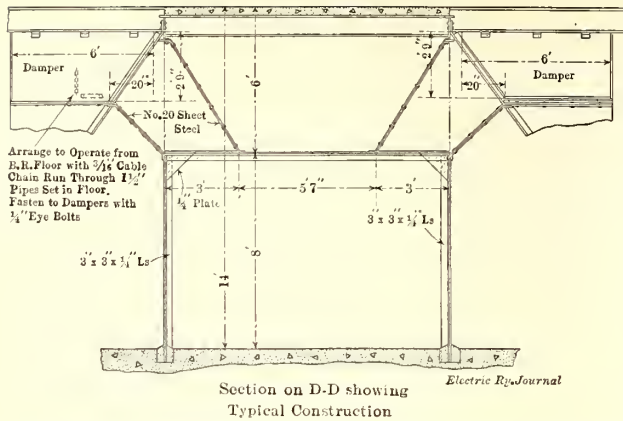

Air Intakes Increase Furnace Capacity

In the 58,500-kw. generating station of the Minneapolis (Minn.) Street Railway Company, an installation of cold-air intakes has increased the furnace capacity from 10 per cent to 15 per cent, and has improved boiler-room economy about 3 per cent. The steam-generating station capacity has been more than doubled during the last few years by the installation of large turbo-generators, new chain grates under the boilers and four new high-capacity stacks. The arrangement of the boiler room conforms to the usual standard, there being fourteen B. & W. 550-hp. boilers installed on each side of a 24-ft. firing aisle. Overhead steel coal bunkers supply coal to these boilers through hoppers and stokers. The boilers have grate surfaces approximately 10 ft. x 11½ ft. in size, and four 14-ft. x 265-ft. stacks furnish a total average draft of 1.6 in. A brief resumé of the growth of this plant was given in the issue of the ELECTRIC RAILWAY JOURNAL for Dec. 13, 1913, page 1250.

When the capacity of the plant was less than 20,000 kw., no difficulty was experienced in getting a sufficient unrestrained supply of air to the grates by way of louvers above the coal bunkers and from the aisle, but when the capacity reached 40,000 kw. and more, the air pressure in the center of the boiler room was from ⅜ in. to ½ in. less than outside, due to resistance of entrance, and to the updraft of the warm air in the room. This occurred particularly during the winter, when the large end doors of the boiler room had to be closed to prevent freezing of pipes and severe discomfort to the fire-room attendants. The large amount of cold air coming through the louvers above the coal bunkers froze the moist coal and necessitated the use of steam jets to thaw it out so that the coal would flow through the chutes to the stokers. This also caused excessive corrosion of the steel bunkers.

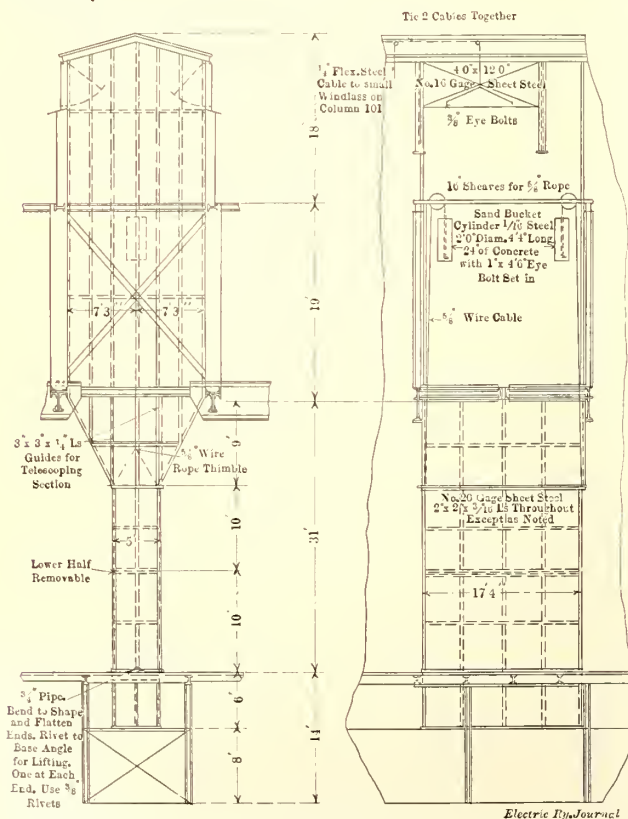

MINNEAPOLIS AIR INTAKE—CROSS-SECTION OF HORIZONTAL DUCT SHOWING TYPICAL CONSTRUCTION

MINNEAPOLIS AIR INTAKE—DETAILS OF HORIZONTAL DUCT
(See section line on preceding illustration)

To remedy this condition two air ducts, each supplying air for fourteen 550-hp. boilers, were built to convey the cold air direct under the stokers. Reference to the illustrations will show that two methods were necessary. At one end of the boilers the intake supplies air from the outside at the boiler-room level and conveys it under the floor to the seven boilers on each side of the firing aisle. At the other end of the boiler room this could not be done and a vertical duct was dropped from the roof to the boiler-room floor and the air duct supplying the boilers direct was also under the floor. The bottom section of the vertical duct was counter-weighted so that it could be lifted out of the way and the opening in the floor was covered with a grating. Dampers at the entrances to the intakes and at ducts leading to the grates control the air supply.

The construction, sizes and material used are clearly shown in the illustrations. The cross-section of the ducts was proportioned so that the velocity of air would be maintained at a reasonable figure when all of the boilers were operating at 200 per cent rating, thus allowing 50 per cent excess air over that theoretically necessary.

MINNEAPOLIS AIR INTAKE—DETAILS OF VERTICAL DUCT

As a result of this installation the boiler room was made comfortable for the men with no appreciable air currents, the boiler capacity was increased due to better draft, and the economy was appreciably improved.

Extensible Trapdoor

In the *ELECTRIC RAILWAY JOURNAL* for Sept. 4 a description of a new extensible vestibule trapdoor made by the O. M. Edwards Company, Syracuse, N. Y., was published in connection with a description of the new cars for the Chicago & Milwaukee Railway. In that description no view was shown of the trapdoor in extended position owing to the fact that no photographs were available at the time, and the view that is reproduced in the accompanying cut shows the extended trapdoor as it would appear at a station platform which provided wider clearances than were necessary for the cars. As may be seen from the illustration, the trap-

EXTENSIBLE VESTIBULE TRAPDOOR

door in this position will fill up quite a large space that may exist between the side of the car and the platform.

The extension or retraction of the trapdoor is effected by the folding handle which can be seen just inside of the vestibule door. At the right-hand side of the trapdoor may be seen also the vestibule door stop, this consisting of a rubber button on the floor plate which interferes with the operation of the vestibule door whenever the trapdoor is extended. It is obvious from the illustration that the vestibule door could not be closed when the trapdoor is in the position shown in the illustration, and this would naturally prevent trainmen from leaving the trapdoor sticking out beyond the side of the car while the train was in motion.

The rail-less electric cars that were placed on the streets of Shanghai several months ago by the Shanghai Tramways and subsequently withdrawn on account of the imperfect roadbed have now been restored, the roads having been rebuilt with concrete foundation and surface so as to be able to bear the weight of the cars. Five cars are being placed in service on one road. A number of improvements have been made in the cars since they were first placed in the service. It is expected that the rail-less system will receive a thorough test, and if successful other routes will be established.

News of Electric Railways

SEEKING TO INITIATE TOLEDO FRANCHISE

Effort Being Made to Put Toledo Grant Before the Voters— Summary of Principal Terms of Grant

Petitions for the initiation of the franchise agreed upon by the Toledo Railways & Light Company and the franchise committee of the City Council of Toledo, Ohio, were put into circulation by the Toledo Franchise Association on Sept. 15. The statement was made that 2000 names were secured in one day. Plans were also made for a number of public meetings. At these meetings it is intended to have speakers explain the provisions of the franchise and reply to those in attendance who desire to ask questions.

The first of this series of meetings was held at Zenobia Hall on the evening of Sept. 17. President Frank Mulholland of the Franchise Association acted as chairman. A feature of the meeting was the indorsement of the franchise by Attorney W. W. Campbell, president of the Municipal Ownership League. Mr. Campbell said that he favored the public ownership of all public utilities, but that he believed the franchise was the best that could be secured at this time.

Councilman M. F. Dotson, chairman of the Council franchise committee and author of the greater part of the franchise, discussed Section 9, which gives the city the right to regulate the operation of cars, to supervise the construction and maintenance of tracks, to decide on the number and kind of cars and to dictate as to the construction of extensions, the building of new tracks and the laying down of crosstown lines.

David A. Merritt, president of the Toledo Taxpayers' League, said he represents home owners and other small taxpayers. What they wanted more than anything else was service. This was demonstrated by the fact that many people used the jitneys and paid a 5-cent fare. Mr. Merritt expressed himself in favor of the franchise.

A vote showed that about 90 per cent of those present had signed the petitions. The most pronounced objection to the franchise, perhaps, was on the provision that the Federal Judge should appoint the third member of the boards of arbitration selected to pass on all matters of difference between the city and the company.

The franchise declares at the outset that the city may acquire the property of the company and operate it under municipal ownership at an appraised value fixed by a board of arbitrators. The securities outstanding at the time of the purchase and the franchise are not to be taken into consideration in determining the value of the property. Only such property is to be purchased as is useful in the operation of the railway.

The road is to be so rearranged by commissioners appointed by the city as to provide the most efficient service. A cross-town line is to be constructed to serve the many workmen employed in the west end of the city. The entire road is to be equipped with pay-as-you-enter or pay-as-you-leave cars within ten months from the date the ordinance becomes effective. Ten months after the ordinance goes into effect, and after the system has been rearranged and provided with cars of the types mentioned, a try-out period of twelve months is to begin. During this period passengers are to be permitted to ride at any hour of the day at the rate of five rides for 15 cents. The city is to have complete control for the twelve months.

While the try-out is being made, a board of arbitration is to value the property used and useful in the operation of a street railway in order that the city may be able to fix a rate of fare to be charged for a period of five years immediately succeeding the try-out period. This rate is to be fixed by Council at least thirty days before the expiration of the period and it is to be sufficient to pay the costs of operation, maintenance including depreciation, taxes and governmental charges and in addition yield a return of 6 per cent on the valuation. This means that the fare is to be based on the actual cost of operation plus 6 per cent on the valuation.

The commissioners appointed by the city are to fix a standard of efficiency, below which no line in the city is to be operated. If the return at the rate of fare fixed by the city for the first five-year period yields a sum any year in excess of the amount necessary for the payment of the items named above, the excess is to be paid into the general fund of the city unless the road has been operated at an efficiency above the standard fixed by the commissioners. In the latter case, the company is to receive one-half of the excess earnings and the other half is to be paid into the general fund of the city. This is the only manner in which the company can receive a return greater than 6 per cent on the valuation of the property as fixed by the arbitrators.

All disputes are to be settled by arbitration. Section 7 contains provisions for taking over the property and its operation as a municipal road. The ordinance does not conflict with the municipal ownership ordinance passed on Aug. 4, 1914. Full and complete control over the operation of the interurban lines within the city limits is provided.

The City Council of Toledo, Ohio, received the report of the special franchise committee on the evening of Sept. 13. The committee filed the ordinance with City Clerk McDonall, as required by law, and preparations were begun for a referendum vote on it. The names of 10 per cent of the voters must be secured to petitions to submit the franchise at a general election and 20 per cent for a special election. The association will endeavor to secure 7000 names. Council merely received and placed on file the report of the franchise committee on Sept. 13. It was signed by Members Hassenzahl, Dotson, Fraser and Redd. Councilman Ruppel, a member of the committee who had never taken any part in the negotiations, opposed the receipt of the report by Council. Members Brown and Hein did not attend the later sessions of the committee and Mr. Brown refused to attach his signature when the opportunity was presented. The report contained no recommendation as to what Council should do with the draft of the franchise prepared. The vote to receive the report stood twelve to six in favor of it. The committee was dismissed.

MARKET STREET, SAN FRANCISCO, CONTROVERSY RESULTS IN CONTEMPT FINDING

Holding Thomas A. Cashin, superintendent of the San Francisco (Cal.) Municipal Railway, alone for trial on contempt charges, Superior Judge Crothers in that city on Sept. 14 rendered a decision purging Mayor Rolph and the three members of the Board of Public Works of charges of contempt of court in directing the operation of the "C" and "D" lines of the municipal railway over lower Market Street, in violation of an injunction which had been issued by the court.

Judge Crothers held that Mr. Cashin, as superintendent of the city lines, was the only man in control of their operations or suspension. He held that neither the operation nor the suspension of municipal street cars was within the scope of the duties to be performed by the Mayor or the Board of Public Works. The Court further held that Judge Sturtevant's injunction was mandatory rather than prohibitive, and that therefore under the law the appeal taken to the State Supreme Court can in effect stay the operation of the restraining order and permit the continued operation of "G" and "D" line cars pending the outcome of the appeal.

The decision handed down by Judge Crothers deals only with the case between the city and the United Railroads. The decision in the cases brought by the Sutter Street Railway is held in reserve.

Following the exoneration of Mayor Rolph from contempt charges, Mr. Cashin was sentenced to pay a fine of \$250 or serve two days in jail for running cars on lower Market Street tracks in disobedience to the injunction issued by Judge Sturtevant. Mr. Cashin obtained a twenty-four-hour stay of execution and on the expiration of this time the fine was paid.

AMALGAMATED ASSOCIATION AGAINST REPEAL OF ARBITRATION CLAUSE

President Mahon Raps Practice of Putting Attorneys on Boards of Arbitration

The feature of the closing sessions of the convention of the Amalgamated Association of Street & Electric Railway Employees of America at Rochester, N. Y., was the overwhelming vote against the proposal to repeal the arbitration clause in the constitution of the association. The proposal came before the convention on a recommendation by the law committee that the arbitration provision be retained. A motion to non-concur in the committee's recommendation was made. Outside of the delegates from the Bay State Street Railway, Boston, the opposition to arbitration found little support.

President William D. Mahon had declared in favor of the arbitration clause in his annual report, read early in the week. One account of the passage at arms over the arbitration proposal said:

"In a characteristic address, President Mahon declaimed against the proposal to strike the arbitration clause from the constitution of the association. He declared that in two-thirds of the cases of disagreement with employers, street-car men would find that public sentiment would force arbitration of the questions at issue, regardless of whether the constitution provided for it. Going into the history of arbitration in recent New England troubles of the street railway employees and their employers, President Mahon rapped the practice of putting attorneys on boards of arbitration. He said that in virtually every case the results of arbitration depended upon the selection of the arbitrators, and under the laws of the association the railway workers can say what questions will be submitted to arbitration, how long the arbitrators can sit and when their decision must be given. Addressing his remarks to the insurgent Massachusetts delegates, President Mahon told them they had had arbitration and under the laws of their organization they would have to live up to the awards of the arbitrators. He warned them, when next a similar situation arose, not to choose attorneys as arbitrators, and intimated that if they handled the situation in the right way they would have no complaint to make at the result."

A resolution which was adopted called for an investigation of the Cleveland 3-cent car lines.

LEHIGH VALLEY TRANSIT SPENDING \$375,000

The Lehigh Valley Transit Company, Allentown, Pa., is spending \$375,000 this year in improvements. The changes that are being made extend to practically every department of activity of the company. The east-bound track between Allentown and Bethlehem has been rebuilt to Sixth and Hamilton Streets, Allentown, and it has been determined to build a double track at West Bethlehem, where there are 1600 ft. of single track. The laying of the track will be begun in a short time. The track on Main Street, Slatington, will be rebuilt from the Lehigh Valley station to Trout Creek Bridge. The track on North Fourth Street, Allentown, is being rebuilt from Greenleaf to Steckel's Bridge and the street is being paved with brick on a concrete base. The stretch from Washington to Greenleaf Street was rebuilt last year on the supposition that the city would at that time pave this street. The company will do its share of paving on Seventeenth Street from Turner to Gordon, and as soon as the city is ready will reconstruct the tracks on Hamilton from Sixth to Seventh. On the Nazareth line a stretch of 1500 ft. has been reconstructed on private right-of-way, and some sharp curves eliminated.

Six new bridges have been constructed and six rebuilt. The new bridges span the Jordan at Steckel's, the Perkiomen on the Emaus line, Jones's on the Chestnut Hill division, the Philadelphia & Reading Railway tracks at Ambler and the Jordan at Iron Bridge on the Slatington division. Underfeed stokers are being installed beneath six of the boilers at the Front Street power house. The company is also installing transformers and regulators in the various municipalities through which its lines run.

There are some notable improvements on the Philadelphia division. The track is being ballasted between Quaker-

town and Perkasio. On the Chestnut Hill division the adjustment has been changed, curves eliminated and the track raised where necessary.

In line with recommendations by the safety-first committee, a special point has been made over the entire system, with the consent of adjoining property owners, of trimming all trees, shrubbery and underbrush, to provide a clear view at crossings. A number of new automatic signal bells and several hundred additional warning signs have been placed at crossings, and approach signs have been erected 300 ft. from crossings, to caution autoists, teams and pedestrians. When this work is completed there will be 600 warning signs along the line.

To take care of the increasing business on the Philadelphia division the company is arranging to increase the power facilities, it being planned in 1916 to run two and three-car trains the entire distance from Philadelphia to Allentown. During the heavy traffic of the present summer two-car trains were run daily between the cities, leaving Allentown for Philadelphia at 8 a. m. and returning from Sixty-ninth Street, Philadelphia, at 5 p. m. Saturdays, Sundays and holidays two-car trains were run every hour.

H. R. Fehr, president of the company, has been giving a great deal of attention to getting the Easton division into shape by the elimination of curves and the rebuilding of portions of the line. These improvements on the line to Easton will lessen the running time between the two cities ten minutes.

For the betterment of the limited service between Allentown and Easton the company has had The J. G. Brill Company build a number of all-steel cars. The first of these cars, No. 214, was placed in service on Aug. 12.

All tracks in South Easton have been rebuilt with 105-lb. T-rails on creosoted ties. Adjoining the carhouse at Seventeenth and Washington Street, Easton, the company has purchased a tract for the enlargement of the carhouse and shops.

The expenditures on the Easton division will amount to \$110,000. As previously stated the expenditures for the improvement on the entire system will amount this season to upwards of \$375,000.

I. R. T. BASEBALL SEASON CLOSED

The baseball season among the employees of the Interborough Rapid Transit Company, New York, N. Y., was brought to a close on Saturday, Sept. 11, with a game of ball between the car equipment division of the company and a team representing the Erie Railroad, and a shore dinner at the Brighton Beach Casino. On the Interborough system there is a league of eight clubs from various divisions of the service, and for the second time in succession the honors have been won by the men from the car equipment department. They won fourteen out of sixteen games, and then with apparently little respect for their guests at Hedley Field on Sept. 11 they smothered the Erie team. More than 400 invitations to both the game and the clambake were sent to officials of the State and city administrations, members and officials of the Public Service Commission, the executive officials of all the prominent electrical transportation systems in the East and to many trunk line officials east of the Mississippi River. The pennant was presented to the car equipment team at the dinner, gold medals were pinned on the individual members of the team and a cup donated by Harry M. Hempstead, president of the New York Giants, was awarded to the league player with the best all-around record. Among the speakers were Frank Hedley, vice-president and general manager of the Interborough Company; Supreme Court Justice Luke D. Stapleton, ex-Corporation Counsel John Whalen of New York and H. H. Vreeland, director of welfare of the Interborough Company.

A game is announced to be played at Ebbetts Field, the home of the Brooklyn National team, on Sept. 29 between the champions of the Interborough and an all-star team from the league of clubs on the Brooklyn Rapid Transit System. At Dexter Park, Brooklyn, on Sept. 23, the Brooklyn all-star team defeated a team of the Hudson & Manhattan Railroad by the score of 16 to 0. Deutsch, pitching for Brooklyn, allowed only three hits. One error was made behind him.

COLUMBIA STRIKE SETTLED

The strike of the employees of the Columbia Railway, Gas & Electric Company, Columbia, S. C., in progress about a week, was settled on Sept. 18, mainly through the efforts of Governor Richard I. Manning. With two exceptions the men on strike will all be taken back by the company. In future all differences will be submitted to arbitration. The strike was precipitated by differences between the men and the company over questions of fare accounting. In a statement which the Governor issued following the settlement of the strike he said:

"I am highly gratified at the peaceful and happy solution of the differences between the car men and the street railway company. I feel that the pleasant and prompt settlement of differences was brought about because of the desire for justice, and I am glad that justice has prevailed. One especially pleasing point is that under the agreement all differences will be settled by arbitration and this should totally eliminate all danger of strikes and lockouts in the future."

RHODE ISLAND ARBITRATION HEARINGS

In the wages arbitration hearings of the Rhode Island Company at Providence last week, John P. Farnsworth, a federal trustee of the company, testified that if an increase in pay was granted to the employees by the board, the capital of the company would more than likely be impaired, with possible receivership, and in the event of the latter the city of Providence would probably lose its contract with the company, at a cost of about \$150,000 a year. In the last eight years only 15 per cent of the gross earnings had been used in maintenance, although 20 per cent should have been thus applied. The additional 5 per cent in this period amounted to \$1,915,148. This ought to have gone into the property.

Mr. Farnsworth stated that since 1912 the receipts from transportation had not shown the normal gain commensurate with the growth of the territory. This should be about 6 per cent yearly, according to the reports of B. J. Arnold and W. J. Lewis. Since 1909 receipts had fallen off, with a deficit for 1915, aggravated by the increased volume of transfers. The witness called attention to the heavy inroads made by the jitney in the Providence district. Such competition was not contemplated by the company in making its contract with the city—an agreement that gave the city 5 per cent of the gross receipts and one-third the cost of widening and improving new streets, while the company also paved between the tracks and 18 in. outside. Mr. Farnsworth also said that the 5 per cent rentals paid on leased lines were not excessive in view of their physical valuation.

It was pointed out that the company must spend \$800,000 this year in extensions and improvements. The company's charter and contracts precluded increasing fares unless by consent of the Assembly. The company was economically operated, the cost of power was low, but the cost of labor had increased since 1910 to a point where it is probably larger at present than in any other city under similar conditions. For extensions and improvements in the next five years \$10,000,000 was needed, and even with wages as they are it will be difficult to secure this new capital without the inducement of a much larger interest rate.

A. E. Potter, president of the Rhode Island Company, pointed out that official salaries were smaller in the company than on the Boston Elevated Railway and Bay State Street Railway. He stated that if the company could arrange its schedules as it saw fit, within the hours of agreement with the union, it could eliminate about 150 men in summer and 300 in winter, guaranteeing the extra men six hours' work a day at a good wage. He also testified in regard to the fare accounting methods which are in use by the company.

Prof. Albert S. Richey of the Worcester (Mass.) Polytechnic Institute took the stand in rebuttal to the testimony of Arthur Sturgis, Boston, relative to the cost of living. The witness said that Streightoff, John Mitchell and others set the minimum-living wage at \$600 to \$650 a year instead of at \$1,000 as advanced by Mr. Sturgis. The average wage in Providence in 1913, as reported in connection with the Rhode Island workmen's compensation act, was \$539.

Transportation employees received an average of \$740. Professor Richey stated that according to the Wholesale Price Bulletin of the United States Bureau of Labor Statistics, clothing advanced 15.8 per cent from 1900 to 1915 instead of 30 per cent as claimed by Mr. Sturgis. The witness said that according to Streightoff there were at least 5,000,000 industrial workmen in the United States earning \$600 or less a year. A chart was introduced showing a decline of 4 per cent in food prices from January to June, 1915, from the average of 1914.

James H. Vahey, counsel for the men, cross-examined the witnesses particularly with respect to the financial history of the company involving the various leases and the intercorporate relations with the New York, New Haven & Hartford Railroad.

PROSPECTS OF NEW DES MOINES GRANT

The Des Moines (Iowa) City Railway will be operating under the proposed new franchise, agreed to by the company and the City Council, by Jan. 1, 1916, unless plans of the company and the city miscarry. The Council will submit to a vote of the people, at a special election, a franchise proposed by the Des Moines Chamber of Commerce and accepted by the city and the company with slight alterations.

Sentiment in the city appears to be overwhelmingly in favor of a final settlement of the franchise question on the basis now offered, and when the franchise is accepted, the company will be sure of its right to operate in Des Moines for the first time since 1900, when litigation involving the validity of the franchise held by the company was begun by the city. This long fight now seems likely to end with a franchise practically the same as the one under which the company then was operating. The new franchise will provide six fares for a quarter, half-fare for school children, a guarantee of service as good as the best in any city of the nation the same size as Des Moines, and a valuation of \$5,000,000 as of the present time if the city decides to buy the property within twenty-five years, which is the term of the franchise. No valuation is fixed for the purpose of determining profits. The company guarantees the service and takes its chances on the profits.

Emil G. Schmidt, president of the company, states that \$1,500,000 in improvements will be spent as soon as the franchise is in effect. These will include twenty-five new cars, the construction of several new lines, a complete overhauling and rebuilding of the present system, a large amount of paving, and the establishment of loop and crosstown services.

Des Moines is rejoicing at the prospect of the settlement of the long standing controversy. Newspapers express the opinion, editorially, that Des Moines would have been better off had the fifteen years' fight been settled fifteen years ago by arbitration between the city and the company. This opinion is almost unanimously subscribed to by citizens of the city.

Recovering Cars Abandoned on Causeway.—Two interurban cars and a work car have been recovered by the Galveston-Houston Electric Railway from the debris of the Galveston causeway where they were abandoned on Aug. 16. They have been taken to Houston for overhauling. Officials of the railroads entering Galveston have announced that the causeway will be rebuilt at an estimated cost of \$1,500,000.

Chicago Surface Lines' Club Has Outing.—The first annual outing of the Surface Lines' Club of Chicago, Ill., was held at Riverview Park Picnic Grove on Sept. 18, 1915. This club was organized last spring and now has a membership of 506. The members are from the departmental offices of the Chicago Surface Lines. In the afternoon there was a baseball game between the electrical and the engineering departments, followed by races and prizes for everybody.

Newport Franchise Matter Still Unsettled.—Another attempt of the Newport Business Men's Club to adjust the rental that the Cincinnati, Newport & Covington Railway shall pay after the expiration of its franchise failed on the evening of Sept. 10. Members of the club suggested several sums between \$6,000 and \$7,500 as reasonable, but the City Commissioners held out for \$12,000 a year. The

company has expressed a willingness to pay \$3,000. It is said that the company will enter litigation on the question of its perpetual rights to the use of the streets rather than pay more than it has offered.
